

Über dieses Buch

Dies ist ein digitales Exemplar eines Buches, das seit Generationen in den Regalen der Bibliotheken aufbewahrt wurde, bevor es von Google im Rahmen eines Projekts, mit dem die Bücher dieser Welt online verfügbar gemacht werden sollen, sorgfältig gescannt wurde.

Das Buch hat das Urheberrecht überdauert und kann nun öffentlich zugänglich gemacht werden. Ein öffentlich zugängliches Buch ist ein Buch, das niemals Urheberrechten unterlag oder bei dem die Schutzfrist des Urheberrechts abgelaufen ist. Ob ein Buch öffentlich zugänglich ist, kann von Land zu Land unterschiedlich sein. Öffentlich zugängliche Bücher sind unser Tor zur Vergangenheit und stellen ein geschichtliches, kulturelles und wissenschaftliches Vermögen dar, das häufig nur schwierig zu entdecken ist.

Gebrauchsspuren, Anmerkungen und andere Randbemerkungen, die im Originalband enthalten sind, finden sich auch in dieser Datei – eine Erinnerung an die lange Reise, die das Buch vom Verleger zu einer Bibliothek und weiter zu Ihnen hinter sich gebracht hat.

Nutzungsrichtlinien

Google ist stolz, mit Bibliotheken in partnerschaftlicher Zusammenarbeit öffentlich zugängliches Material zu digitalisieren und einer breiten Masse zugänglich zu machen. Öffentlich zugängliche Bücher gehören der Öffentlichkeit, und wir sind nur ihre Hüter. Nichtsdestotrotz ist diese Arbeit kostspielig. Um diese Ressource weiterhin zur Verfügung stellen zu können, haben wir Schritte unternommen, um den Missbrauch durch kommerzielle Parteien zu verhindern. Dazu gehören technische Einschränkungen für automatisierte Abfragen.

Wir bitten Sie um Einhaltung folgender Richtlinien:

+ *Nutzung der Dateien zu nichtkommerziellen Zwecken* Wir haben Google Buchsuche für Endanwender konzipiert und möchten, dass Sie diese Dateien nur für persönliche, nichtkommerzielle Zwecke verwenden.

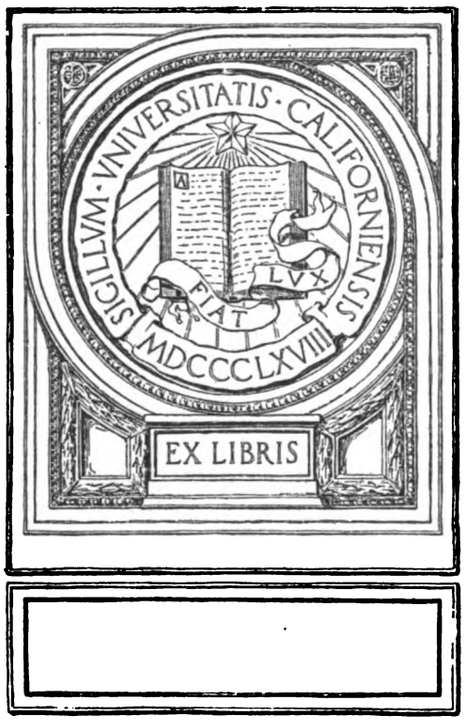
+ *Keine automatisierten Abfragen* Senden Sie keine automatisierten Abfragen irgendwelcher Art an das Google-System. Wenn Sie Recherchen über maschinelle Übersetzung, optische Zeichenerkennung oder andere Bereiche durchführen, in denen der Zugang zu Text in großen Mengen nützlich ist, wenden Sie sich bitte an uns. Wir fördern die Nutzung des öffentlich zugänglichen Materials für diese Zwecke und können Ihnen unter Umständen helfen.

+ *Beibehaltung von Google-Markenelementen* Das "Wasserzeichen" von Google, das Sie in jeder Datei finden, ist wichtig zur Information über dieses Projekt und hilft den Anwendern weiteres Material über Google Buchsuche zu finden. Bitte entfernen Sie das Wasserzeichen nicht.

+ *Bewegen Sie sich innerhalb der Legalität* Unabhängig von Ihrem Verwendungszweck müssen Sie sich Ihrer Verantwortung bewusst sein, sicherzustellen, dass Ihre Nutzung legal ist. Gehen Sie nicht davon aus, dass ein Buch, das nach unserem Dafürhalten für Nutzer in den USA öffentlich zugänglich ist, auch für Nutzer in anderen Ländern öffentlich zugänglich ist. Ob ein Buch noch dem Urheberrecht unterliegt, ist von Land zu Land verschieden. Wir können keine Beratung leisten, ob eine bestimmte Nutzung eines bestimmten Buches gesetzlich zulässig ist. Gehen Sie nicht davon aus, dass das Erscheinen eines Buchs in Google Buchsuche bedeutet, dass es in jeder Form und überall auf der Welt verwendet werden kann. Eine Urheberrechtsverletzung kann schwerwiegende Folgen haben.

Über Google Buchsuche

Das Ziel von Google besteht darin, die weltweiten Informationen zu organisieren und allgemein nutzbar und zugänglich zu machen. Google Buchsuche hilft Lesern dabei, die Bücher dieser Welt zu entdecken, und unterstützt Autoren und Verleger dabei, neue Zielgruppen zu erreichen. Den gesamten Buchtext können Sie im Internet unter `http://books.google.com` durchsuchen.



This is a reproduction of a library book that was digitized by Google as part of an ongoing effort to preserve the information in books and make it universally accessible.

Architects' War Committee.

ARCHITECTS in need of employment in consequence of the War are invited to submit their names to the Hon. Secretary of the Professional Employment Committee of the Architects' War Committee at 28 Bedford Square, London, W.C. Applications can only be considered from bonâ fide architects dependent upon their profession for a living, whose present difficulties are caused by the War, and who are not eligible for military service. All cases are dealt with in confidence by a small Sub-Committee.

"THE ARCHITECT" Students' Sketching and Measuring Club

With the view of encouraging amongst architectural students the sketching and measuring of old work, the Proprietors of "The Architect" have decided to establish a Students' Sketching and Measuring Club in connection with this journal.

A separate subject will be set and a money prize given each month, and in July a Travelling Studentship will be awarded to the student who has submitted the best aggregate of work during the year.

SUBJECT FOR JANUARY, 1915.

A measured drawing or drawings with perspective sketch of a piece of furniture executed in wood, of not later date than 1800 A.D.

Conditions.

1. There is no restriction on the size of the drawing to be sent in by each competitor, but only one subject is to be submitted.

2. The subject drawn need not necessarily be in its original position, but may be in a museum or elsewhere.

3. Each drawing is to be accompanied by a short historical and architectural description.

4. A prize of Two Guineas will be given to the author of the drawings considered best by the Editor, or at his discretion the amount may be divided between the contributors. All drawings will be returned to their authors.

5. The drawing to which the prize is awarded will, if suitable, be published in *The Architect*; but the Editor reserves the right of publication without payment of any other drawing sent in.

6. Drawings are to be delivered at the office of *The Architect*, addressed to the Editor, and marked outside "Sketching and Measuring Club," on or before Saturday, January 30, 1915.

7. Each drawing is to be accompanied by a coupon (which will be found below) properly filled up.

8. A criticism on the drawings sent in will be published in *The Architect*, and reference will be made to each under the name of the author or a *nom de plume*. (*See coupon.*)

9. Every reasonable care will be taken of drawings sent in, but the Proprietors of *The Architect* will not be responsible for any injury or loss that may occur.

10. The decision of the Editor of *The Architect* shall be final and without appeal in all matters connected with the Students' Sketching and Measuring Club.

11. The winners of the Travelling Studentships, 1910, 1911, 1912, 1913 and 1914 will be *hors concours* for future Competitions of the Club.

SUBJECT FOR FEBRUARY, 1915.

A drawing approximately full size of a piece of carved ornament drawn freehand and shaded in monochrome brushwork.

SUBJECT FOR MARCH, 1915.

A measured drawing or drawings with details of a piece of wrought-iron work of eighteenth century date.

The conditions relating to the subjects for February and March will be published during those months.

Conditions of the Travelling Studentship.

1. The Travelling Studentship will be awarded in July 1915 to the author of the best work sent in during the months of July 1914 to June 1915 (inclusive). In the case of students who send in more than one drawing or set of drawings in any one month, the Editor will in making his award select one only from the work of each month to count in the competition for the Studentship.

2. The value of the Studentship will be Ten Pounds, and the holder will be required to make a sketching tour of a fortnight's duration in a district to be approved by the Editor.

3. The sum of Ten Pounds will be paid in two instalments, half before the student starts on his tour, and half when after his return he shall have submitted to the Editor satisfactory work executed during the tour.

4. The proprietors of *The Architect* shall have the sole right of publication of the whole or any part of the work executed by the student during his tour.

5. The decision of the Editor of *The Architect* shall be final and without appeal in all matters connected with the Travelling Studentship.

"THE ARCHITECT" SKETCHING AND MEASURING CLUB.

COUPON TO BE SENT IN WITH DRAWING.

To the Editor of "The Architect."

I herewith submit for January, 1915, the drawing described below, and I declare that the same has been entirely executed by myself. I hereby agree to the conditions published in "The Architect," both as regards the subject for this month and as regards the Travelling Studentship.

FORTHCOMING EVENTS.

Monday, January 4.

Royal Institute of British Architects: Business Meeting, at 8 P.M.

Wednesday, January 6.

Institute of Sanitary Engineers: Presidential Address at Caxton Hall, Westminster, at 8 P.M.

Monday, January 11.

Surveyors' Institution: Adjourned Discussion on the Papers delivered by Mr. Andrew Young (Member of Council) and Mr. L. O. Mathews (Fellow) on "The Report of the Land Enquiry Committee on the Acquisition of Land," to be reopened by Mr. Howard Martin (Past-President), at 8 P.M.

1915.

In all sincerity we heartily wish all our readers a Happy and Prosperous New Year, and this although we cannot feel that as yet the outlook appears particularly bright. The past year has, for architecture and the building trade, been a chequered one. A year ago we were troubled with the prospect of a peculiarly severe struggle between employers and employed. This difference, like many others, has vanished under the compelling necessity for national union in the face of the greatest danger that has ever threatened our national existence and in our participation in the greatest war recorded in history.

And now, at the commencement of another year, we may well consider how we stand. The building trade at the present moment undoubtedly shares in the general condition of labour, which, after five months of war, shows a remarkably small proportion of unemployment, at least as far as the returns made by the various trade unions correctly represent the facts. Of course, as we have repeatedly pointed out, these returns do not necessarily exactly indicate the true conditions with regard to unemployment. For the unions are, as a rule, composed of members whose normal condition is that of employment, and not of those who suffer from chronic irregularity of employment. Some unions include a far larger proportion of the workers in their particular trade than do others, and the unions connected with building are amongst those who enroll only a small proportion of the actual workers in building trades, and hence their returns do not indicate with infallible accuracy the actual position.

The records of pauperism and Poor Law relief show that poverty has decreased since the war began, and thus strengthens the evidence afforded from the trade union returns. So far for statistics. The personal experience of ourselves and our friends shows that building operations are sufficiently active to prevent any evidence of serious unemployment, but the reason for this activity is not altogether comforting. By reason of the building trade dispute in the early part of the year many contracts, particularly in London, were held up, and work on these has now been resumed and is being actively prosecuted. So that the normal amount of building in progress has added to it the work that should have been done months ago, and this it is that has chiefly caused the condition, which we may admit does exist, that unemployment in the building trade is not at present above the normal. But this causal factor is aided also by exceptional employment, directly occasioned by the war, in the hurried building of temporary accommodation for soldiers, in training or in mending, in the equally hurried erection of accommodation, temporary or permanent, for manufacture of warlike implements, munitions, and equipment.

The nation cannot spend a million pounds a day on the war without giving employment to others than those who are fighting or learning to fight. Neither can it take a million men away from their ordinary occupations, or even unoccupation, without reducing the percentage of unemployment. With these diminishing causes of unemployment succeeding in maintaining the normal amount of employment amongst operatives in the building trade, it is clearly evident that there has been a decline in other directions, and this decline has particularly affected those descriptions of buildings with which architects have most to do, so that unemployment amongst architects has reached a very high level.

We must expect that this present state of unemployment amongst architects will result in a subsequent increase of unemployment amongst those whose function it is to put their designs into execution, unless the architects are able very shortly to get to work again.

Digitized by Google

What, then, is the prospect of 1915 for the speedy resumption of activity by architects? It can scarcely be expected during the continuance of the war. For although the 350 millions of the war loan is being to a very large extent poured into the pockets of the workmen and the coffers of the employers and middlemen who handle contracts, these will scarcely have either leisure or inclination to spend their profits whilst all their energies and all their capital are feverishly employed in making still further profits. It is quite true that the rush has been most pronounced whilst the new Army has been in course of training and equipment, but the maintenance of that Army when it has crossed the Channel means still more munitions and still more equipment, both for them and for the 60 per cent. of new recruits who, according to military teaching, are needed to keep an Army in the field up to its full strength.

Whilst, therefore, we may see a possibility that when Kitchener's Army is in the field there may be available for expenditure under the direction of architects some of the profits made in its preparation, it can hardly be expected that much will be done in this direction, for there will still remain a certain amount of timidity in the investment of capital, a certain amount of unreadiness to divert profits from further business to bricks and mortar, an unquestionable reluctance to expenditure on anything that savours of luxury and comfort rather than of necessity or charity. Architecture suffers in spite of the existence of unemployment in the building trade by reason of the dislocation of the normal operations of building, and architecture can only revive by the reduction of the dislocation or by a fresh adaptation to the new conditions.

It is clear now to all of us that modern conditions of fighting tend to make wars lengthy. The immense numbers engaged, the great extent of country occupied by actual combatants, the intensely destructive nature of modern armaments, prevent spectacular catastrophes and crushing defeats inflicted by one side on the other. Attrition is a slow process, and, whilst we may have full confidence that our own nation and its Allies possess the harder and bigger grindstone, it is impossible for us to say whether that of our enemy will crack before or after the end of 1915.

We may, if we please, comfort ourselves—or amuse ourselves—in the coincidence that the 14's in history have frequently been marked by confusion and chaos, and the '15's have often been years of fresh starts and buildings-up. 1215 saw laid the foundations of English liberty, with Magna Charta; Agincourt was won in 1415; 1715 saw George I. firmly established on his throne after the Scotch rebellion; 1815 saw Waterloo and the commencement of the hundred years' peace with our kinsmen across the Atlantic. May 1915 see the commencement of another hundred years' peace, and with it prosperity for the art of architecture.

ST. BARNABAS CHURCH, GILLINGHAM, KENT.

THIS church, of which the first portion was erected some few years ago, has now been completed by the building of the vestries and morning chapel.

The builder of this portion was Mr. A. H. Horne, of Rainham, Kent.

The church is built of local red sand-faced bricks and Monks Park stone from the Bath Stone Firms, Ltd. The roofs are of open timber construction, boarded on the back of the rafters and covered externally with Broseley tiles. The glazing was supplied and fixed by Messrs. James & Co., of Willesden; the wood-block floors by Messrs. Jefferies & Co., of Camberwell; the tiled floors by Messrs. Carter & Co., of Albert Embankment; the ironmongery by Messrs. Hart, Sons, Peard & Co., of London; and the heating and lighting by Messrs. Buckler & Beach, of Chelsea.

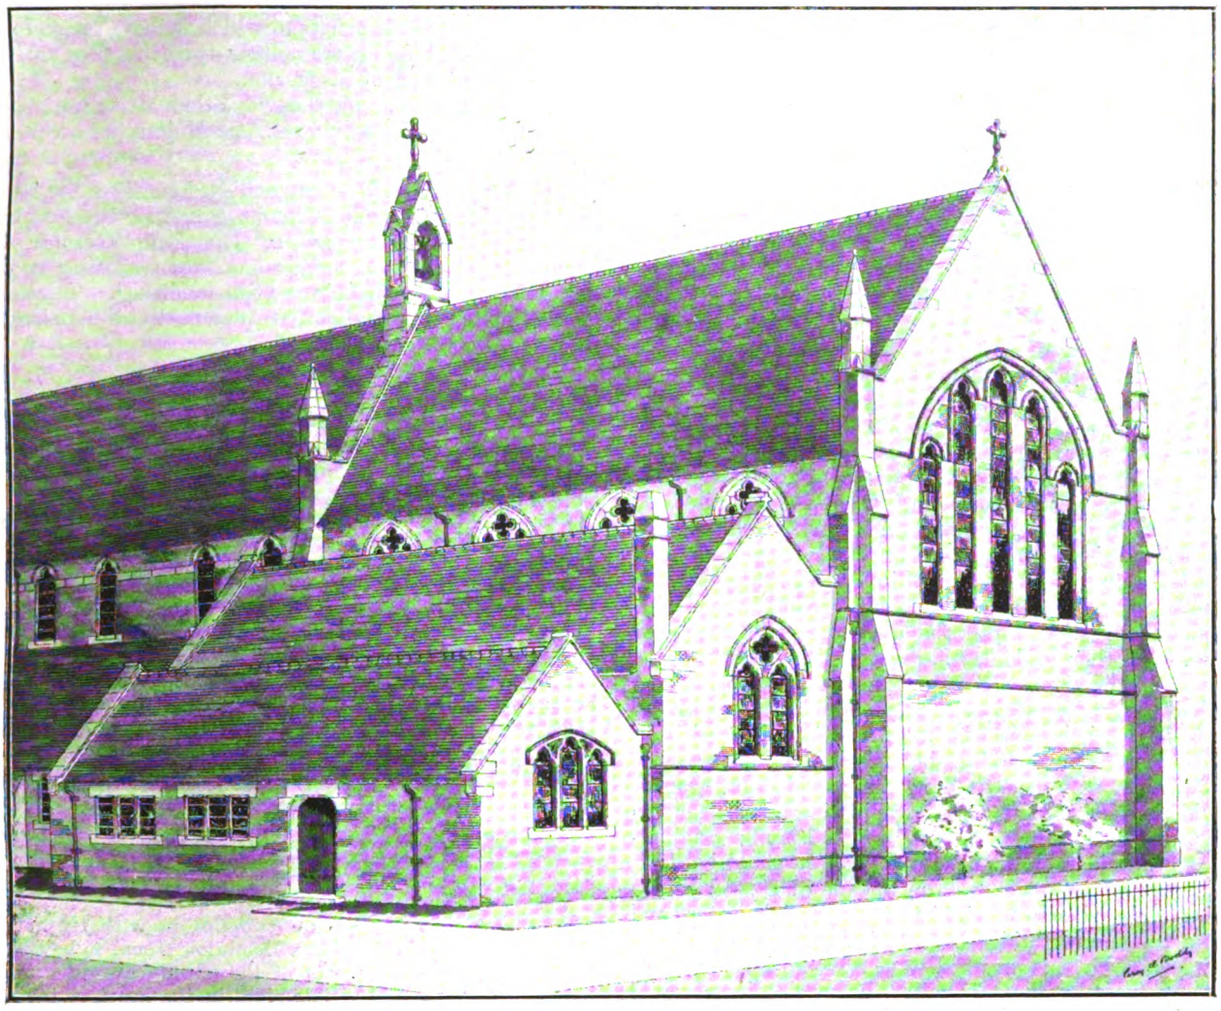
The work has been carried out from the designs and under the superintendence of Messrs. Cutts, Davis & Boddy, architects.

NOTES AND COMMENTS.

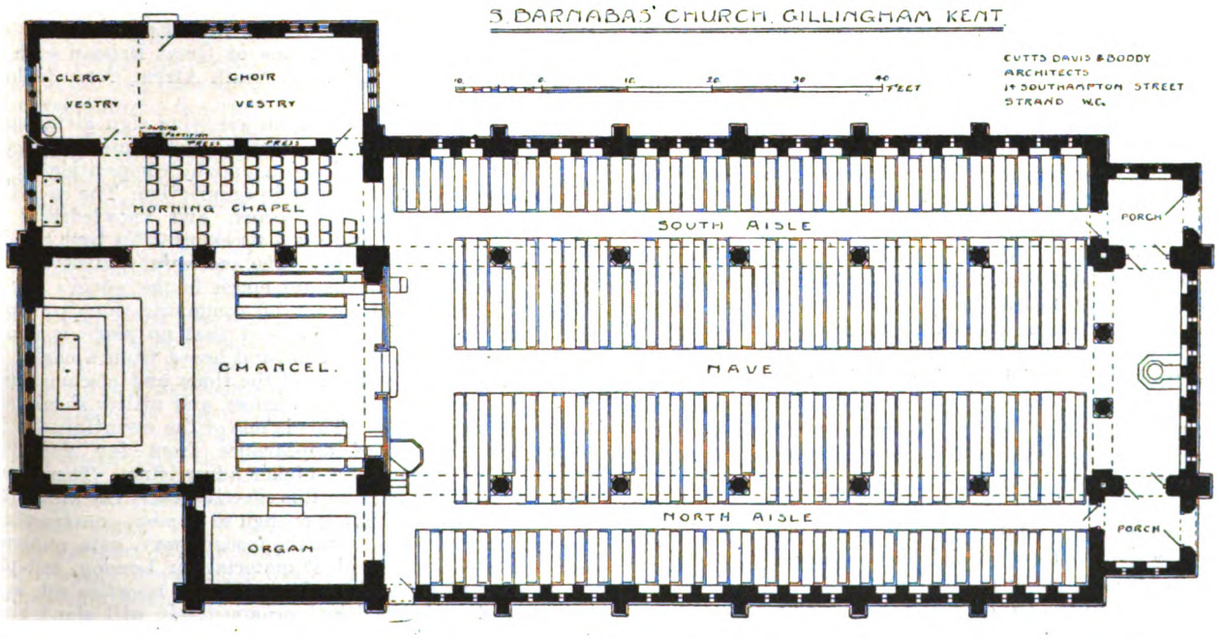
YESTERDAY saw the retirement from active official life of Mr. Andrew Young, who was appointed valuer to the London County Council in 1889. Since that time he has been responsible for the purchase of no less than 25,000,000*l.* worth of property on behalf of the community, and before then he was for eighteen years surveyor to the London School Board, on whose behalf he spent, in one branch of his work, 4,000,000*l.* on sites for schools, following the Education Act of 1870.

These are a few of the more important improvements in which Mr. Young has taken an important part in valuing the property to be purchased: The Kingsway-Aldwych improvement and the Clare Market housing scheme; the St. Luke's area; improvements and housing between Holborn and the Clerkenwell Road, east of Gray's Inn Road; the County Hall scheme, south of the river; the great Westminster improvement, from the Houses of Parliament to Lambeth Bridge, providing for the continuation of Parliament Gardens and the Embankment from the Terrace; the Boundary Street (Bethnal Green) housing scheme—the largest of its kind in London; the rebuilding of Vauxhall Bridge; the rebuilding of Putney Bridge; Blackwall Tunnel; Rotherhithe Tunnel; Greenwich Tunnel; Woolwich Tunnel.

The magnitude of these works, and the responsibility resting on the man who has to see that the community pays only a fair price for the property it is necessary to absorb, is shown by the fact that seven million pounds were spent on two of these schemes alone—those of Kingsway and Westminster.



The accuracy of his judgment is shown by the fact that whilst Kingsway has taken ten years to develop, due in part to an idea of other valuers and of capitalists that his figures were too high, there has been quite a scramble during the last two years for the few remaining plots. Of his urbanity and courtesy to those who had to meet him as opponents, whether acting for vendors or for purchasers, all those of our readers who so encountered him will testify, and also that whilst, as his duty required, he fought keenly, he always fought as a gentleman.



We do not understand the appeal made by the Rev. Charles G. Mackarness, Archdeacon of the East Riding and Vicar of St. Martin's, Scarborough, for charitable contributions towards the repair of the churches in Scarborough which were damaged in the recent raid. It has been stated in the daily Press that the Government would pay the cost of repairing damages caused by the enemy, and that we hold, and we are sure the majority of Englishmen hold, is the proper course. Scarborough's loss should be the nation's loss, and the nation is content to take up the burden rather than let it fall on the shoulders of those who happened to be the immediate sufferers.

The latest addition to the excellent publications recently issued from the Department of Textiles, Victoria and Albert Museum, is a Guide to the Bayeux Tapestry, prepared by Mr. F. F. L. Birrell. There are in the Museum two photographic copies of the embroidery, one, in Gallery 79, an enlargement to full size and hand-coloured, of the series of photographs taken by Mr. E. Tossetter in 1871, and the second another enlargement of them, mounted on rollers and kept in the Students' Room of the Department of Textiles for the convenience of those who wish to make detailed studies. These copies are a justification, if any is needed, for the official preparation of this Guide to the tapestry, now, after many vicissitudes, preserved in a room built for it in the library at Bayeux, which has been called "the noblest monument in the world relating to our old English history."

Some startling figures were quoted during a discussion by the Corporation of Glasgow of the proposed scheme of the Labour group for the erection of cottage dwellings on ground belonging to the Corporation. The proposal was moved by Bailie James Stewart as

Digitized by Google

follows:—"That a sum of £30,000 be set aside out of the revenue of the Common Good for the current year, to be lent, free of interest, to the Special Committee on Cottages for the Working Classes for the purpose of erecting cottages on unused ground belonging to the Corporation." He said that Glasgow, while it was the second city of the Empire, was the most crowded and the most densely populated according to its area of any of the big cities of Great Britain. In Glasgow they had a total of 218,000 occupied houses, of which 37,000 were one-roomed houses and 105,000 two-roomed houses —a total of 142,000 single and two-apartment houses, against 76,000 houses over that accommodation. That was to say, there were twice as many one-apartment and two-apartment houses as there were houses of superior accommodation. During the last few years a complete change had taken place with regard to the housing of the city. Some years ago, when it was proposed that

Digitized by Google

the Corporation should put its hands in the mortar tub, they were met by the outcry from the proprietors of property that the Corporation had no need to do it, because there were a great number of unoccupied houses in the city. Two years ago there were 22,000 unoccupied houses in the city. Last year there were 18,000 of these houses. This year the figure had fallen by 33 per cent. down to 13,000, and the bulk of these were houses under £10 rent. A year or two ago their Medical Officer made the startling statement that there were 10,000 houses occupied that were unfit for human habitation.

In a lecture on "The City and its Bridges," delivered by Mr. T. L. Watson, F.R.I.B.A., to the Glasgow Institute of Architects, the lecturer stated that at the close of the eighteenth century Glasgow, with a population of about 84,000, had four road bridges over the Clyde. To-day, with a population twelve times as large, there were no more, the result being "the perfectly appalling congestion of our streets," which continued to grow with accelerating force. The boundaries of the city had been enlarged, the tramway system had been extended in every direction, and there was now projected a great new boulevard in the direction of Loch Lomond, with the inevitable result of still further increasing congestion, until the question now was not whether another bridge was required but whether one bridge would suffice. Of course, the difficulty lay in the harbour, which was as vital to the prosperity of the city to-day as it had ever been. This difficulty had been looked upon as insuperable, but it could be shown that this was not so. The traffic to be provided for was of two kinds, the harbour traffic originating at or near the quays and docks, and the ordinary road traffic originating at a considerably higher level. These could be dealt with, each at its own level, by means of a road bridge having a clear headway of 75 feet above high water, and with a transporter bridge beneath it for the traffic at the quay level. By this means distances would be shortened, in many cases by about 1½ miles, heavy gradients would be avoided, and the shipping traffic of the harbour would continue as at present free from interruption.

WAR ITEMS.

In connection with the campaign undertaken by the Board of Trade on the advice of their Advisory Committee on Commercial Intelligence to assist British manufacturers and merchants to secure trade formerly in the hands of German or Austro-Hungarian firms, the Board have received a very large number of inquiries for the names of sellers or buyers of articles of which the sources of supply or markets have been interfered with by the war.

Special arrangements have been made in the Commercial Intelligence Branch of the Board of Trade for dealing with the inquiries, and lists are being prepared and circulated of articles which inquirers desire (*a*) to purchase and (*b*) to sell. The sixth list is now ready, and may be obtained by United Kingdom manufacturers and traders, together with copies of the previous lists, on application to the Branch.

British firms interested in any of the goods mentioned, either as buyers or sellers, should communicate with the Director of the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C.

Included in the list of "Articles which inquirers desire to purchase" are: Sheet-iron stove-pipe bends; composition flooring; imitation marble; artificial stone; presses for making bricks and concrete blocks; sand.

To Mr. William Strang, A.R.A., is due the credit of being the first to exhibit a series of paintings relating to the European war. On January 2 he will hold an exhibition at the Leicester Galleries, Leicester Square, of some twenty important pictures completed since the outbreak of war, together with some etchings of the stricken Flemish-towns.

That they are by so original an artist as Mr. Strang suggests that these war pictures will in no way resemble the paintings of battle artists to which we have for so long been accustomed, and there is little doubt that they will be open to a good deal of discussion.

It may be noted, by the way, that Mr. Strang has three sons at present serving in His Majesty's Forces.

Mr. Will Dyson, who has achieved considerable reputation by his remarkable cartoons which for the last two years have been a feature of *The Daily Herald*, has designed a number of satirical cartoons relating to the war, none of which have yet been published. They are to be exhibited on and after Saturday next at the Leicester Galleries, Leicester Square.

COMPETITION NEWS.

DUNFERMLINE.—In connection with experimental dwelling-houses for the working classes to be erected by the Carnegie Dunfermline Trust on a vacant site in Damside Street, the plans of Mr. Burnet N. H. Orphoot, architect, Edinburgh, have been accepted by the Trustees, who have also awarded premiums as follows: 1, Mr. Gavin Paterson, Hamilton (£15); 2, Mr. William Birrell, Dunfermline (£10); 3, Messrs. D. and J. R. M'Millan, Aberdeen (£5).

GLASGOW.—Mr. Kelloch Brown, of Glasgow, is the author of the selected design, "J," for the Glasgow Memorial to Thomas Carlyle. Fifteen designs were submitted by twelve competitors. The water-colour drawing shows a block of rough-hewn Scottish granite from 15 to 20 ft. high, surmounted by a bust of Carlyle. The estimated cost is £450, plus £50 extra for railings, &c.

ILLUSTRATIONS.

DOMINION HOUSE.

MR. A. RANDALL WELLS has supplied us with the following notes on his scheme for a Dominion House to be erected in Kingsway:—The objects of the scheme are to provide, firstly, a tangible and visible sign, in the heart of the Empire's capital, of the magnitude of the British Dominions beyond the seas and of their vast possibilities; and, secondly, to set up an instrument, or great clearing house, that will improve the organisation of the inter-Empire trade, and further strengthen the relations of Great Britain with the Dominions of Canada, United South Africa, New Zealand, and Newfoundland.

Dominion House is to be an arresting sign giving great publicity to the Dominions, and by their close conjunction inspiring them by combination and by competition to the highest efforts in efficiency and organisation. The co-ordination of all the interests, forces, and knowledge of the Dominions into one centre is a necessity. No time could be better for the undertaking. The successful journeys to the Poles symbolise an important epoch in the world's history. The establishment of means of communication, transport, and reproduction is so advanced that no place is remote. The world can almost be seen and heard from a chair. The house would be the outcome of the times and circumstances; its large simplicity, upstandingness, and utility should earn it instant recognition. This is one of the essentials—an immense effectiveness of appearance from far and near, avowedly an effort in the higher advertising. There would be no difficulty in gaining this effectiveness. On the positive side make the building big enough to be seen, construct it on lines of beauty suitably, in the modern way, with reinforced concrete, clad it in the best material for London, and plan it for convenience and comfort. On the negative side avoid all conventional detail and ornament—it will stand alone, without support from old-world architectural pedantic adaptiveness.

The imagination can hardly realise all those square miles of cultivation, the innumerable ones waiting cultivation, the Dominions' potentialities, their directness of purpose, their individual desire for power, and the fulness of living and desire to explore and exploit all the material world contains. That is where the Tower is a help. There will be no statuary, no symbolic groups; the poles of the wireless station at the top—the central station of the Empire—will be the finest symbol. The building should stand for reality and the present age.

Digitized by Google

The building consists of continuous blocks, 100 feet high, and parallel to the streets upon which they border. That in the Strand is 70 feet deep, and divided by a 40-foot wide throughway leading to Kingsway; that to Melbourne Place is 60 feet deep; that to Aldwych 60 feet deep, and divided by the 40-foot way from the Strand; that towards Marconi House averages 100 feet deep; 70 feet are taken up by a theatre—from the centre rises a square tower 400 feet high, the 40-foot way from the Strand to the Kingsway passing through it, and with a 40-foot way upon the left and right leading to the internal courts. These are roofed with glass. The building is planned to give magnificent show and exhibition spaces and comfortable well-lit offices.

The windows have been made as numerous as possible, and in every case come within 12 inches of the floor; London is so often dark. Wall spaces have been avoided, as they could not be made big enough to be architecturally effective without sacrificing light in the rooms.

Bay windows have been used as much as possible to add to the pleasantness of the rooms, and architecturally to give strong vertical lines to the building and to emphasise the curved frontages to the Strand and Aldwych. The same idea is followed in the tower, which is divided up into strong vertical lines; it would be a vivid uprising mass of glittering glass and luminous white stone.

The great arch in the middle of the Strand front leading through to Kingsway will be the main approach to the exhibition courts, and to the residences and hotel with their respective entrances.

In the east block a grand entrance with staircase and lifts to the floors above for Canada; the west block to serve the same purpose for United South Africa.

To the west of the central entrance New Zealand is placed, and to the east Newfoundland.

The great arch is 72 feet high, and forms a cross-vaulting with the entrances to the exhibition halls; this would be lighted at night with an enormous Mercury vapour light, throwing the light up into the vault.

HOTEL DE VILLE, BRUSSELS.

THE Hôtel de Ville of Brussels, with its picturesque accessories as Samuel Prout saw it, forms the subject of our reproduction to-day from "Continental Sketches." In view of the threatened destruction when the Germans leave Brussels, the plate will be of interest, even though we may hope that this threat is but one more piece of Prussian bluff.

AT a recent Local Government Board inquiry at Huddersfield, at which the Corporation sought new powers with regard to the conversion to the water-carriage system, it was stated that the cost of the conversion would be £140,988, but the saving in scavenging would be £7,818 a year.

MR. STOCKDALE HARRISON, Senr., F.R.I.B.A., of St. Martin's East, Leicester, architect and surveyor, whose death took place on November 10, left £22,509. An account of Mr. Harrison's career appeared in our issue of November 13.

MR. DAVID BALFOUR, M.I.C.E., F.G.S., of Myre Hall, Houghton-le-Spring, died last week in his seventy-seventh year. He carried on the profession of a civil engineer in Newcastle, being the senior partner of the firm of Messrs. D. Balfour & Son, whose work has been carried on for a number of years by his son, David Balfour, jun., M.Inst.C.E. He served his pupilage with Mr. John Fulton, C.E., late city engineer of Dundee and Newcastle, and went to England fifty-one years ago, when he was appointed engineer to the Sunderland and Houghton-le-Spring Highway Board. He carried out a large number of engineering works in England and Scotland, including bridges, sewerage, and sewage disposal works, water supplies, tramways, railways, shipping staithes, shipbuilding yards, &c. He gave evidence before many Royal Commissions, and contributed a number of papers to scientific societies.

THE Estates Committee of the York Corporation have had under further consideration the question of the design of the proposed new Cap of Maintenance which the King has promised to present to the City, and they have adopted a design prepared by the York School of Arts and Crafts. The design is, as far as can be ascertained, of the fourteenth-century period, when the first cap was presented to the city. The cap is of crimson velvet, trimmed with ermine, and with the sides turned up. Instructions have been given for the drawing to be forwarded to the King for approval, with a request that the cap may be ordered from Messrs. R. W. Anderson & Sons, York.

THE TOWER OF LONDON.*

By H. FRANKLYN MURRELL, A.R.I.B.A.

THE screw may twist and the rack may turn,
And men may bleed and men may burn.
On London town and all its hoard
I keep my solemn watch and ward.

Sir William Gilbert.

I am not concerned this evening so much to give an exact chronological history of the Tower or to trace with archæological precision the exact date of each wall and tower, but I am anxious that we should all catch the spirit of the Tower and realise its significance in our national story, and for this we shall need a measure of the historical sense, and, above and beyond all, a lively imagination. It must be confessed that by some unhappy chance everything conspires to prevent us realising the real Tower atmosphere. To many of us the first thought suggested by the Tower is that of stale buns and of flashing jewels, with a general background of horse-armour. In the words of the inimitable Dan Leno, "It's a nice old place to spend a happy day." It seems the almost universal custom of all accounts of the Tower to divide the subject up as "The Tower as a palace," "The Tower as a prison," &c. I do not propose to weary you in this particular way. It is true that the Tower has been a Royal palace, a treasure-house and mint, a fortress and arsenal, and all these things at one and the same time, but its supreme historical significance is in its character of State prison, the English Bastille.

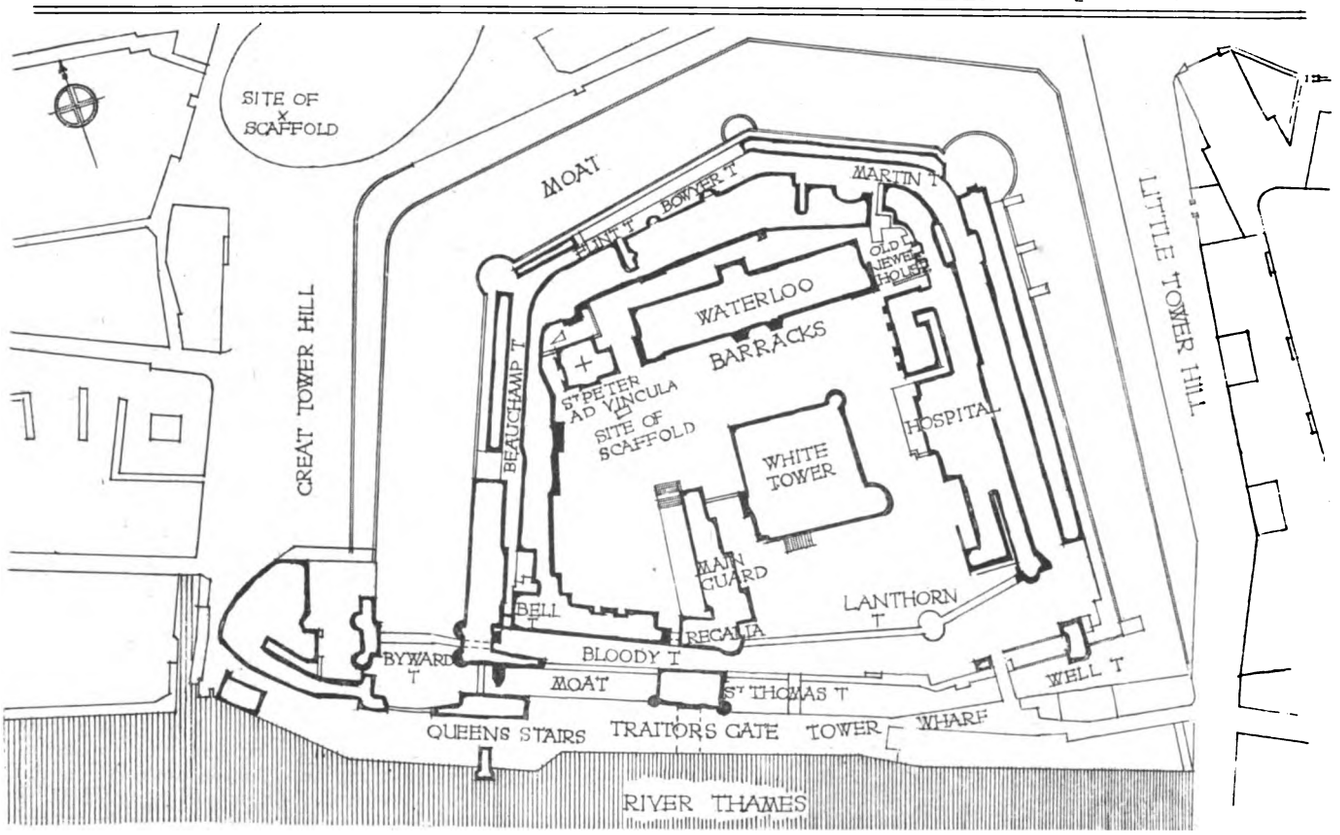
Characteristically the impulsive French pull down their Bastille, the phlegmatic English turn theirs into a harmless old museum whose familiarity breeds contempt in the minds of children accompanied by maiden aunts. It is unquestionably a tower of tragedy: its comedy is only a grim humour. A cruel and bloodthirsty old ruffian, he has spared none; he has had a special thirst for blue blood, the young, the fair, the faithful alike he has caged, racked, headed. First a word as to the Tower site. At the extreme east of the early portion of the City, the site doubtless had considerable stragetic value owing to the steep slope of what we now know as Tower Hill. There is no doubt that the Roman London wall, just as the City ditch of the Middle Ages, terminated at this point. The remaining portion of wall to the east of the White Tower was the bastion at the south-east angle of the Roman wall.

This fort, the key to London approached from the sea, doubtless was the object of attack by marauding Danish pirates. The Conqueror—no mere strategist—was quick to appreciate the military significance of the site so apparent to the Romans. He planted here the great fortress which was to dominate the City of London for so many centuries, but from his time onward the function of the Tower has been that of guarding the King from the City rather than that of guarding the City from any external danger.

THE PLAN OF THE TOWER.

The conglomeration of buildings forming the present Tower are at first site difficult to reduce to a systematic plan. The historic portions, however, can be grouped as follows:

The Keep, or White Tower, protected by an inner line of walls with bastions at all angles and intermediately thirteen in all, with a narrow street between this and the outer wall, which abuts immediately on the moat and has three bastions on its north side and six towers on the river front.



On this side the street widens out, with Traitors' Gate in the centre, forming the approach from the river itself. Apart from this, the only approach was by the bridge across the moat at the south-west corner, guarded at its inner end by the Byward Tower and at its outer end by the Middle Tower. From the true and exact draught of the Tower Liberties surveyd in the year 1597 by Juliemus Haiward and T. Gascoyne it is evident that beyond the Middle Tower was the Lyons Tower, a kind of semi-circular platform round which the moat made a detour, crossed by the Lyons Gate, so that it was necessary to cross the moat at least twice to gain access to the outer ward from the City.

It might appear to a casual observer that the completion of the moat on the river side is an unnecessary precaution,

---

* Read at a meeting of the Upper Norwood Athenæum.

Digitized by Google

but from the prison aspect it was undoubtedly an advantage to have the captive cut off from friendly aid in this direction. With regard to the other buildings, they are just those of a complete prison, chapel, Governor's House, and Guard House. An item of the plan definitely suggesting the palace must have been the Royal menagerie standing on the site of the present ticket office, which seems to have existed from Norman times till removed to Regents Park in 1834.

And now to turn to the most important aspect of the Tower—namely, its unique history.

The Norman Tower.

The White Tower, as we know it, is truly Norman. In its essential plan and massive construction it is a typical Norman fortress. As we have pointed out, in common with most of the Conqueror's building, its purpose was to dominate the newly conquered country.

It is tolerably certain that the White Tower as we know it was the work of Gundulph, a monk of Bec, in Normandy, afterwards Bishop of Rochester. Doubt has sometimes been thrown upon this by the discovery in 1720 and 1777 of remains of very massive walls near the White Tower. It is difficult to know to whom to attribute these if not to Gundulph.

We may picture, then, the energetic Bishop of Rochester not merely occupied with the great works at Rochester Cathedral itself but aiding his strong master in rearing the castle which was to be the final refuge of the kings of England from their turbulent subjects for some centuries. Do we realise what a mighty structure this great keep is, a great stone cliff? An oblong 116 feet from north to south, 96 feet from east to west, and 92 feet high—that is, higher than an ordinary modern building may rise under the London Building Act. Walls 15 feet thick, a large newel stair in the north-east corner, with minor stairs at the north-west and south-east angles give access only up to the first floor. An inner wall 7 feet thick running north and south divides the building for its whole height. There was apparently a large archway on the North side originally.

Architecturally the White Tower is effective because of its mighty scale, relieved by its four picturesque little turrets. In common with all our City monuments it was, of course, doctored by Sir Christopher, who in this case with but slight effort converted windows from Norman to Renaissance. But fortunately no restoring hand has been laid on the Chapel of St. John, unquestionably the finest chapel remaining in any Norman castle. It is Norman at its best, massive to a degree, yet possessing in its severity an atmosphere and reverence essentially desirable in a church building.

In this chapel was enacted the first scene in the greatest of Tower tragedies, the murder of the Princes.

Sir Robert Brackenbury was kneeling here when Richard's messengers came post-haste demanding the death of the Princes, a demand to be met with a refusal.

Here we must picture Henry I.'s dead Queen lying in state, and Mary attending Mass in thanksgiving for the suppression of revolt. And here the night before the coronation of each king aspirants to the order of knighthood would watch their arms in silent vigil.

To pass on to the rooms adjoining the chapel now used as armouries.

Here many famous prisoners have been kept—Baliol, King David of Scotland, King John of France, and that interesting captive Charles Duke of Orleans. The coloured picture by the latter now preserved with a volume of his poems in the British Museum is indeed one of the most valuable records we possess of the appearance of the Tower in the Middle Ages. With true artistic licence, and to show interior and exterior at the same time, the artist has opened a great arch in the middle of White Tower, and shows the Duke at work within. The ubiquitous poet is seen also at the window sonneting, also in the courtyard receiving a loyal arrival from France.

On the upper floor was the ancient Council Chamber, the scene of many great happenings, undoubtedly the most dramatic was that which involved the death of Hastings. Here we see Richard III. breaking in upon his Lords in Council with the exclamation, "What are they worthy to have that compass and imagine my destruction?" to which Lord Chamberlain Hastings answers, "If any have so heinously done they are worthy of heinous punishment." Ultimately the furious King orders his arrest—"I will not to dinner till I see thy head off." Hastings is hurried down the stair of the north-east turret. As the story goes, owing to building operations the path to Tower Green is obstructed, so, to please the hungry king, who is watching from a window of the Council Chamber, Hastings is compelled to lay his head on a convenient timber. It is to be hoped that the king enjoyed his lunch. The keep was furnished completely for a siege with kitchen, well, &c., but most of the accommodation in the lower part was for prisoners. It is difficult to realise the terrible scenes which these innocent looking cells have witnessed.

We must picture these cells crowded with Jews accused of "clipping" the coin of the realm in the days of Edward I. In the dungeon forming the crypt of St. John's Chapel the prisoners taken in Wyatt's rebellion were kept.

Digitized by Google

Some of the larger dungeons entered from the stair on the north side were used as torture chambers. We know for certain that Guy Fawkes was tortured on the rack and kept in Little Ease between his sufferings, but perhaps it is better not to pursue the horrors of the White Tower further.

ST. PETER AD VINCULA.

This building is architecturally uninspiring, but externally at any rate it has a peaceful look suitable to its historic part, "porte after stormie seas." And here all the noble dead from the scaffold on Tower Green, almost at its door, have been found. The account of the finds at the restoration of 1876 are most valuable. Fear of incurring Royal displeasure probably accounts for the careless and rather shallow interment of many of the victims. Of the bones of Anne Boleyn Mr. Hoyne Bell says: "The forehead and lower jaw were small and especially well formed. The vertebræ were particularly small, especially one joint, which was that next the skull, and they bore witness to the Queen's lyttel neck."

TOWER GREEN.

Tower Green was originally divided into garden, parade ground, and burial ground.

The paved and railed plot marks the site of the scaffold within the Tower. This seems to have been reserved for Royal sufferers or those who were likely to arouse too much public sympathy. The first victim to suffer here was Anne Boleyn in 1538.

She seems to have been beheaded with a sword by the hangman of Calais, and her body thrown into an arrow-chest of elm.

Lady Jane Grey suffered here in 1553. It is unquestionably the most pathetic of Tower stories. Her husband was beheaded first. As the record has it: "His carcase thrown into a cart and his head in a cloth he was brought into the Chappele within the tower when the Lady Jane whose lodging was in Master Partridges house dyd see his ded carcase taken out of the cart as well as she dyd see hym before alyve going to deathe, a sight to hir no less than deathe."

There do not seem to be many records of the last moments of Queen Katherine Howard, but one testifies that the Queen and Lady Rochford "made the moost godly and chrystian end that ever was heard tell of I thynke sins the world's creation."

Beauchamp Tower.—The records—made mostly by prisoners of Tudor times—on the walls of the large upper prison chamber deserve a paper to themselves. It is impossible to deal with them here.

The upper chamber must have been a comparatively comfortable prison, not without some architectural pretensions, and the inscriptions, Catholic and Protestant alike, show a fine spirit of courage and faith.

Devereux Tower—named after Robert Devereux, who was imprisoned in this tower in the reign of Elizabeth—has an interesting vaulted kitchen.

Flint, Bowyer, and Brick Towers are the towers of the inner wall on the north side working from west to east. The first of these was built in 1796 on the site of an early tower known as Little Hell.

The Bowyer Tower, so named from a bowmaker who had his workshop here; the lower part is of Edward III.'s date, but the upper more recent.

Brick Tower.—Chiefly interesting on account of its association with Raleigh.

Martin Tower, at the north-west corner of the inner wall, is interesting as having been the ancient Jewel House, the scene of Col. Blood's famous attempt on the Regalia. Here the seven bishops were crowded together—a late scene in Tower history, it is true, but quite worth recalling. Leaving Westminster amidst the shouts of the people, "God bless the Bishops," they arrive at the Tower, and, walking up the steps at Traitors' Gate, men and officers ask their blessing on their knees. At Evensong in St. Peter at Vinculas the Lesson for the day is "In all things approving ourselves as the ministers of God in much patience, in afflictions, in necessities, in distresses, in strife, in imprisonment." It is not necessary to recall the scenes of popular delight on their release.

The Constable, Broad Arrow, and Salt Towers are on the eastern side of Inner Ward; they are not specially remarkable for historic happenings.

Towers of the South Side, Wakefield.—So called from Yorkist prisoners having been placed here after the battle of that name. The lower portion is of Norman date. The upper portion, now used for the display of the Crown Jewels, is of Henry III. time. It is of octagonal plan, with a recess on the south-east side, used in ancient times as an oratory. Beneath the Jewel House is a terrible dungeon, where Highlanders were herded together after Culloden.

Bloody Tower.—It is most unfortunate that we were unable to see the interior of this, perhaps the most historic spot in the whole Tower—haunted by ghosts, they say, and no wonder. First, then, come the ghosts of the Princes.

> "O thus," quoth Dighton, "lay the gentle babes:"
> "Thus, thus," quoth Forest, "girdling one another."
> When Dighton thus quoth on: "We smothered
> The most replenished sweet work of nature
> That from the prime creation e'er she framed."

So Shakespeare's version of the tragedy. It was not till the time of Charles II. that the skeletons were found beneath the steps of the White Tower. Not less of a tragedy, perhaps, was the imprisonment of Raleigh here from 1604-1616. It must have been a terribly cramped life for the great adventurer writing his "History of the World" in this Tower, in spite of his chemical experiments and walks in the Constable's Garden. But walking in ghostly company with Raleigh we must see his friend, Sir Thomas Overbury. Imprisoned, poor man, for condemning the marriage between Somerset and Lady Frances Howard. The latter, to revenge herself, arranged for his slow poisoning, but, this proving tedious, he was smothered after the manner of the Princes.

Felton and Laud may haunt this tower, but perhaps the most interesting figure is that of Judge Jefferies. We can picture the old man having been "taken" in an ale-house at Wapping, cheering the spirits and his own, "imbibing strong drink," and dying ultimately of delirium tremens.

Traitors' Gate.—Unquestionably this is the show spot of the Tower. The great arch, 62 feet span, carrying St. Thomas Tower, the ancient oak gates, and the historic steps only require brown Thames water lapping them to complete the picture. I cannot imagine anyone possessed of the historic sense failing to be stirred by the associations of this tragic stairway. Queens Anne Boleyn and Katherine Howard, in turn having last their Royal master's favour, came through Traitors' Gate on their way to Tower Green. Most pitiful story of all, the nine-day Queen, Lady Jane Grey, passed this way. And it must have been with no small foreboding that Princess Elizabeth, consigned to the Tower by Queen Mary, landed at Traitors' Gate on Palm Sunday. How should she know that in a few years she would leave the Tower on her way to her Coronation at Westminster? Time fails us to tell of Cromwell Earl of Essex, Seymour Duke of Somerset, Devereux Earl of Essex, the Duke of Monmouth, and the Bishops, but this spot has seen them all.

St. Thomas Tower, named after St. Thomas of Canterbury, appears to have at one time contained a chapel; it is now the residence of the Keeper of the Crown Jewels.

Byward Tower.—Supposed to have been so named from the by-word, or password, having been given here. On the riverside a postern gate gave access by a drawbridge to the royal landing-place on the wharf.

The Wharf.—This was constructed by Henry III., who did so much tower building. Thames-side building has always been risky, as many a builder knows to his cost. When Henry's river wall was swept away by a high tide the citizens rejoiced, and, with the fine imagination of mediæval times, said that St. Thomas à Becket had knocked it down with his crucifix; but on each disaster practical Henry only said, "Build it stronger," and, in spite of further battering by St. Thomas, we have Henry's Wharf to this day.

The Moat seems to have been the work of Edward I., and to have been the last important addition to the Tower defences. The draining of the moat in 1843 was doubtless a hygienic gain, but the Tower must have been robbed of a great deal of its picturesqueness and impressiveness in consequence. Contrast in imagination the effect of the mighty walls and bastions reflected in the slimy green water with the smugness of the present gravelled parade ground, redolent of orange peel. The moat was naturally the chief obstacle to the escape of many a leaguered prisoner. Across the north side of it Lord Macquire and Colonel MacMahon essayed escape, having lowered them-

Digitized by Google

selves by a rope conveyed to them in a loaf of bread. Unfortunately, after swimming across, they were discovered by a sentry. Better fortune attended Lord Capel, who attempted to wade across, though he seems to have been on the point of calling out for aid, his feet being weighted down with mud, when he was cheered to continue by finding friends awaiting him on the further bank.

Tower Environs.—Just a word with regard to these. On Great Tower Hill was the site of the permanent scaffold. The normal course seems to have been for the sheriffs to proceed to the Tower and demand the bodies of the condemned, then to proceed to the public execution on Tower Hill. It is interesting that in the later executions, as Lords Lovat and Kilmarnock, every detail seems to have been arranged to lessen the brutal horror of the operation. Thus red baize was arranged to receive the heads, and the bodies were immediately put into coffins. This is, perhaps, the most suitable text on which to close this somewhat lengthy, and certainly tragic, story.

The history of the Tower is the history of the English people. It is a story of a millennium of development, steady, slow, sure. Tower records are the dark pages of history, but as we turn them over century by century they grow lighter. A lessening of despotic power, the growth of religious toleration, a larger measure of justice for all: these are writ large on every page, and they have been won in no small measure by the sufferings of Tower prisoners. The rack, the screw, the scavenger's daughter are gone for ever, but it is well that we treasure this grim old monument, and learn from it a profound gratitude for the softer times in which we live, and a mighty admiration for the fine courage and faith of some of those old sufferers.

TESTING PIGMENTS FOR PERMANENCE OF COLOUR.*

By SIR WILLIAM DE W. ABNEY, K.C.B., D.C.L., D.Sc., F.R.S.

IT is some twenty-eight years since the late Dr. W. J. Russell, F.R.S., and myself were asked by the chiefs of the Science and Art Department to investigate the causes of the fading of water-colour drawings when exposed to light. There were, and are, in the Victoria and Albert Museum collection of water-colours many samples of the injurious effects which exposure to light have had on them.

Soon after we started our investigations the Press announced that such an inquiry was under way, and a resolution from the Royal Society of Painters in Water Colours was then sent to the Science and Art Department, urging "the desirability, in the interests of water-colour painters, of the appointment of a water-colour painter in association with Dr. Russell and Captain Abney in the work of investigating the effect of light of various colours upon water-colour pigments." This resolution was considered, and the Department requested the Royal Water Colour Society and the Royal Institute of Painters each to appoint two members to a committee which it proposed to form with a view that we should keep such a committee informed as to the methods of investigation we were adopting. "The committee, with this information before them, would be in a position to judge whether there were any further points they would desire to suggest for investigation, or whether there is any investigation which the committee would themselves wish to carry out."

The committee appointed was as follows: Sir F. Leighton, P.R.A. (chairman), Mr. L. Alma Tadema, R.A., Mr. T. Armstrong, Mr. Sidney Colvin, Mr. Frank Dillon, Mr. Carl Haag, Sir James D. Linton, Mr. E. J. Poynter, R.A., and Mr. Henry Wallis, with Mr. Arthur Torrens as secretary. The scheme that we had thought out was submitted to the committee and unanimously approved, and they did not propose any investigation of their own. For nearly three years we continued our experiments, and in June 1888 we made a report of which the above-named committee also approved. This was issued as a Parliamentary Paper to both Houses of Parliament. A certain number of reviews and various letters appeared in the Press on the subject of the report. The criticisms were mostly of a kindly nature. The facts brought out by the results of our numerous and tolerably exhaustive experiments were not questioned. In one or two cases our interpretation of them was criticised. After a month or two our investigation did not call forth much further notice, and, like the fate of most Parliamentary reports, it remained to a great extent unheeded, except, perhaps, by artist colourmen. Another unofficial committee was formed by some persons interested in the subject of Fading, and the results of their experiments were published from time to time. If I remember rightly, they in no way inpugned the results of our experiments.

There are so many colours in an artist colourman's list that the trial as to the stability of all of them would have increased the number of experiments manyfold. To enable us to judge which were the most necessary to proceed with, the Science and Art Department obtained from forty-five of the principal water-colour artists lists of the colours which they individually employed. From these lists we selected the pigment colours the stability to light of which we concluded ought to be investigated.

Twenty-five years have passed, and I shall not be guilty of indiscretion if I say that we found that nearly all the forty-five were using one or more of what may be called fugitive colours. It would have been interesting if a year after our report had been issued we could have had fresh lists before us of the pigments they then severally used, to see what changes had been made. Some, no doubt, would have thought as one artist did, who argued that whilst some of A.'s colours had been proved to fade, yet all of B.'s were quite safe. Almost a new generation of artists is living now, and, as artists are not as a rule given to reading scientific works, it is quite possible that the report on the fading of water-colours may be unknown to them, especially as it is "buried" as a Parliamentary Paper. It is for this reason that I wish, in a way, to revive if possible the interest in the subject by bringing it before the Royal Society of Arts, and to explain a method of testing any pigment for fading in a short time, instead of having to wait for a year or two before results could be obtained. There are various new water-colour pigments placed before the public from time to time, and it is these which require a simple test.

In reference to the younger generation of water-colour artists, I may say that even older painters sometimes require information.

It was not very long ago that on arrival at a certain foreign capital I paid a visit to an artist friend whose drawings are well known and appreciated in Europe and America. On my arrival I was shown up to the studio and found my friend for the moment the picture of despair. He was extracting pictures from a packing-case which had been returned from another capital after being exhibited for a couple of months the previous autumn.

He pointed out to me that a whole series of those which had been hung near the skylight of the exhibition room had lost colour in parts. Their freshness had gone, though they were still beautiful works of art. Questioning him as to what colour had faded, I found that it was vandyke brown, which he used to give tone to some of his delicate colour-washes. He only knew me as an amateur painter, and was unaware that the question of the fading of colours had been one of my hobbies. I told him the result of our experiments, and furnished him with a copy of our report. On a subsequent visit I found him radiant once more, having obtained a substitute for his vandyke brown which was permanent. I may say that he grieved principally over the fact that his clients had pictures of his which might behave or have behaved as those did which were exhibited.

My friend being a foreigner, I could not blame him for being unacquainted with our experiments on safe colours. Nearer home I have found published a list of colours used by a very celebrated artist. That list contains the names of some which he should have placed on the "black list." One has to imagine what may be said of his pictures by his clients in a few years to come. I have often inquired of my numerous artist acquaintances as to the composition of the palette they use, and in not a few cases have I given warning as to colours which ought not to be used.

I trust I may be allowed to recapitulate briefly the conditions most favourable for the fading of pigments, and those under which the fading of some of them is highly, to say the least, improbable to occur.

Speaking generally, every pigment absorbs or abstracts rays of the spectrum which it does not reflect, and it is the collection of the reflected coloured rays that gives the colour of the pigment. Each particle of a pigment is composed of a very large number of molecules, and these molecules are formed of several atoms, held together by attraction to one another. The rays of light absorbed by the pigment may, by their vibratory motion, shake away from the molecules

* A Paper read before the Royal Society of Arts.

Digitized by Google

one or more of the atoms, decomposing the molecules, and thus change the particles of the pigment. This change in composition is shown as fading. Like the silver salts in photography if a body is in contact with the pigment, which can take up the atoms of the shaken-off molecules greedily, then the fading in a given time will become more rapid. Such a body is found in the moisture in the air, so that a damp pigment fades more readily than a dry pigment. In the case where the atoms of the pigment, even with moisture present, refuse to be removed from the molecule, there is no fading.

It was owing to observations on the salts of silver, which behaved as just described, that our experiments on pigments were started. There is always moisture in the atmosphere, so that if a pigment is exposed to light under ordinary atmospheric conditions it is liable to fade; if it will fade at all the fading will show itself eventually. In our experiments the light employed was sunlight and skylight. The pigments exposed had various depths of colour, No. 1 being the lightest and No. 8 the darkest. Half of the paper washed with the varying shades of colour was covered up with black paper, and the light had free access to the other half. The papers were exposed in glass tubes bent over at one end to form a hook. There was a perpetual change of air in the tubes.

The annexed table shows the pigments which were exposed to light in these tubes, and the results of the exposure. The last thirteen showed no signs of fading. The first thirteen are really unstable, and the whole list is placed approximately in the order of instability. The next thirteen are much less unstable:—

Colour	Composition according to Winsor and Newton.
Carmine	Lake prepared from cochineal.
Crimson lake	Lake prepared from cochineal.
Purple madder	Lake prepared from madder root.
*Scarlet lake	Lake prepared from vermilion and crimson lake.
†Payne's grey	Indigo crimson-lake and carbon black.
Naples yellow	Mixture of zinc white and cadmium yellow.
Olive green	Quercitron lake, bone brown, and ultramarine.
Indigo	Extract from the indigo plant.
Brown madder	Lake prepared from madder root.
Gamboge	A preparation of gum resin.
Vandyke brown	Native earth prepared for painting.
Brown pink	Lake made from quercitron bark.
Indian yellow	Prepared "purree" from India.
Cadmium yellow	Sulphide of cadmium.
Leitch's blue	Mixture of Prussian blue and cobalt.
Violet carmine	Lake obtained from root of anchusa.
Purple carmine	Lake obtained from root of tinctoria.
Sepia	From the cuttlefish bags.
Aureolin	Double nitrate of cobalt and potassium.
Rose madder	A lake from the madder root.
Permanent blue	A pale variety of French ultramarine.
Antwerp blue	Prussian blue and alumina.
Madder lake	Same as rose madder.
Vermilion	Mercuric sulphide.
Emerald green	Aceto-arsenate of copper.
Burnt umber	Calcined raw umber.
Yellow ochre	Native earth.
Indian red	A variety of iron oxide.
Venetian red	Artificially prepared sesqui-oxide of iron.
Burnt sienna	Calcined raw sienna.
Chrome yellow	Normal chromate of lead.
Lemon yellow	Chromate of barium.
Raw sienna	Native earth.
Terra verte	Native earth.
Chromium oxide	Chromium sesquioxide.
Prussian blue	Ferro-cyanide of iron.
Cobalt	Alumina tinctured with cobalt oxide.
French blue	Artificial ultramarine.
Ultramarine ash	Extract of lapus lazuli.

Looking at the composition of the last thirteen permanent colours, we cannot fail to notice that they are all native earths or oxides of metals, with one or two exceptions. In fact, all have a mineral basis, whilst the remainder of the list, which have the most tendency to fade, are mostly organic derivatives.

It must be recollected that the light used in obtaining these results was of the most intense nature, and not that to which ordinarily water-colour paintings would be exposed.

The second thirteen colours are probably colours which would not fade in any ordinary light. It must, however, be remarked that when mixtures of colours are employed those colours which are more or less fugitive have a greater tendency to fade than when tested alone. For instance, in a mixture of indigo and Indian red the indigo fades more easily than the indigo does when unmixed. Russell and myself proved this by experimenting with thirty-four mixtures, such as were often used by artists.

The case which I mentioned of the rapid fading of vandyke brown in the light from the sky was probably due to the vandyke brown being used mixed with other colours.

It may be as well to state here we found experimentally that practically every coloured pigment exposed to light *in vacuo* declines to fade, and the same may also be said of pigments exposed in perfectly dry air or oxygen, a condition which is non-existent in the atmosphere in which pictures are exposed to light. The presence of moisture is always required to effect a change in colour, and we also found that the bluer the light to which colours are exposed the more rapidly, in most cases, will the fading take place.

A reference must here be made to the effect of the light from the sky on pigments exposed for nearly two years in a frame in a window with north light. The following colours were in the frame:—

Antwerp blue	Rose madder
Prussian ,,	Carmine
Leitch's ,,	Prussian blue and burnt sienna
Indigo	Prussian blue and vandyke brown
Gamboge	Prussian blue and gamboge
Brown pink	Prussian blue and Indian red
Indian yellow	Indigo and vandyke brown
Naples ,,	Indigo and burnt sienna
Lemon ,,	Indigo and Indian red
Vandyke brown	Rose madder and raw sienna.
Venetian red	Antwerp blue and raw sienna
Crimson lake	Vermilion and chrome yellow
Vermilion	

Our report on the effects of this moderate daylight was as follows:—

Of the single colours, gamboge, indigo, and Naples yellow had slightly faded; brown pink had faded perceptibly to six (the deepest shade but two); carmine had bleached to three; vandyke brown had faded to one and was fainter to four; and crimson lake had faded to five; and all the darker shades had become paler. In mixtures one of Prussian blue and burnt sienna that had changed, the blue had faded. With Prussian blue and vandyke brown, and with indigo and vandyke brown, the vandyke brown had faded. With Prussian blue and gamboge, the gamboge had slightly gone in No. 1, and all shades had become browner. With indigo and gamboge, all the shades had become paler throughout. With indigo and Indian red the indigo in No. 1 had gone entirely, and partly in all tints. The other colours, both single and mixed, had not changed.

This experiment confirms the results which had taken place in strong light. We may, therefore, take it that the list of fugitive and stable colours we have given is the same in feebler light as it was in sunlight. From the permanent thirteen colours we have given, and from the thirteen semi-fugitive colours, we can form a good gamut for the water-colour artist.

Various artifices from time to time have been proposed for preventing the fading of pictures in light. A novel and effective one theoretically was to make the frame into a vacuum chamber. But so far as I know there were practical difficulties existing which prevented its general adoption. Recently a glass has been proposed which is said to prevent chemically the active rays from reaching the picture. I have roughly and not exhaustively tried a specimen of this glass, and exposed fugitive pigments beneath it to light this autumn. I have not found that it prevented the fading of the colours I tried, and I should hesitate to adopt it myself. But I hope that others will try its effect. If it is proved efficient it would be a great boon, and the list of fugitive colours might then be of no use. I have said that the blue light (which includes the violet) is that which is

* Scarlet lake more recently prepared is now made from vermilion and alizurin crimson.

† Payne's grey is now made from carbon black ochre and French ultramarine. Both Payne's grey and scarlet lake should now be much more permanent.

Digitized by Google

most chemically active. I found that if a skylight was glazed with signal-green glass and an orange in right proportions to make a white light by their mixture, the colours of pigments appeared as in ordinary white light and the chemically active rays were cut off. The committee I mentioned in my paper satisfied themselves that such was the case, and the Raphael cartoon gallery was so glazed. The public seemed unaware of the peculiar mode of glazing.

May I be allowed to become a little personal for the moment? Having studied the theory of colours from a scientific point of view for more years than I like to remember, when I retired from the Civil Service some eleven years ago I took to painting in water-colours as an occupation. Naturally I endeavoured to get a gamut of colours which should be sufficient in their range and at the same time as permanent as possible. My colour-box now consists of:—

Vermilion	Cobalt
Light red	French blue
Rose madder.	Antwerp blue
———	Cyanin blue
Aureolin	Violet cobalt
Yellow ochre	———
Raw sienna	
Cadmium yellow	(An imitation and permanent)
Madder ,,	vandyke brown
Lemon ,,	(An imitation and quasi-
———	permanent) brown madder
Emerald green	Turner's brown
Viridian	Burnt sienna
Hooker's green	Neutral tint (from my own
(A new mixture)	formula)
Sunny green	Ivory black

All these colours are either in the list of the thirteen permanent colours, or come near them in the next thirteen. None of the colours is in the first thirteen, which, as already said, I class as fugitive colours.

Before adopting these colours I was anxious to see how the mixtures imitating colours with known names would stand the light. A year or two after the report had been published I determined to try if a short cut could not be found to test the permanency of any colour. Some experiments I had made with certain photographically produced colours led me to think that the action of light on pigments in the presence of moisture might be a secondary action, and that the fading might be due to the formation of some oxidising agent produced by the light on moisture in the presence of oxygen. It had been proved in our report that the exclusion of all air from the colour prevented fading, and that colours did not fade when *dry* oxygen was in contact with them, and that only when there was the addition of moisture did the fugitive colours fade. It appeared to me that if oxygen were ozonised in the presence of moisture, the action might be the same as when light was acting with no added ozone present: in other words, that light itself tended to produce an ozonised atmosphere in the presence of moisture, and that it was this which caused the fading.

To test this, strips of the same colours as those which were exposed to the light were moistened and placed in a tube, through which ozonised oxygen was passed in a slow current. The oxygen was ozonised by an ozone tube connected with a coil. As I anticipated, there was a fading of those colours which were affected by light. I have already given the list of single colours which were tried, in their order of "light" stability. Practically this same list is here repeated in the following table, but it also shows the times of exposure to the ozone current which were required to cause fading or destruction of those colours which light had been able to alter. The times given as necessary for ozone to act are approximately the relative sensitiveness to fading by the method described.

Pigments in the Order of Fadings by Light.	Time of Exposure to Fade in Damp Ozonised Air. h. m.
Carmine	0 10
Crimson lake	0 30
Purple madder	0 20
Payne's grey	1 0
Naples yellow	0 45
Olive green	1 5
Indigo	0 40
Brown madder	2 10
Gamboge	0 50
Vandyke brown	1 15
Brown pink	0 30
———	
Iridian yellow	4 0
Cadmium yellow	4 0
Violet carmine	4 0
Aureolin	Unchanged.
Rose madder	4 0
Permanent blue	3 30
Vermilion	Unchanged.
Emerald green	0 45
Yellow ochre	Unchanged.
Indian red	,,
Venetian red	,,
Burnt sienna	,,
Chrome yellow	,,
Raw sienna	,,
Terra verte	,,
Chromium oxide	,,
Cobalt	,,
French blue	3 30
Ultramarine ash	Unchanged.

The same colours were exposed to dry ozonised oxygen, all moisture being excluded. The paper and pigment were carefully dried, and the oxygen had to bubble through a series of bulbs containing strong sulphuric acid, to absorb any moisture which might have been in the oxygen. In no case did the dry ozonised oxygen have any action on the pigments. The most fugitive came out of the exposure-tubes unaltered.

This, be it remembered, was the same when the exposure to light took place in dry oxygen. The pigments remained unchanged.

This experiment proved that unless moisture were present with the ozonised oxygen the test did not work.

It will be noticed that eleven of the first thirteen colours which in our list showed no change under the influence of light, were taken, and only one of them—French blue—showed any change under the influence of ozonised oxygen and moisture, and that was very small. Of the other twenty-six colours only twenty-three were experimented with, and all of them showed an alteration. Of the second thirteen in the list, seven were tried and all proved to be fairly stable colours, aureolin and vermilion, which under the action of light blackened, showed no deterioration; the others, after an exposure to the ozone, showed slight deterioration after about four hours. Of the thirteen most fugitive colours in the list, scarlet lake was omitted. Brown madder and Indian yellow appeared more stable than they did when exposed to light; the remainder followed very fairly the order of fugitiveness given in the list.

Mixtures faded under the influence of damp ozone more rapidly as a rule than did the fugitive colours by themselves. Where one of the colours was stable the fugitive colour completely disappeared, and where both were fugitive—as, for instance, a mixture of indigo and gamboge—both disappeared.

It might be thought that peroxide of hydrogen, which is used for altering the colour of hair and for other purposes, might be a substitute for the ozone treatment. So far I have found it quite inoperative in regard to pigments such as have been tested.

Returning for an instant to my own water-colour box, I show the results of the ozone treatment. The only case where any fading has taken place in any of the colours is that of rose madder, which had a most prolonged exposure. It will be noticed that where I have replaced a colour by a mixture having the same tint—e.g. Hooker's green, made of Prussian blue and aureolin—the colour is a stable one, since both the mixing colours are stable.

With oil paints the ozone test has so far, with me, been unsuccessful. The ozone seems to attack the medium, as the colour is so successfully locked up in it that very little effect is produced, even with the most fugitive colours. This is not what takes place when light acts on oil colours, for in a series of experiments (not yet published) made with them the same final results were obtained as with water-colours.

Digitized by Google

So far I have confined myself to water-colour washes, but the same method of experiment gives an answer at once as to whether a wall-paper will remain unaffected by light.

In my own house I have unfortunately had wall-papers which looked pretty and well suited to the rooms, but in the course of two or three years all the prettiness had gone, though a pattern remained. Of some of these papers I had spare rolls, and I tested them with the ozone treatment, and found that it gave the same class of fading as that which the exposure to light had given.

It is quite easy to diagnose whether a wall-paper will stand the light, and I always try and test them before I make a final choice. It is in the delicate tints that fading takes place. Where a paper is heavily coated with a pigment which, when applied more thinly, will fade, it may stand the light for a considerable time before being found out. I show numerous kinds of wall-papers which have been submitted to the test. In some cases the fading is slight but quite marked; in others the fading is much more marked, more especially with certain kinds of papers which have a green tint in them. In a good many cases the papers have been on walls of a room, and the fading is similar to that caused by the ozone.

The test for permanence of colour can be applied to ladies' dresses. Summer dresses are very often of beautifully delicate shades, and have parasols to match the dresses. A few inches of the material of a dress will be sufficient to indicate what may be expected to happen in a summer light. I believe it has often been remarked that at the seaside dresses "go" much more rapidly than at an inland place. The reason for this may be that there is more ozone and moisture at the seaside than there is inland. Ladies also inform me that abroad a dress may not fade in bright summer light when it inevitably would do so in our island. The air on the Continent is, as a rule, drier, and it may be that the want of moisture is the cause of the apparent stability of the colour. Wools and cotton-stuffs can be subjected to the same tests, but where the colours are on paper the tests are more rapidly carried out. The mordants often make the colouring matter more stable than it is on paper. Those dyes I have tried are on the dyed material.

THE ACQUISITION OF LAND BY PUBLIC AND QUASI-PUBLIC BODIES.*

THE report of the committee is divided into five heads, the second being "The Acquisition of Land by Public and Quasi-Public Bodies," and I have been asked to deal with this to-night from the promoter's point of view.

As the conclusions and recommendations of the Land Inquiry Committee relating to the procedure and practice in the expropriation of land for public purposes are the portion of the report appointed for consideration this evening, it may not be superfluous to read them *in extenso*.

"Section VIII.—Summary of Conclusions and Recommendations.

1. Notwithstanding provisions contained in the Housing Acts, 1890-1909, modifying the procedure in the case of insanitary areas and land otherwise acquired for housing purposes, the present methods of obtaining compulsory powers for the acquisition of land are cumbrous, dilatory, and expensive. Especially in the case of smaller local authorities, the difficulty and cost of obtaining these powers often prevent improvements from being carried out. Except in the case of schemes of great magnitude or novelty, recourse to Parliament should not be necessary.

2. Where compulsory powers are obtained, the procedure for assessing compensation laid down in the Lands Clauses Consolidation Acts is needlessly complicated and expensive. The provision that the promoters shall pay the whole of the costs unless the award is equal to or less than the promoters offer, is an encouragement to claimants to pile up costs unduly.

3. The constitution and working of the tribunals which assess the compensation are unsatisfactory. There are objections to leaving the determination of the amount of compensation payable to professional men in private practice.

4. The basis of compensation laid down in the Lands Clauses Consolidation Acts is indefinite, its interpretation admits evidence of an exceedingly speculative character, and it has enabled claimants to obtain awards largely in excess of the real value of the land acquired. The almost universal addition of at least 10 per cent. of the purchase price of the land as an allowance for compulsory acquisition is unnecessary and unjustifiable.

5. "Value to the owner" is unsatisfactory as a basis of compensation. Rateable value is not a suitable basis, since it does not pretend to represent the annual equivalent of the full capital value of the land. The only satisfactory basis for the assessment of compensation will be a valuation based on the market value of the land if sold by a willing seller.

6. The provisions in the Lands Clauses Consolidation Acts as to compensation for injurious affection to other lands than the lands taken enable large sums to be awarded for prospective and hypothetical values, and is unfair as between the owner whose land is taken and the adjoining owner from whom no land is taken, but who may be equally injured. Betterment charges are unsatisfactory for similar reasons—namely, the difficulty of assessing betterment and the unfairness of discriminating between owners who are similarly affected.

7. The provision in the Lands Clauses Consolidation Act that promoters are not allowed to take a "part only" of any house or building is a further cause of difficulty and expense.

8. The knowledge that the obtaining of compulsory powers and arbitration proceedings are so costly, and that the amount awarded will probably exceed the real value of the land, enables owners to exact very high prices in private negotiation from local authorities.

9. The fact that they are at such a disadvantage in exercising their compulsory powers compels local authorities to resort to the practice of buying lands through the medium of secret agents. This practice, though inevitable under present conditions, is open to considerable objection.

10. Local authorities are not, as a rule, allowed to buy land and hold it for future use. Consequently they cannot secure any of the increment in value due to the public services they provide. If they were free to do this, they would not only be able to obtain this increment, but also be better able to control the development of their area and the surrounding neighbourhood.

11. Quasi-public bodies, such as railway companies, &c., are placed in a similar position to local authorities with regard to the land they acquire compulsorily.

Following these conclusions the recommendations we make with regard to the public asquisition of land may be summarised as follows:—

1. Compulsory powers for the acquisition of land needed for public purposes should be obtained in these ways:—

(*a*) For certain specified purposes land should be acquired compulsorily by means of a resolution passed by the local authority requiring the land.

(*b*) For purposes not included in (*a*) compulsory powers for the acquisition of land should be obtained by means of an Order of a Government department, which need not be confirmed by Parliament.

(*c*) Where the magnitude or novelty of the proposals demand it, compulsory powers should be sought from Parliament by means of a private Act under a simplified procedure.

2. The tribunal for assessing the sum to be paid for the purchase of lands, and compensation for severence and disturbance, in all cases of compulsory purchase should be the Judicial Land Commissioners. The Commissioners should have power to award costs in any proportion as between the two parties, to limit the number of witnesses, and to exclude counsel.

3. The basis of compensation for lands taken should be the price they might be expected to realise, if sold in the open market by a willing seller, and this sum should be assessed on the principles laid down in the Finance (1909-10) Act, 1910, for determining the "total value" of land. No additional allowance should be made for compulsory purchase.

4. No compensation should be paid for injurious affection of other lands, nor should any allowance be made for betterment. Compensation should be paid for damage due to severance and disturbance.

5. Promoters should have power to acquire a part only of land or buildings.

6. Local authorities and Government departments should

*** Abstract of Paper by Andrew Young (Member of Council), dealing with the report of the Land Enquiry Committee, read at the Ordinary General Meeting of the Surveyors' Institution, held on Monday, December 14, 1914.**

Digitized by Google

have powers to purchase land in advance of their immediate requirements."

The compulsory purchase of lands may roughly be divided into two main divisions: (1) For public purposes, and (2) for purposes of public companies operating principally for private profit. In a paper read before the Institution some two or three sessions ago, it was pointed out that this distinction was drawn, even in early days by Parliament and the Courts, between these two main divisions, and it is unnecessary for me here to repeat the reasons. I propose, as the time at my disposal is short, to limit my observations to the first division, although much I may say will apply equally to the purchase of land by private promoters.

The subject may conveniently be considered under three heads:—

1. Method of obtaining the specific powers.
2. Basis of compensation and matters incidental thereto.
3. Tribunal for assessing compensation.

I.—Method of Obtaining Specific Powers.

The Land Inquiry Report sets out with a wealth of detail the varying methods by means of which promoters may now obtain compulsory powers, the keynote of which is that they are notoriously cumbersome and proverbially expensive.

Generally speaking, a special Act of Parliament or its equivalent is necessary, the effective work for which must be completed before the month of November in any year; and to secure this end the decision of a local authority to apply for powers in practice must be taken before the end of July. As special Acts usually receive the Royal Assent in August, it not infrequently happens that, owing to the necessary preliminary work to comply with Standing Orders of Parliament, powers cannot be obtained for some eighteen months, and may be nearly two years, after the occasion when the powers might usefully have been exercised.

Procedure by way of Provisional Order is sometimes advocated as an improvement on the ordinary Private Bill legislation, and at present the principal avenue of legislation in London on these lines is for educational purposes.

As the preliminaries for a Provisional Order must be completed at about the same time as a Private Bill, and no provisions exist for intermediate necessities being dealt with, there is no advantage over the Private Bill procedure.

Probably the earliest Act giving powers to a local authority to acquire property without the necessity of obtaining the specific authority of Parliament or a Government department is Michael Angelo Taylor's Act. This is not exerciseable by the central authority in London, but the powers have devolved upon the Metropolitan Borough Councils, and are put into force merely by a resolution, which may, however, be impugned in the Courts on the ground of *mala fides*.

A gradual simplification of procedure has followed, the simplest being the putting in force of compulsory powers of acquisition by a mere resolution of the authority charged with a public duty, for the exercise of which the land proposed to be taken is required.

In my opinion it would be perfectly safe for responsible public authorities to be vested with general powers, exerciseable by resolution only, compulsorily to acquire property required for the proper discharge of statutory duties. This would appear to conform with the views of this Institution in the reply of the Council of this Institution to the inquiries of the Land Inquiry Committee as follows:—

"Possibly, however, some further means might be provided by which responsible authorities, where the interests at stake are not of overwhelming importance, might be relieved of the expense of obtaining Parliamentary sanction. In London, for instance, the Metropolitan Paving Act of 1817, associated with the name of Michael Angelo Taylor, permits the City Corporation and Metropolitan Borough Councils to take property, or portions of a property, for a street widening without going to the expense of a special Act.

"The procedure under this Act is complicated and unsatisfactory, but the principle is a useful one, and might with advantage be extended to other large municipalities."

There would appear to me to be no valid reason in restricting such general powers to municipalities: "responsible authorities" might include statutory companies who might be relieved of the necessity of obtaining specific statutory authority for property required for the proper discharge of their statutory duties. Safeguards by way of approval of a Government department or otherwise, which might be considered essential in the case of a company operating principally for private profit, would probably be considered superfluous in the case of a public authority whose actions are open to public criticism, and who under its constitution must within a limited period seek the suffrages of its constituents.

II.—Basis of Compensation and Matters Incidental Thereto.

Value to Owner.—Probably the portion of the subject around which the greatest controversy will arise is that relating to the basis of compensation. It is common ground in this room that the basis of compensation is substantially the value to the owner and damage to other lands belonging to him by reason of the taking of the part required. This basis is now firmly established, principally by means of decisions of the Courts, as there is no specific provision in the Lands Clauses Acts directing exactly what is to be the basis.

Market Value.—In many recent statutes the basis of compensation has been specifically considerably modified. Legislation relating to insanitary areas has always made special provision as to the basis on which the compensation is to be assessed.

The original Housing Act of 1875 fixes the basis as that of market value. In the course of years, however, in connection with the large and costly schemes carried out immediately following that Act, a tendency had developed whereby substantially the only difference between Lands Clauses procedure and Housing procedure was the omission of the 10 per cent. My experience goes back to those years, and I well remember how prominent members of the profession, in giving evidence under the Housing Acts, appeared to consider that the basis of market value intended under the Housing Act was not the same as what was commonly understood to be value in the market. It became a conventional value; much in the same way as there were indications some years ago that valuations under the Lands Clauses Acts were purely conventional and had no real regard to the proper basis that should be adopted. This gave rise to such dissatisfaction that a strong Commission was appointed in 1888 to investigate the whole question, with the result that the law relating to insanitary areas and clearances was codified and amended in the Housing of the Working Classes Act, 1890.

The compensation provisions of this Act take the form which has frequently been referred to as penal. For our present purpose one need only observe that while the basis was still reaffirmed as fair market value at the time of valuation, it further provided that, if the rental arising from the property were enhanced by user for illegal purposes or by overcrowding, the enhanced rental obtained by such conditions must be disregarded and a proper rental assumed having regard to the fair and proper use of the premises, and this adopted for the purpose of calculating the compensation. Whether the actual rental derived or the assumed fair market rental that might be obtained was to be adopted for the capitalisation, regard was specially directed to the state of repair, and if, as was nearly always the case, the property had been neglected and required a substantial sum to put it into a proper habitable condition, the amount of such expenditure was to be deducted from any capitalisation; and it also contemplated the possibility of the value being assessed merely as that of a vacant site to which was added a sum in respect of the old materials.

In some recent statutes dealing with different matters entirely, the purchase price is to be determined by what the property would fetch in the open market. I am referring to the Ancient Monuments Consolidation Act, 1913, where a property the subject of a preservation order may be purchased by the Office of Works at the price it would fetch in the open market.

There has been no legal decision as to what constitutes value to owner, nor indeed until recently has there been of market value. But recently the term "value in the market as between willing vendor and purchaser," of which we have heard much in connection with the Finance Act, 1910, has been legally defined. In the case of Inland Revenue *v.* Clay and Others and Inland Revenue *v.* Buchanan and Others the Master of the Rolls expressed himself as follows:—

"The context before us has turned mainly upon the words 'open market' and 'willing seller.' I think the view ultimately taken by counsel for the appellants, and also for the respondents, as to the meaning of 'open market' is correct. 'Open market' includes a sale by auction, but it is not

Digitized by Google

confined to that. It would include property publicly announced in the usual way by insertion in the lists of house agents. But I think that it does not necessarily involve the idea of a sale without reserve. I can see no reason for excluding from consideration the fact that the property is so situated that to one or more persons it presents greater attractions than to anybody else. The house or the land may immediately adjoin one or more landowners likely to offer more than the property would be worth to anybody else. This is a fact which cannot be disregarded. The Solicitor-General ultimately admitted that some regard must be had to the facts. But he urged that one ought only to consider, first, what an outside purchaser would give, say, £750, and then allow the adjoining owner one more bid. In other words, something very small beyond the £750.

"We had our attention called to the valuable judgments of Lords Johnston and Salvesen in the recent Scotch case of Glass *v.* Commissioners of Inland Revenue (unreported), and I accept their view of the meaning of the words 'open market.' The price at which the property was sold in 1910 is not the test of the gross value in April 1909, but it cannot be disregarded. I adopt the language of Mr. Justice Scrutton: 'He (the Referee) was right in this, not because of the sale for £1,000, but because of the reasonable expectation that a willing seller could get £1,000 or more from the nursing home.' An 'open market' sale of property 'in its then condition' presupposes a knowledge of its situation with all surrounding circumstances. To say that a small farm in the middle of a wealthy landowner's estate is to be valued without reference to the fact that he will probably be willing to pay a large price, but solely with reference to its ordinary agricultural value, seems to me absurd. If the landowner does not at the moment buy, land brokers or speculators will give more than its pure agricultural value with a view to reselling it at a profit to the landowner.

"It is for the Referee, whose competence is not challenged, to arrive at a figure. The Court ought not, as a rule, to review his decision on what is in truth a question of fact. I see no ground for supposing that there has been any misdirection in point of law.

"The other point is as to the meaning of 'willing seller.' It is urged that Mrs. Buchanan never was a willing seller; that she never wished to vacate the house in which she was living, and that it was only after pressure from the trustees that she agreed to sell for £1,000. I am disposed to think that a willing seller is a person who is a free agent and cannot be required by virtue of compulsory powers to sell, and that Mrs. Buchanan was a willing seller when, in 1900, she voluntarily agreed to accept £1,000. If, however, contrary to my view, she was not a willing seller, the problem still remains, for the existence of a willing seller, whether Mrs. Buchanan or not, must be assumed for the purpose of the section."

This view of market value is that which has been expressed in this room on previous occasions. An owner is not bound to accept any price that may be offered, and transactions in the auction-room are not conclusive as to market value. A willing vendor not under compulsion to sell may anticipate a purchaser to whom the property possesses special advantages of a general kind. This definition seems to bring the basis of market value extremely close to that of value to the owner as we know it in practice. It also includes so much of the doctrine of special adaptability as should properly be brought into account, while excluding that distortion of it which offends the maxim that promoters should not pay for the value to those vested with statutory powers which a private owner without such powers could not realise.

In these circumstances a claimant would not, in my opinion, be harshly treated if, for land expropriated for a public purpose, he were paid the full market value of the property taken. In these words it is intended to convey that the price to be paid would be that which a willing vendor would accept from a willing purchaser. This connotes no compulsion on the vendor to accept any price a purchaser may offer, and has no necessary relation to the figures realised at a forced sale under the hammer. Moreover, a price arranged on such a basis would be fixed only after consideration of injurious affection and of betterment, and so obviate the discussion of these matters as separate items of claim.

Another subject having an important bearing on the question of value is that flowing from the principle embodied in Section 92 of the Lands Clauses Act: "No party shall at any time be required to sell or convey to the promoters of the undertaking a part only of any house or other building or manufactory if such party be willing and able to sell and convey the whole thereof."

It was early found that this inflicted hardship upon promoters, and various modifications were secured from time to time until at present the Model Clauses provide that parts can be taken if in the opinion of the tribunal assessing compensation such part can be taken without "material detriment" to the remainder. In addition to private Acts, this in effect has also been embodied in recent public Acts such as the Housing Act, 1890, and the Development and Road Improvement Funds Act, 1909.

Allowance for Compulsory Sale.—It has been customary in compulsory purchases to add to that part of the compensation which represents the value of property taken an allowance which varied according to the district, but which in London is invariably 10 per cent.

Legislation of recent years, and particularly a series of legislative enactments dealing with insanitary property, has expressly excluded this allowance. In the series of Housing Acts from 1875 to 1882, and the amending Act of 1890, this additional allowance is expressly excluded in the case of the acquisition of insanitary property. In the Housing and Town Planning Act, 1909, this elimination is not only continued as to insanitary property, but is extended also to the purchase of sites for the erection of lodging-houses.

Legislation of a different character has also disallowed this customary allowance from the Small Holdings and Allotments Act, 1907, and the Development and Road Improvement Act, 1909.

If in compulsory-purchase cases the basis be adopted of market value, the unwilling vendor would be only on the same footing as to price as a willing vendor, and as a solatium for compulsory expropriation an allowance of, say, the 10 per cent. might properly be added to the market value. This should be provided by statute instead of relying upon custom.

These observations relate to property of an ordinary character required for usual public purposes. In my opinion there should be no weakening, but rather a strengthening, of the present penal compensation clauses specially applicable to insanitary property.

III.—Tribunal for Assessing Compensation.

At the present time the normal tribunal in compensation cases is a jury of non-experts, although the claimant has the option of having the value determined by an arbitrator.

The tendency of late years, however, in public Acts has been the elimination of a jury and the substitution of a sole arbitrator.

There is no doubt in my mind that the most satisfactory, because it is the most reliable, tribunal is one of trained experts, and, failing a perpetually constituted tribunal, a single arbitrator of standing is to be preferred. This would accord with the trend of modern legislation.

The Land Inquiry Committee have a novel solution for this problem as set out in the following terms:—

"*Tribunal and Procedure.*

"(*a*) That in all cases where land is acquired under compulsory powers, the final determination of the purchase price, the assessment of the compensation for severance and disturbance due to the claimant, and the apportionment of the compensation as between several claimants, should be determined by the Judicial Land Commissioners.

"(*b*) That the procedure for determining the amount of compensation for the land taken should be as follows:—

"(1) At the time of applying for compulsory powers the promoters should serve a notice on the district valuer and all interested persons as to the lands to be acquired.

"(2) If and when the compulsory powers are obtained the district valuer should assess the market value of the property to be acquired, as at the time of the application for compulsory powers, provided that where the owners or persons interested are unable to agree to the valuation, they should have the right to appeal to the Land Commissioners against the valuation of the district valuer."

It is to be observed that, under these proposals, the district valuer is, in the first instance, to assess the market value of the property, presumably as a whole; and as many of the owners of interests in a property may not know all the particulars to deal with the other interests, or with the whole, it must follow that objections must be made to all such valuations if injustice either to the promoters or to

Digitized by Google

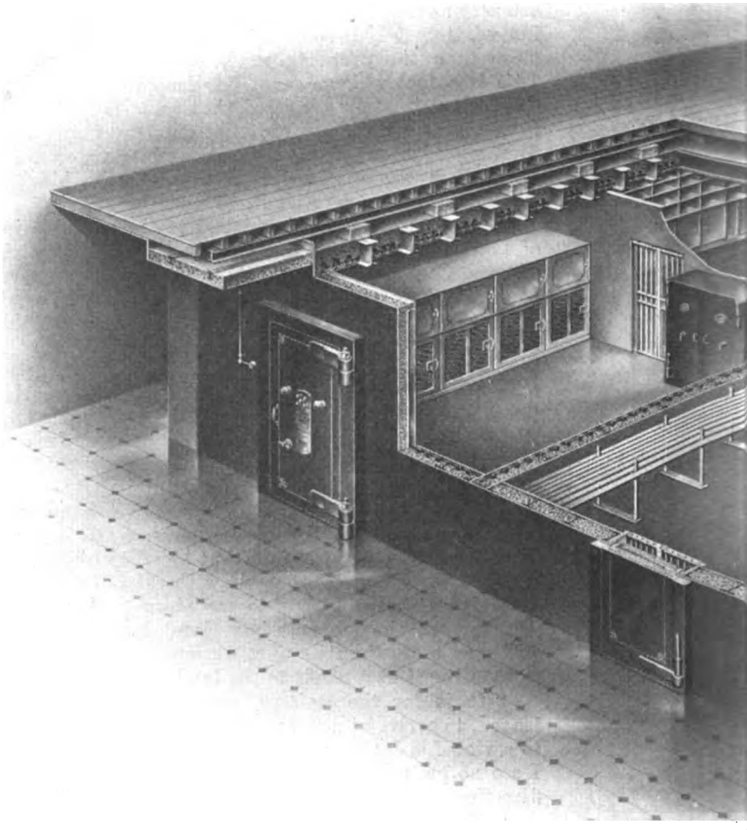
owners interested is to be obviated. In the event of non-agreement there would be an appeal to Land Commissioners, not against the valuation of the various interests, but against the value of the whole property, when, presumably, not only would there be a contest as between the promoters and the owners of each interest, but as between the owners of the various interests themselves. Moreover, the effect of such a method of procedure would be to reduce almost to vanishing point the possibility of arrangements by negotiation between the promoters and the owners of any interest, so that the amount consumed in costs, which the Land Inquiry Committee so much deplore, would be greatly increased. I do not know that as surveyors merely looking at it from an interested standpoint we need object, but it would not, I venture to think, be to the best interests of the public or of our profession.

I think it is obvious that the scheme suggested by the Land Inquiry Committee is not practicable. There is no doubt that the appointment of a skilled tribunal upon which the surveyor should predominate would be best, and failing this a single arbitrator. It is, however, particularly essential that questions of value should always and only be determined by a tribunal capable by its experience and personal knowledge of testing the evidence given before it.

Summarising, my conclusions are:

1. The Land Inquiry Committee have established their case, that the present method by means of which promoters now obtain compulsory powers are notoriously cumbersome and proverbially expensive. Although I am not in complete agreement with them as to the remedies they suggest, I think responsible public authorities might be vested with general powers allowing them by resolution to acquire compulsorily such property only as is required by them for the proper discharge of existing statutory duties.

2. I think the Land Inquiry Committee have established their case that the time has arrived when there should be a statutory definition of the basis upon which compensation should be awarded. In view of the fact that the term "value in the market as between willing vendor and purchaser" has now been construed by the Courts, I am of opinion that their suggestion that this should be the basis in the future is one that might be adopted. As, however, compulsory expropriation means that the vendor is unwilling, it would appear fair and proper that he should have, in addition to the value in the market as between the willing vendor and purchaser, some statutory solatium for being compelled to sell. Although not on the grounds for which it was originally adopted, I think this solatium might represent 10 per cent. upon the price as determined in accordance with the definition. But the penal clauses of the Housing Acts for insanitary property should be retained if not strengthened.



3. I think the Land Inquiry Committee have established their case that the time has arrived when there should be an alteration in the normal tribunal for determining price where property is taken compulsorily. The scheme suggested by the Land Inquiry Committee is not a practical one. In my opinion the best tribunal would be one upon which surveyors would predominate; but, failing this, the general adoption of a single arbitrator, who should have complete powers enabling him to disallow witnesses whom he considers to have been unnecessarily called and also any costs he considers to have been caused or incurred unnecessarily.

MESSRS. BECKETT'S BANK, LEEDS.

AN interesting example of modernising the security accommodation and adding to the banking space in an old and existing building has recently been carried out for Messrs. Beckett & Co. at their Leeds bank, from designs and under the direction and supervision of Mr. Walter Brierley, F.R.I B.A., County architect of York.

The strong rooms were originally on the ground floor, and, in order to provide space for the larger and more modern ones, a basement has been prepared under the banking hall by excavating the earth, removing certain supporting walls and building down a storey.

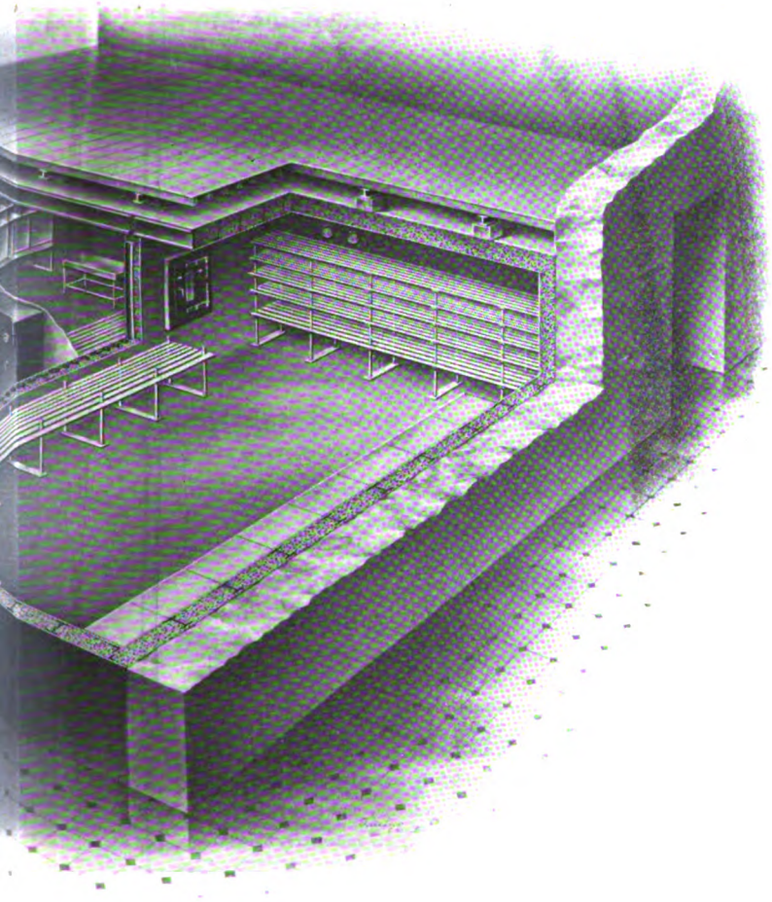
This work was entrusted to Mr. J. T. Wright, builder, Leeds, and was accomplished without any interference with the work of, or inconvenience to, the bank. Before describing the construction of the strong rooms it is necessary to say that they have been made thoroughly fire and burglar proof, and special attention has been given to the design of

MESSRS. BECKETT'S BANK, LEEDS.—THE "C
(SECTIONAL PROS

their roofs, so as to ensure their withstanding any shocks which may be brought about by the collapse of the building during fire, and also to enable them to carry the banking hall floor.

The construction of the steel treasury and deed rooms was carried out by the Chatwood Safe Company, Ltd., of Bolton, Lancs.

The stronghold, which is some 40 feet square, is of island form, being surrounded by patrol corridors. It is divided into two equal parts, one half being the burglar-proof treasury for the safe keeping of cash and bearer bonds, and the other half for the storage of deeds, &c.



The treasury portion is constructed throughout of steel plates reinforced by a series of interlocking hard steel rails and girders, which are secured to the plates by numerous rivets and screws, and have the interstices between them filled with hard-setting Aberdeen granite and cement concrete.

The deed-room portion is constructed of steel plates reinforced by steel girders, which are attached to the plates and embedded in a 10-inch to 12-inch wall of Aberdeen granite and cement concrete.

The roofs of both rooms have been strengthened by numerous 12-inch and 14-inch girders and 18 inches of concrete in addition to the construction already described.

The doors are constructed of the Chatwood "intersected" steel, which has been tested by various experts and different methods in places as far apart as London, St. Petersburg, and South Africa, and has against every method of attack proved invincible. It may be mentioned in this connection that a Chatwood "intersected" steel safe belonging to Mr. Mark Rubin, a pearl merchant, of Holborn Viaduct, London, E.C., successfully withstood a week-end attack made upon it by burglars equipped with the oxy-acetylene blowpipe, and preserved its contents of £80,000 worth of pearls intact.

Digitized by Google

"CHATWOOD" STRONG-ROOM INSTALLATION
(PERSPECTIVE VIEW)

The doors leading to the treasury we here illustrate are built up of slabs of "intersected" steel 4 inches thick, and are secured on all sides by sliding round cold-drawn steel bolts 2¼ inches in diameter. The bolts are secured by two special twelve-lever double-bolt double-bitted key locks and a combination letter lock, which closes the keyholes on the inside surface of the door and thus prevents the insertion of explosives into the locks through the keyholes, or the fraudulent use of the keys. The doors, which are hung on special hinges and can be readily adjusted in case of wear, are easily manipulated, although weighing as much as five tons.

The vestibules of the rooms are fitted with strong steel grille gates controlled by automatic locks, and are intended for use during banking hours.

The strong rooms are furnished with steel-drawer filing cabinets for securities, steel cupboards for cash, steel ventilating shelving for storage purposes, and also movable steel tables. They are lighted by numerous electric lights controlled by various switches inside the rooms, and are furnished with an electric stove; but the electric wiring is so arranged that the current cannot be left on in the rooms when the main doors are closed.

The ventilation of the strong rooms is carried out by drawing warm dry air through them by means of extractor fans placed outside the deed-room, and in such a manner that the air comes through the grilles at the entrances at one end of the rooms to the ventilators at the other. The ventilators automatically close in case of fire. The strength and solidity of the whole installation will be better gauged when it is stated that nearly 200 tons of steel and over 240 tons of Aberdeen granite and cement concrete have been employed in its construction.

In short, the strong rooms and their equipment may be justly described as among the finest, if not *the* finest, installation in the North of England.

WORKING-CLASS HOUSES.*

THAT there is a shortage of working-class houses in the majority of districts but few persons to-day are not ready to admit, while in practically every village, town, and city are numbers of dwellings which only by the greatest stretch of imagination can be termed homes, and certainly cannot be considered fit for habitation.

Of course, I anticipate my readers will be prompted to inquire the cause, since cause must precede effect, and in reply I would suggest that the most powerful has resulted from lack of power to close dwellings as they became unfit without having recourse to judicial proceedings, proceedings often unsuccessful owing to those influencing factors so well known to sanitary officers, and which have always served as an effective brake to necessary progress. And while the old dwellings remained habited—and, sad to say, that there is always a number of persons ever ready to tenant the worst places in preference to the better—the demand for additional dwellings has naturally been weakened. At the same time, owing to the cost of building operations having increased disproportionately to the cost of wages, the rate of building has slackened and the shortage has gradually become more and more acute, and this shortage has done much further to prolong the existence of some of the slums with which this country abounds.

It is not the intention of the author, however, to take up time with the past causes and present effects, but rather to outline some future policy in regard to the dwellings of the workers, and he must necessarily therefore leave those dwellings which are undoubtedly unfit to the mercy of the local authorities who, if they would be more willingly guided by their health officials, would soon obliterate one of the greatest reproaches to England's greatness.

Assuming that all the unfit dwellings were effectually disposed of by demolition, we would then have a large number left which, while not having reached the hopeless stage, are sufficiently bad to require partial reconstruction in order to make them habitable. This reconstruction is generally a difficult problem, and one for which it is almost impossible to define a code of requirements which can be reasonably carried out in all cases; and were such possible, so divergent are the views of various officials and authorities, that the practice in no one town agrees with another. In some isolated instances where an alteration or reconstruction is agreed to the local authority require the local building by-laws to be complied with, while in others the opposite extreme is the case, any attempt at securing some improvement being considered to be sufficient. Some time ago the author, on inquiring of a number of authorities their practice in respect of their attitude towards old dwellings which required reconstruction, was very much impressed by the varied manner in which the work was regarded, and he came to the conclusion that in very many instances the dwellings which were now the most insanitary and unsuitable were simply being given a new lease of life, and would again become in a very few years far behind the minimum housing requirements, and when to these were added those which by virtue of age or unsuitability were falling due to be demolished, the number of uninhabitable dwellings in the neighbourhood would become quite disproportionate to the habitable; in fact, the housing trouble would have increased in intensity.

Now, in order to guard against the possibility of the perpetuation of slumdom by the continual introduction of small improvements in order to secure a temporary extension of life, the author considers that a definite code of minimum requirements should be prepared by every authority, and to this code all properties which are being improved or reconstructed under the Housing Acts should conform. A suitable code should refer to the following matters for the reasons given:—

Foundations.—Where additions are being made to the heights of buildings the foundation should be sufficiently deep and firm to bear the additional weight. The author has seen instances where additional work has had to be removed in view of a threatened collapse.

Drainage.—This, for obvious reasons, should comply with the model requirements in all respects.

Dampcourse.—Many of the old houses bear no traces of a dampcourse, and, although some authorities insist that it should be inserted in the old walls, others do not. The author considers that it is seldom effectually provided unless

KEYSTONA
FLAT FINISH

Possesses all the durability of oil paint at half the cost.

AN OIL PAINT WITHOUT A GLOSS!
WASHABLE AS MARBLE.

AN OIL FLAT.
Not a water flat.

KEYSTONA was placed on the market ten years ago, and at once achieved a phenomenal success in North America (including Canada) from the Atlantic to the Pacific coasts. During the year 1910, 187,500,000 square feet of wall surface were covered with **KEYSTONA.** This is equal to an area of over four thousand acres. **KEYSTONA** is now manufactured in England, and is meeting with as great a success in this country as in America. **KEYSTONA** is more sanitary than any other paint, and is therefore largely used for large public buildings, schools, hospitals, churches, etc.

KEYSTONA has rung the death-knell of Water Paints.

KEYSTONA is an Oil Flat finish giving rich stucco effects unobtainable with either Oil or Water Paints, possessing all the durability and washable properties of Oil Paint.

KEYSTONA is 40 per cent. cheaper than Oil Paint, and only slightly, if any, dearer than Water Paint, giving vastly superior and lasting results.

KEYSTONA enables one man to flat large surfaces, where two and three would be required if any other material were used.

KEYSTONA is free from lead, works like cream, is a perfect white, never goes yellow, and is washable as marble.

KEYSTONA can be washed until it looks like new paint. Oil Paint similarly treated would show shady.

WHAT IS KEYSTONA?

Some of its Advantages.

KEYSTONA is proof against the effects of striking matches, and pencil marks. Such marks can be washed off **KEYSTONA** with facility. On Oil Paint they are a permanent disfigurement.

KEYSTONA can be tinted with any good Oil tints; the priming coat mixed with preparatory liquid protects all colours from the action of new lime and moisture.

KEYSTONA is *guaranteed* never to shell, however many renewals may follow from time to time.

KEYSTONA White is supplied of heavy consistency, requiring one to one-and-a-half pints of Turpentine or Turpentine substitute to the gallon for proper working consistency, reducing the cost from 1/6 to 2/- per gallon.

KEYSTONA can be used with equal advantage on wood, iron, and any other surface, and supersedes all Flat Enamels.

the walls are actually pulled down. The alternative which the author suggests, and which has always been found effective, is to render in cement and sand, instead of the usual lime plaster, all the ground-floor walls and partitions.

Floors Below Ground Level.—In the author's district, owing to its very hilly nature, a large number of the houses have their floors below the ground on two or three sides. In all such places cavities placed either internally or externally should be insisted upon.

Conveniences.—Every dwelling should be provided with a separate convenience, though here care must be taken to see that (in the case of older parts where probably one or two conveniences serve for a number of houses) the conditions for the houses not under consideration are not made worse by the owner disallowing the use of one of the conveniences to others so as to provide one separate for the house under consideration.

Air Space.—This is probably one of the most contentious items in connection with the reconstruction of old property, but the author considers that the minimum of 150 square feet at the rear should be required in all cases, for even with this minimum it is possible to have as many as fifty houses to the acre. If this cannot be obtained, no scheme of reconstruction should be considered.

Height of Rooms.—This is generally found to be another matter on which building owners are reluctant to move; but, without exception, no rooms should be agreed to which are less than 8 feet in height. In every case where an additional room is added the height required by the building by-laws should be insisted upon. In the author's district by-laws are in force which specially require this.

Damp Walls.—Where the walls show signs of non-resistance to the penetration of rain, the two sides exposed to the severest weather should be cemented.

Windows.—In all cases every window ought to be made to open, and should be enlarged where necessary in order to secure the Model By-laws minimum. The author finds that in many circumstances even this is too little.

We now come to the question of providing new houses, which must be built either by private enterprise or the local authority. In the author's town some considerable steps have been taken by the authority to encourage private enterprise by adopting the Small Dwellings Acquisition Act, under which any local authority can borrow money for the purpose of lending to any person who desires to purchase a house for the purpose of dwelling in it himself.

To make the Act well known as well as popular proved to be quite a difficult matter, and it was only by eventually circularising the local builders, and later the inhabitants, that a move was made, and in the result the author has valued during the last two years about forty new dwellings having an approximate value of £10,000.

But while this Act provides the means of greatly assisting the thrifty worker to become the owner of his own house, it does not in any way affect the demand for increased housing accommodation, and most authorities are faced with the prospect of large housing schemes, and of having to continue promoting schemes in the future, for without doubt municipal housing has come to stay.

Since the number of authorities embarking on housing schemes is very much on the increase, it would be well, seeing that all work has to be executed under the same Acts, if some definite ideas were agreed upon and adopted with a view to placing all new schemes as far beyond the possibility of slumdom as means and circumstances would allow, and if a real attempt were made to achieve the ideal instead of the usual tendency to anticipate the realisation of the oft-repeated story of wonderful five or six roomed workmen's houses, with all appurtenances, &c., at £100 or less (said to be possible by some would-be housing expert), better housing would result. It is really astonishing how regularly the £100-house story appears and the credence which is given to it by intellectual men, a fable which the author anticipates, will soon be relegated to Andersen's or Grimm's fairy book. Such houses may have been possible two or three decades ago; to-day they are as remote as the Millennium.

Now the author considers an excellent lead to authorities has been given by the promoters of several of the garden village schemes, and he is of the opinion that good serviceable and attractive workmen's houses can be erected under the present Housing Acts embodying the best features of modern garden city dwellings, having environments both pleasing and practicable in character, and capable of being let at a rental quite within reach of those people for whom they are intended. If all local authorities would but realise this, instead of laboriously copying the speculative builder, their schemes would be more likely to meet with public approbation than is the case at the present time.

Consider what should be embraced by a suitable scheme under the Housing Acts. In the first place every effort should be made to prevent the new being contiguous to the old. The higher-lying ground should be selected in preference to the lower, and if in a valley having steep sides, such as are peculiar to Wales, let the site be on the northern side.

The number of houses to an acre should not exceed twelve, and in a block form. When the latter is effected it is unnecessary to construct back streets, which, of course, account for a considerable expense. Complete privacy should be secured for every house (1) by arranging that the external doors are as far apart as possible, and (2) by erecting a short wall between every house at the rear, so that operations may be carried on at the rear of the dwellings without being casually observable from the house adjoining.

Rooms.—Vary the number of rooms per house, and provide a parlour, if possible, which can be used as an auxiliary bedroom. In a recent inspection of the houses he had erected without parlours, the author found that no less than 70 per cent. of the tenants were living in the scullery, they having converted their large living-rooms into parlours.

Windows.—None should be less than one-sixth the floor area, and all should be made to open: the ordinary sash windows are much more serviceable and satisfactory than the casement.

Drains.—The branch drains to the main branch should be as short as possible, and intercepting traps should be avoided, and ventilation pipes always carried up above the main roof.

Ashbins.—Provide every house with a covered portable ashbin, and renew when necessary. It is the most effective way of securing healthful conditions in this department.

Bath, &c.—Provide every house, however small, with a bath, which seems to be generally favoured on the ground floor. Of course, a bath means hot water, and this can be most economically provided by means of a simple combination arrangement. For the houses in South Wales, where hot water is required for the miner's daily bath, the author found the "Model Cottager" to be an excellent contrivance.

Cupboards.—Provide at least one cupboard upstairs and two downstairs, in each case reaching from the floor to the ceiling.

Back Additions.—These should not be permissible unless kept less in width than one-third of the frontage, and in depth less than one-third of the depth, of the main building.

Generally.—Other matters of construction are largely a question of taste or by-laws.

Regarding the appearance, disposition, and environment of the houses, it is here that the least attention is given and here that the most is needed. Vary, as far as reasonable, both the distance from the street and external treatment of the blocks in order to avoid that monotony so common to the work of speculative builders. Do not forget that the backs of the houses always form an elevation from some point, and generally deserve as much consideration as the front. Avoid the stereotyped brick forecourt walls and rails, and plant instead suitable privets, and, in order to give some encouragement to the incoming tenants, plant a few shrubs in the privet encircled forecourt. In all the spaces between the blocks plant a larger tree of the evergreen type, so as to break to the eye the continuity of the blocks. Where larger spaces occur rail these in and plant with suitable shrubs, and, along with spaces between blocks, reserve for attention by the authority Do not forget the children, and if you cannot provide a large open space in the middle of your colony of houses which can be viewed from every house provide one somewhere else; but provide it. Lastly, provide sufficient ground for vegetable growing by the tenants, either in connection with the houses or in the form of allotments contiguous to their dwellings.

The author has recently carried out a scheme of 136 dwellings of a small type which embodies all the foregoing features, and as the balance-sheet he provided to the Local Government Board gives some indication of what was done, and may be of interest, it is appended.

THE
Architect and Contract Reporter.
FRIDAY, JANUARY 1, 1915.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addresed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than* 2 P.M. *on Thursdays.*

COMPETITIONS OPEN.

BRADFORD.—March 31.—The Corporation invite competitive designs for the re-planning of streets in the central area of the City of Bradford. Mr. Reginald Blomfield, R.A., will act as assessor. Particulars may be obtained on application to the undersigned, accompanied by a deposit of £1 1s., which will be returned on receipt of a *bonâ-fide* design. Mr. Frederick Stevens, Town Clerk, Town Hall, Bradford.

DONCASTER.—Jan. 23.—The Town Council invite architects to submit designs for the laying out of a site of about twenty acres at Carr House, Doncaster, and the erection of 102 workmen's dwellings on four acres thereof on Garden City lines. Copies of the particulars and conditions of the competition may be obtained at the office of Mr. R. A. H. Tovey, Town Clerk, Doncaster.

LIVERPOOL.—Feb. 8.—The Corporation invite designs for workmen's dwellings, to accommodate about 500 persons, and proposed to be erected on the site known as the Rathbone Street area. Premiums of £100, £50 and £25 respectively are offered for the first three selected designs, and the Council have appointed Mr. Henry Hartley, F.R.I.B.A., as assessor. The first premiated design will become the property of the Corporation. A plan of site, together with a copy of the printed conditions and instructions, will be forwarded to the applicant on payment of a deposit of £1 1s., which will be returned on the receipt of a bona-fide set of drawings. Mr. E. R. Pickmere, town clerk, Municipal Offices, Liverpool.

MACCLESFIELD.—Jan. 31.—The Lands and Town Development Committee invite competitive plans, &c., for a housing scheme from the local architects and builders. Plans, specification, and estimate must be deposited not later than January 31, 1915, marked on the outside cover, "Housing Scheme." Mr. S. C. Baggott, Borough Surveyor, Macclesfield.

CONTRACTS OPEN.

ASHTON-UNDER-LYNE.—Jan. 16.—For erection of Mossley Road Council School, to accommodate 600 children, for the Ashton-under-Lyne Education Committee. Deposit £3 3s. Messrs. Eaton, Son & Cantrell, architects, Stamford Street, Ashton-under-Lyne.

BRADFORD.—Jan. 5.—For all trades required in erection of a medical officer's residence at the City Hospital, Bierley Hall, for the Corporation. The City Architect, Town Hall, Bradford.

BRISTOL.—Jan. 11.—For the construction, delivery, and maintenance of a ferro-concrete built tobacco warehouse at Bristol, for the Docks Committee. (Mr. W. W. Squire, engineer, Engineer's Office, Cumberland Road, Bristol.) Send £5 deposit by separate letter to the Secretary of the Docks Committee.

BROMPTON (KENT).—Jan. 5.—For erection of a block of dwellings in Middle Street, for the Gillingham Town Council. Deposit 10s. 6d. Mr. J. L. Redfern, borough surveyor, Council Offices, Gardiner Street, Gillingham, Kent.

COLCHESTER.—Jan. 20.—For erection of tuberculosis pavilion, scarlet-fever ward, and alterations and additions to the administration block at the Infectious Diseases Hospital, Mile End, for the Borough and Port Health Committee. Mr. H. Collins, A.M.I.C.E., borough engineer and surveyor, Colchester.

COLEHAM.—Jan. 12.—For building new classrooms and making other additions and alterations to the Trinity Infants' School, Coleham, for the Shrewsbury Education Committee. Deposit £2 2s. Mr. W. Scott-Deakin, F.R.I.B.A., architect, 12A Pride Hill, Shrewsbury.

COVENTRY.—Jan. 13.—For enlargement of the Frederick Bird Council School, Swan Lane, for the Education Committee. Messrs. G. & I. Steane, architects, 22 Little Park Street, Coventry. Send £1 1s. deposit to the Education Office, 44 Bayley Lane, Coventry.

EASTBOURNE.—Jan. 15.—For additions to the Dispensary at the rear of the Town Hall, for the Corporation. Mr. W. C. Field, borough architect and building surveyor, Town Hall, Eastbourne.

EAST HAM.—Jan. 12.—For erection of a dining hall at Napier Road School, East Ham, for the East Ham Education Committee. Send applications and £10 deposit by Jan. 1 to Mr. R. L. Curtis, Committee's architect, 11-12 Finsbury Square, London, E.C.

ENFIELD.—Jan. 13.—For drainage and sanitary work at the Chase Farm Schools, for the Edmonton Guardians. Mr. J. C. S. Mummery, architect, 13 Fitzroy Square, W.

DURING 1913 building and constructional material to the value of £2,169,702 was imported into South Africa. This total shows an increase of over £250,000 for the previous twelve months.

THE election of the Executive Councilmen for the Amalgamated Society of Carpenters and Joiners has been completed in three districts and the result announced as follows: No. 1, S. Hunter, Manchester; No. 2, F. Wolstencroft, Royton and Shaw; No. 3, A. A. Holgate, Leeds. The result of the election of delegates for the Labour party conference is: No. 1, J. Bond, Edinburgh; No. 2, C. Hill, West Hartlepool; No. 3, M. Allonby, Salford; No. 4, A. G. Cameron, Paddington; No. 5, E. H. Jarvis, Bristol; No. 6, R. Waugh, Bristol.

THE Scarborough Corporation have applied to the Local Government Board for a Provisional Order to partially repeal, alter, or amend the Scarborough Corporation Act, 1900: To empower the Corporation to borrow, with the sanction of the Local Government Board, money for the purpose of constructing sea-water swimming and other baths, and to advance by way of loan to the Scarborough Harbour Commissioners money in addition to the £20,000 which they are authorised by Section 65 of the said Act to lend. The Corporation have also made application for sanction to borrow not exceeding £10,000 for the construction of a bathing-pool and the erection of conveniences in connection therewith in the North Bay.

AT the annual meeting of the Bradford Master Builders' Association reference was made to the great loss to the Association by the death of its late president, Councillor J. W. Sugden. The following officers were elected: President, Mr. E. Smethurst; Vice-Presidents, Messrs. E. J. Fearnley and R. H. Clark; Treasurer, Mr. W. F. Farnish. The late President, shortly before his death, invited members to forward subscriptions to the Lord Mayor of Bradford's War Relief Fund. Most of the members had already contributed in their private capacity, but, as a token of esteem and tribute of respect to the memory of the late president, several subscriptions have been received, and the treasurer was instructed to send £50 to the Lord Mayor's Fund from the Association.

LONDON MASTER BUILDERS' ASSOCIATION ANNUAL REPORT.

THE following report dealing with the work of the L.M.B.A. from February 1914 to December 1914 was presented at the recent forty-third annual general meeting of the London Master Builders' Association, an account of which appeared in our issue of December 25:—

State of the Building Trade.—During the period from the end of January 1914 until the middle of August building operations were greatly disorganised in consequence of the trade dispute.

Since the outbreak of war business has necessarily suffered to a considerable extent with respect both to work delayed by the dispute and by preventing new contracts from being entered into.

Parliamentary.—Parliamentary matters have had the careful attention of the Employers' Parliamentary Council.

Legal Cases.—Careful consideration has been given to cases in which members of the Association were interested, and in certain instances financial assistance rendered.

Condensed summaries of legal cases in which important points were raised during 1914 will be found reported in the Handbook for 1915, pp. 120-26.

Relations with the Workmen.—The negotiations with the operatives' societies, which were unsuccessful and culminated in the stoppage of work on January 24 last, referred to in the previous report, eventually led to your Association seeking the support of the National Federation, as the matter was one of national interest. Frequent meetings of all parties were held, and ultimately, at the half-yearly meeting of the National Federation, held at Cardiff in July, a resolution was carried declaring the intention to lock out members of such societies as had not come to terms on or before August 15 following.

On August 6, at a Conference with the Administrative Committee of the National Federation, held at the request of various General Executives of Unions, the terms last submitted by your Association were accepted with the understanding that four points should later be submitted to the Augmented National Conciliation Board for final decision.

It is probable that the sudden outbreak of war had some influence upon the question of settlement, but it had already been made quite clear to the various operatives' societies affected that employers in all parts of the kingdom were determined to maintain the inviolability of agreements.

The Augmented National Conciliation Board met on October 13 to consider the four points referred to it for its decision, and passed the following resolutions:—

1. *As to Disability.*—That both parties join the National Conciliation Board and come under the procedure of the Board, and until that takes place or the present agreement is terminated by due notice, the rules suggested by the L.M.B.A. remain in operation.

2. *As to Foremen.*—That Rule 1 of the General Rules agreed between the National Federation of Building Trades Employers of Great Britain and Ireland, the National Association of Master Plasterers, and the National Association of Operative Plasterers, modified to suit the respective trades, be substituted for the rule as to foremen in the existing working-rule agreements.

3. *As to Timbermen.*—That the rate for timbermen remain at 8½*d.*

4. *As to Overtime Rate for Labourers.*—That the rule as signed remain in force.

The valuable assistance of the National Federation above referred to was recognised by your Council on October 15 in the following unanimous resolution:—

"That the L.M.B.A. tender their hearty thanks to the Executive Council and officers of the National Federation for their co-operation and assistance freely rendered during the continuance of the London trade dispute, January-August 1914, whereby that dispute has now been brought to a conclusion. The L.M.B.A. desire that this appreciation shall be conveyed to the various Federations, branches, and officials."

Your Council also acknowledges the support accorded by the London Master Plasterers' Association, and notes with satisfaction the affiliation of that body to the L.M.B.A.

Frequent Conferences with the Operative Painters' Society have been held, but no agreement has been arrived at, although a rate of 9½*d.* per hour for decorators and 9*d.* for painters was offered.

Revision of Rules.—In view of the manifest importance of ensuring continuity in the conduct of affairs during the dispute, the usual procedure under Rule IV. as to election of officers and the requisite members of the Executive Council was postponed, and ultimately, on June 22, at a special general meeting, alterations were duly made to the rules in order to deal more particularly with the question of the officers. At this meeting the four officers were invited to retain their positions, to which they consented, and the new Executive Council was duly elected, the members of which will retain their seats until December 31, in accordance with the revised rule.

In future a half-yearly general meeting will be held in June each year for the purpose of the presentation of the audited accounts for the preceding year ending December 31, and of the half-yearly report of the Council.

Organisation.—The importance of reorganisation, more especially with a view to increasing the power of defending legitimate interests, has engaged, and is engaging, the attention of a special committee, which will in early course make a recommendation to the Council for consideration. It is hoped that some plan will be adopted that will have the effect of still further increasing the membership of the Association.

General.—Important Conferences have taken place with various Government and municipal bodies upon matters of great import, such as the effect of war on contracts, &c. Interviews were granted by the Treasury, Local Government Board, L.C.C., and other bodies, when the views of your Council were laid before them.

A Conference was also held with the representatives of the trade societies with whom working-rule agreements exist upon the question of working shorter hours during the period of the war, but no conclusion was reached.

The important question of a standard rate for day-work charges has received the careful attention of the Practice Committee, and it is hoped that shortly the schedule which has been approved by your Council will be adopted by the various bodies who are interested in the direction named.

The Association has sustained loss by death during the year of the following respected members—viz., Messrs. Charles Wall, Thomas Holloway, and Joseph Hill, the first-named having filled the position of President in the year 1900.

Meetings.—During the period—i.e., from February 1914 to December 31, 1914—thirty-five meetings of the Council have been held, which, with the meetings of the committees, Conciliation Boards, and Conferences, make a total of ninety-three.

Annual Dinner.—At its meeting held on November 19 the Council resolved to abandon the annual dinner owing to the war.

Gift to the Troops.—Your Council has unanimously decided to vote a sum of money for the purpose of providing some winter comforts to those who are fighting for us at the Front, amongst whom are many employees of our members.

Arrangements have been made for socks, mittens, and mufflers to be sent out at once, which will be packed separately in envelopes, which will also contain a card of good wishes from this Association, to the number of approximately 7,000 for the Army and 1,000 for the Navy, and these will be sent to London regiments, or regiments closely connected with London.

The amount to be expended upon these gifts is approximately £500, and your Council feels confident that its action will commend itself to the members generally.

MESSRS. REDPATH, BROWN & CO., LTD., held their annual meeting in Edinburgh last week. The chairman, Mr. John Cowan, congratulated the shareholders on the excellent results of trading for the twelve months which ended October 31, 1914. The report stated that, after deducting all trade charges, depreciation on plant and buildings, allowances for the realisation of the accounts, there remains a profit for the year of £49,991, to which falls to be added the balance carried forward from last year, £8,880, making a total available balance of £58,871. The directors recommended that this sum be dealt with as follows: Reserve fund (general), £20,000 (making this £60,000); 6 per cent. dividend on Preference shares, less tax, £8,729; 8 per cent. dividend on Ordinary shares, free of tax, £10,000 (of which 4 per cent. was paid as interim dividend on June 19, 1914); 8 per cent. bonus on ordinary shares, free of tax, £10,000, leaving a balance of £10,141 to be carried forward, subject to directors' fees

LONDON MASTER BUILDERS' ASSOCIATION ANNUAL REPORT.

THE following report dealing with the work of the L.M.B.A. from February 1914 to December 1914 was presented at the recent forty-third annual general meeting of the London Master Builders' Association, an account of which appeared in our issue of December 25:—

State of the Building Trade.—During the period from the end of January 1914 until the middle of August building operations were greatly disorganised in consequence of the trade dispute.

Since the outbreak of war business has necessarily suffered to a considerable extent with respect both to work delayed by the dispute and by preventing new contracts from being entered into.

Parliamentary.—Parliamentary matters have had the careful attention of the Employers' Parliamentary Council.

Legal Cases.—Careful consideration has been given to cases in which members of the Association were interested, and in certain instances financial assistance rendered.

Condensed summaries of legal cases in which important points were raised during 1914 will be found reported in the Handbook for 1915, pp. 120-26.

Relations with the Workmen.—The negotiations with the operatives' societies, which were unsuccessful and culminated in the stoppage of work on January 24 last, referred to in the previous report, eventually led to your Association seeking the support of the National Federation, as the matter was one of national interest. Frequent meetings of all parties were held, and ultimately, at the half-yearly meeting of the National Federation, held at Cardiff in July, a resolution was carried declaring the intention to lock out members of such societies as had not come to terms on or before August 15 following.

On August 6, at a Conference with the Administrative Committee of the National Federation, held at the request of various General Executives of Unions, the terms last submitted by your Association were accepted with the understanding that four points should later be submitted to the Augmented National Conciliation Board for final decision.

It is probable that the sudden outbreak of war had some influence upon the question of settlement, but it had already been made quite clear to the various operatives' societies affected that employers in all parts of the kingdom were determined to maintain the inviolability of agreements.

The Augmented National Conciliation Board met on October 13 to consider the four points referred to it for its decision, and passed the following resolutions:—

1. *As to Disability.*—That both parties join the National Conciliation Board and come under the procedure of the Board, and until that takes place or the present agreement is terminated by due notice, the rules suggested by the L.M.B.A. remain in operation.

2. *As to Foremen.*—That Rule 1 of the General Rules agreed between the National Federation of Building Trades Employers of Great Britain and Ireland, the National Association of Master Plasterers, and the National Association of Operative Plasterers, modified to suit the respective trades, be substituted for the rule as to foremen in the existing working-rule agreements.

3. *As to Timbermen.*—That the rate for timbermen remain at 8½*d.*

4. *As to Overtime Rate for Labourers.*—That the rule as signed remain in force.

The valuable assistance of the National Federation above referred to was recognised by your Council on October 15 in the following unanimous resolution:—

"That the L.M.B.A. tender their hearty thanks to the Executive Council and officers of the National Federation for their co-operation and assistance freely rendered during the continuance of the London trade dispute, January-August 1914, whereby that dispute has now been brought to a conclusion. The L.M.B.A. desire that this appreciation shall be conveyed to the various Federations, branches, and officials."

Your Council also acknowledges the support accorded by the London Master Plasterers' Association, and notes with satisfaction the affiliation of that body to the L.M.B.A.

Frequent Conferences with the Operative Painters' Society have been held, but no agreement has been arrived at, although a rate of 9½*d.* per hour for decorators and 9*d.* for painters was offered.

Revision of Rules.—In view of the manifest importance of ensuring continuity in the conduct of affairs during the dispute, the usual procedure under Rule IV. as to election of officers and the requisite members of the Executive Council was postponed, and ultimately, on June 22, at a special general meeting, alterations were duly made to the rules in order to deal more particularly with the question of the officers. At this meeting the four officers were invited to retain their positions, to which they consented, and the new Executive Council was duly elected, the members of which will retain their seats until December 31, in accordance with the revised rule.

In future a half-yearly general meeting will be held in June each year for the purpose of the presentation of the audited accounts for the preceding year ending December 31, and of the half-yearly report of the Council.

Organisation.—The importance of reorganisation, more especially with a view to increasing the power of defending legitimate interests, has engaged, and is engaging, the attention of a special committee, which will in early course make a recommendation to the Council for consideration. It is hoped that some plan will be adopted that will have the effect of still further increasing the membership of the Association.

General.—Important Conferences have taken place with various Government and municipal bodies upon matters of great import, such as the effect of war on contracts, &c. Interviews were granted by the Treasury, Local Government Board, L.C.C., and other bodies, when the views of your Council were laid before them.

A Conference was also held with the representatives of the trade societies with whom working-rule agreements exist upon the question of working shorter hours during the period of the war, but no conclusion was reached.

The important question of a standard rate for day-work charges has received the careful attention of the Practice Committee, and it is hoped that shortly the schedule which has been approved by your Council will be adopted by the various bodies who are interested in the direction named.

The Association has sustained loss by death during the year of the following respected members—viz., Messrs. Charles Wall, Thomas Holloway, and Joseph Hill, the first-named having filled the position of President in the year 1900.

Meetings.—During the period—i.e., from February 1914 to December 31, 1914—thirty-five meetings of the Council have been held, which, with the meetings of the committees, Conciliation Boards, and Conferences, make a total of ninety-three.

Annual Dinner.—At its meeting held on November 19 the Council resolved to abandon the annual dinner owing to the war.

Gift to the Troops.—Your Council has unanimously decided to vote a sum of money for the purpose of providing some winter comforts to those who are fighting for us at the Front, amongst whom are many employees of our members.

Arrangements have been made for socks, mittens, and mufflers to be sent out at once, which will be packed separately in envelopes, which will also contain a card of good wishes from this Association, to the number of approximately 7,000 for the Army and 1,000 for the Navy, and these will be sent to London regiments, or regiments closely connected with London.

The amount to be expended upon these gifts is approximately £500, and your Council feels confident that its action will commend itself to the members generally.

MESSRS. REDPATH, BROWN & CO., LTD., held their annual meeting in Edinburgh last week. The chairman, Mr. John Cowan, congratulated the shareholders on the excellent results of trading for the twelve months which ended October 31, 1914. The report stated that, after deducting all trade charges, depreciation on plant and buildings, allowances for the realisation of the accounts, there remains a profit for the year of £49,991, to which falls to be added the balance carried forward from last year, £8,880, making a total available balance of £58,871. The directors recommended that this sum be dealt with as follows: Reserve fund (general), £20,000 (making this £60,000); 6 per cent. dividend on Preference shares, less tax, £8,729; 8 per cent. dividend on Ordinary shares, free of tax, £10,000 (of which 4 per cent. was paid as interim dividend on June 19, 1914); 8 per cent. bonus on ordinary shares, free of tax, £10,000, leaving a balance of £10,141 to be carried forward, subject to directors' fees

THE LONDON ASSOCIATION OF MASTER DECORATORS.

A MEETING of the Executive Committee was held at the Secretary's office on Monday, the 14th inst.

Unemployment.—Attention was drawn to a recent circular sent to the Press on the question of finding work during the present crisis, and the Secretary was instructed to thank Mr. Jennings for the assistance he had rendered in connection with same.

Conciliation Board.—The Secretary reported that the Conciliation Board had had several meetings in connection with the dispute that had arisen between Messrs. Green & Abbott and their employees, and that as the Men's Union had not accepted the finding of the Board, the services of the Board of Trade Conciliator had been called in. The Conciliator presided at a meeting of the Board held on November 26, 1914, and gave his award in the following terms:—

IN THE MATTER OF A DISPUTE BETWEEN MESSRS. GREEN & ABBOTT AND THEIR EMPLOYEES.

Having been duly appointed by the Board of Trade to act as Conciliator for the adjustment and decision of a dispute between Messrs. Green & Abbott and one of their workmen under the provision of the working rules for the regulation of disputes between the London Association of Master Decorators and the National Amalgamated Society of Operative House and Ship Painters and Decorators awarded by the late Mr. Benjamin Francis Williams under date October 2, 1913, I duly attended a meeting of the Conciliation Board at 5 Old Palace Yard, and having been informed that the nature of the dispute was whether by offering a workman who had been receiving 10*d.* per hour 9½*d.* per hour upon his starting a fresh job, Messrs. Green & Abbott had committed a breach of the working rules which justified the Society in withdrawing their workmen in the employ of the said firm. And having ascertained that the Conciliation Board were unable to agree and had duly applied to the Board of Trade for the appointment of a person to act as Conciliator, I now decide and award that the said firm, Messrs. Green & Abbott, have not committed a breach of the working rules, and that the said Society are not justified in withdrawing their workmen.

(Signed) F. A. GREER.

November 26, 1914.

The award removes any doubt as to the interpretation of the working rules as to rate of pay.

PATENT SPECIFICATIONS PUBLISHED DECEMBER 24, 1914.

Selected by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

No. 24,417. Oct. 28, 1913.—L. S. Bache, Bound Brook, Somerset, New Jersey, U.S.A. Treatment of wood or like fibrous material.

27,758. Dec. 2, 1913.—F. J. Rodgers, 159 Clive Road, West Dulwich. Apparatus for delivering disinfectant to flushing tanks and other like containers.

27,935. Dec. 4, 1913.—F. D. Currie, The Grammar School, Southport. Attachment for penholders, pencils, paint brushes, fountain pens, and the like.

27,982. Dec. 5, 1913.—Douglas Allport and Douglas Allport, junr., 106 Queen Victoria Street, E.C. Construction for sliding doors or partitions.

27,984. Dec. 5, 1913.—Henry Rottenburg, 13 Madingley Road, Cambridge. Window opening and closing apparatus.

28,038. Dec. 5, 1913.—J. C. Treen, South Metropolitan Gas Co., 709 Old Kent Road, S.E. Pre-payment gas meters.

29,316. Dec. 19, 1913.—W. G. Kent, 199 High Holborn, W.C., and E. W. Hovenden, 4 Shaftesbury Avenue, Bedford. Fluid meters and also those for adding reagents to fluids.

251. Jan. 5, 1914.—Birt Victor, Pascagoula, Jackson, Mississippi, U.S. Concrete sheet piles.

4,546. Feb. 21, 1914.—R. G. Carlson, R.I., Box 6, Huntley, Harlan, Nabraska, U.S.A. Door locks.

5,059. Feb. 26, 1914.—A. N. Fancher, 320 Fifth Avenue, N.W. Faribault, Rice, Minnesota. Door checking device and combined door closing and checking device.

5,080. Feb. 27, 1914.—J. B. Broadhead, Woodhouse Works, Brighouse. Self-acting air escape valves.

6,468. March 14, 1914.—Richmond Gas Stove and Meter Co., Ltd., and S. F. Jones, Academy Street, Warrington. Gas grilling apparatus.

9,083. April 9, 1914.—J. D. Hope, 55 Lionel Street, Birmingham. Casements.

Any of the above specifications may be obtained from J. D. Roots & Co.

VARIETIES.

MR. WILLIAM ROBERT GALBRAITH, of Finchley Road, South Hampstead, civil engineer, who died on October 5, aged eighty-six, left £88,879 gross.

MR. WILLIAM NEWTON DUNN, F.R.I.B.A., died at Reigate on December 23 in his sixty-seventh year. Mr. Dunn became an Associate of the Institute in 1882.

LARGE extensions to the Pall Mall Depositories are being carried out at Barlby Road, North Kensington, under the supervision of Mr. William G. Hunt, F.R.I.B.A. The general contractors are Messrs. William F. Blay, Ltd., Railway House, Dowgate Hill, E.C., and at Dartford, Kent.

THE Coventry City Council, at their meeting on Tuesday last, approved of various schemes, including the following: The erection of a school in Folly Lane, provision of a pavilion in Spencer Park (£1,100), and the erection of eighteen houses for tramway men near Priestley's Bridge. The Coventry Guardians have accepted plans for alterations at Plemont Villa, Whitley, which are estimated to cost £1,200.

THE Weardale and Consett Water Co. have deposited a Bill in Parliament for some important constructive work. It is proposed to lay a pipe twenty-seven miles long and of three sizes from the Burnhope Burn to Wheatley Hill. A reservoir for impounding eight million gallons will be built at the former place. The cost of the scheme is estimated by the chief engineer, Mr. Robert Askwith, at £650,000.

THE death took place last week, after a long illness, of Mr. Frank Sumner, M.I.C.E., engineer to the City of London Corporation. Mr. Sumner was formerly borough engineer and surveyor of Woolwich and Bermondsey. Since he entered the service of the City Corporation in 1905, in succession to Mr. D. J. Ross, he had carried out many important improvements, notably in connection with the Guildhall, the construction of new subways, and in street lighting.

THE Woking Education Committee have been informed by the Surrey Education Committee that tenders would be invited for the erection of new buildings at the Goldsworth, Horsell (Infants'), Knaphill, and Maybury Council Schools, as soon as the consent of the Local Government Board to the necessary loans had been received. It was decided to recommend that the following five local firms be asked to send in estimates: Mr. F. Aylott, Messrs. Drowley & Bridger, Messrs. J. Harris & Son, Messrs. H. Ingram & Son, Mr. S. Silk.

MR. SAMUEL HENRY DIBBLE, of 30 Ledsam Street and of 154 Ladywood Road, Birmingham, builder, has left estate valued at £203,046, of which the net personalty is sworn at £54,589. Mr. Frank Piper, of 129 Gillott Road, Birmingham, builder's clerk; Mr. John Burton Buttery, of 7 Talbot Road; Smethwick, builder's clerk; and Mr. Walter Fry, of 57 Wigorn Road, Warley, builder's clerk, are three of the executors. To each of them £50 is left if still in his employ. The duty payable on the estate will amount to about £6,000.

AT the last meeting of the Sunderland Education Committee, it was reported that the Board of Education had approved the plans of the proposed secondary school for boys on the Barnes estate, subject to amendments in matters of detail. The original estimate was £37,189, and with a view to covering the cost and the requirements of the Board of Education, and meeting any increase of prices arising in consequence of the war, the architects had prepared an amended estimate of the cost, making it £40,112. The Council will be asked to proceed with the building of the school.

"PATRIOTIC War Songs and Poems" (London: Spottiswoode & Co., Ltd., price 4*d.*) is a compilation in booklet form of some thirty-five pieces deemed specially suitable for "fleet, camp, and country." Almost all the selections are well known, if not actual classics, and breathe the high patriotism of our forbears from Shakespeare to Tennyson. Living poets are lightly drawn upon, and no room is found for "Tipperary." Yet it would be interesting to know how many of our fighting men would care to hear "The Charge of the Light Brigade" or the "Highland Boat Song" in preference to that astonishing ditty. Those who do so will find the booklet full of good things. Any profits from the sale will be given to some War Fund.

FORTHCOMING EVENTS.

Monday, January 11.

Surveyors' Institution: Adjourned Discussion on the Papers delivered by Mr. Andrew Young (Member of Council) and Mr. L. O. Mathews (Fellow) on "The Report of the Land Enquiry Committee on the Acquisition of Land," to be reopened by Mr. Howard Martin (Past-President), at 8 P.M.

Royal Academy: Lectures on Painting (1) "The Mental Outlook in Painting," by Mr. H. H. La Thangue, R.A., at 4 P.M.

Tuesday, January 12.

Institution of Civil Engineers: Paper entitled "The Lateral Pressure and Resistance of Clay, and the Supporting Power of Clay Foundations," by Mr. A. L. Bell, B.A., B.E., M.I.C.E., at 8 P.M.

Wednesday, January 13.

Royal Academy: Lectures on Painting (2) "Colour in Painting," by Mr. H. H. La Thangue, R.A., at 4 P.M.

Peasant Arts Fellowship: Paper entitled "Rheims and Gothic Reconstruction," by Mrs. J. King, at University of London Club, Gower Street, at 8 P.M.

Thursday, January 14.

Society of Architects: Annual General Meeting, at 7.30 P.M.

SOME WORK OF THOMAS H. MAWSON.

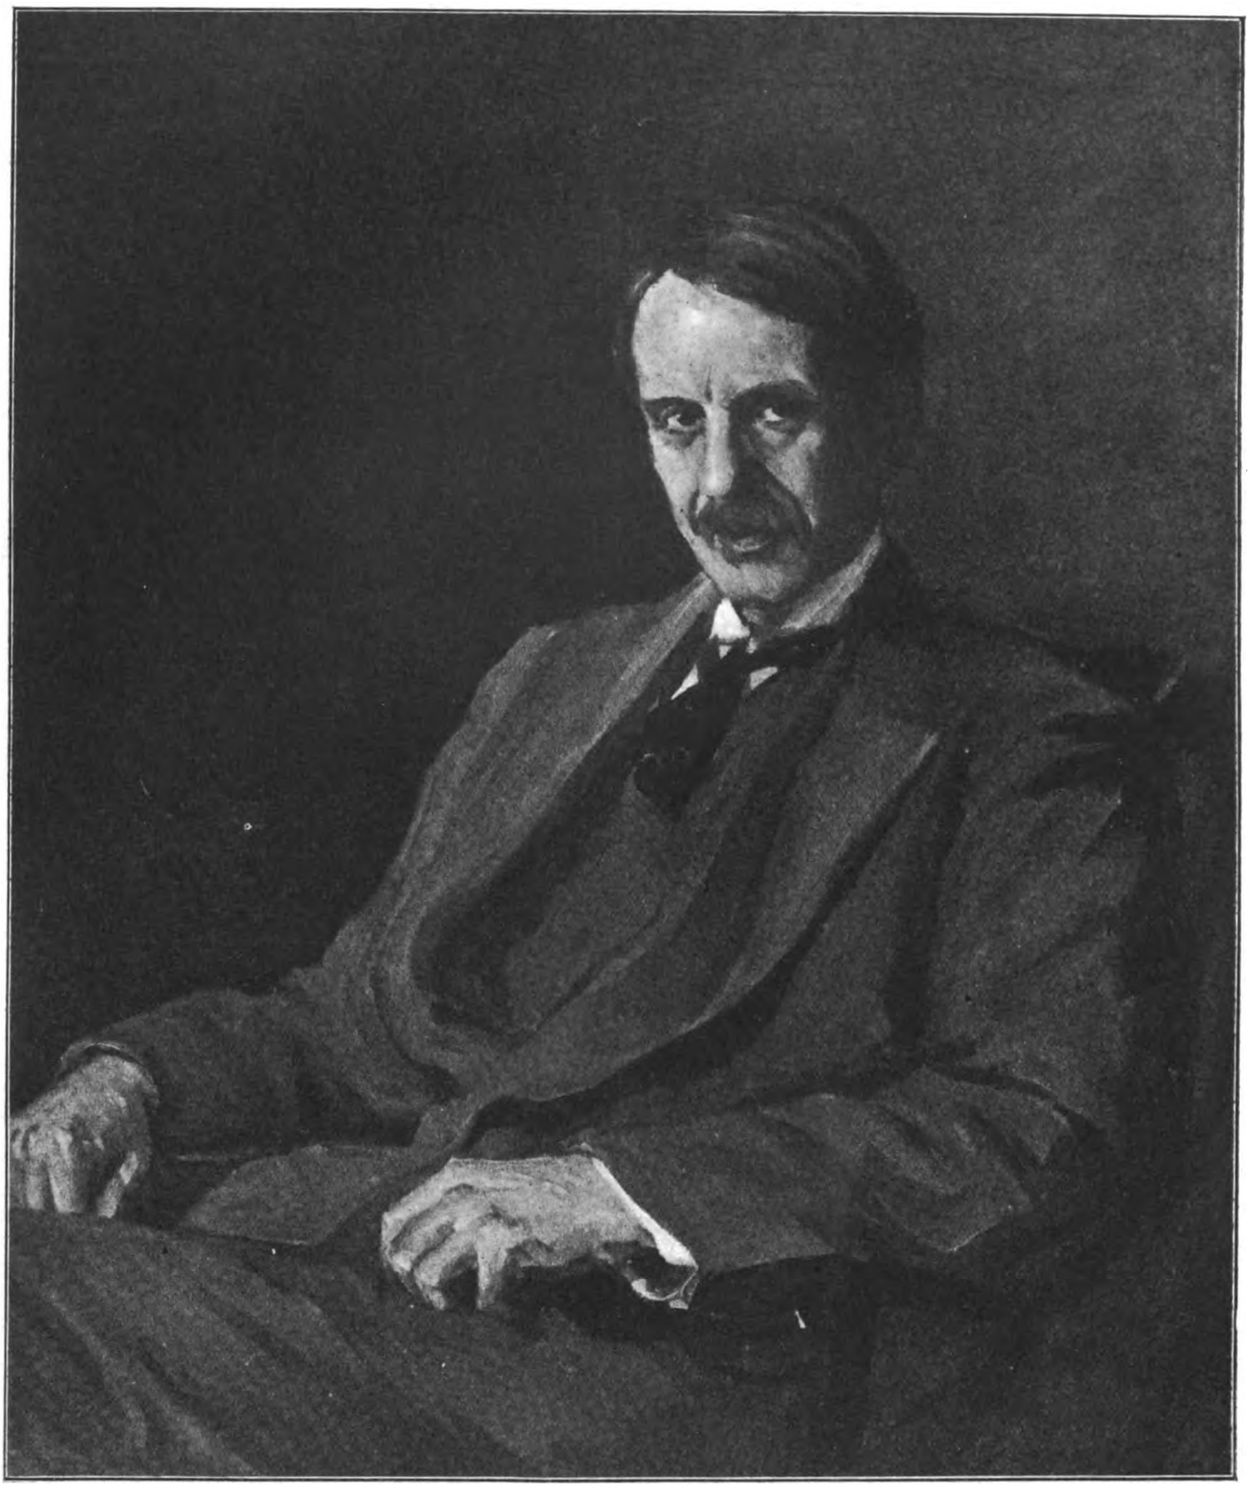
FROM garden planning to town planning is but a step in development, and hence it is not surprising to find that Mr. Thomas H. Mawson, whose many works in garden design are to be found not only in our own country but across the seas, should, in these days when town planning has caught the public fancy, have turned his attention to the problem of the day.

Hence we may pleasurably if not profitably give consideration to a couple of his latest efforts in this direction. Although we speak of the work of Mr. Thomas H. Mawson, we are bound to recognise that the two schemes with which we are now dealing are put forward as the work of the firm of Thomas H. Mawson & Sons, included in which is the name of Mr. E. Prentice Mawson, prominently before the architectural public in a recent Soane Medallion competition.

Our first purview shall be directed to the scheme for remodelling the city of Exeter, the bird's-eye view for the new municipal centre of which was hung in last year's Royal Academy Exhibition and is reproduced by us to-day as one of our inset illustrations. In dealing with Exeter as a subject for town planning, the designer has of course an ancient city in his hands, a city which at one time was surrounded by walls of defence, hence possessing the almost invariable characteristics of such towns, the plans of which are dominated by their ancient walls and the gates in the walls. As usual the original main streets of Exeter are through streets running from gate to gate, and following naturally along the lines which the traffic would inevitably follow. As in the case of most walled towns, Exeter has its share of narrow streets and congested areas.

Exeter has already one entirely modern business street, Queen Street, which as such, says Mr. Mawson in his report, has not been an entire success and has never entered into serious competition with the ancient thoroughfare, which is known in its various lengths as Fore Street, High Street, and Sidwell Street. The failure of Queen Street as a business centre Mr. Mawson attributes to the fact that it is a more or less arbitrary creation rising out of the accidental placing of the modern stations, and, of course, especially Queen Street Station, and from the point of view of the town planner it possesses many of the properties of a cul-de-sac at its south-eastern end, and thus fails from the traffic standpoint, notwithstanding the fact that at its other end it falls very well into its place as a part of a well-marked radial system.

A further reason given for the lack of success in Queen Street arises from the fact that it has been treated too much as an isolated unit in the city plan, instead of being a part of a connected scheme for the improvement of the city as a whole. Thus it is a monument to the futility of disconnected effort, of tackling problems piecemeal, and of narrowness of outlook both in regard to its wider influences and its continuity through future ages.



Mr. Mawson's main proposition is to throw up all attempt to make Queen Street a busy shopping street and to create instead a great municipal, literary, artistic, and educational centre. The college, museum, library, and art school are already there, and it is proposed to arrange a symmetrical group of civic buildings of which the centre will be occupied by a block containing the municipal offices and city hall, flanked on one side by a separate block containing a new library and records office, and on the other by a corresponding building which may serve as an art gallery, museum, or assembly hall.

Another vital element of Mr. Mawson's scheme is the construction of a new railway station in place of the existing Queen Street Station. This new station, it is proposed, should be planned on up-to-date American lines, with a "concourse" booking office and approaches at the level of Queen Street and above the platforms, which are to be reached by stairways. Naturally the new station is to have an imposing architectural elevation towards Queen Street.

To carry out such a scheme as that proposed, drastic clearance is required in the existing arrangement of the city, and it is contemplated by its author that a considerable time will be necessary for its completion. He justifies this anticipation by saying that "The Cathedral took three hundred years or more to build, so if the fresh task is to form a proper adjunct to it it too must be a work the magnitude of which will necessitate a sustained effort over a very long period, and the steady pursuit of a settled policy for its ultimate fulfilment."

Included in the drastic clearance proposed is the sweeping away of one of Exeter's public markets, the old church of St. Pancras, and "another place of worship of little architectural merit." The proposed removal of these will no doubt raise strenuous opposition to the scheme, but to us the interesting point in our study of Mr. Mawson's methods as a town-planner is the indication that in order to obtain what he considers a desirable result he is prepared to be ruthless in destruction and to conceive his schemes in a large and broad view, looking forward to even a distant future for their complete realisation. Herein we recognise the mind of the garden architect, who, particularly when he intends planning on formal lines, must often be ruthless

Digitized by Google

MR. THOMAS H. MAWSON, FROM PORTRAIT BY SIR HUBERT VON HERKOMER, R.A.

in alteration and even destruction, and must always have before his mental vision the future rather than the present effect of his lay-out and planting.

We may now direct our attention to quite a different problem, as tackled by Mr. Mawson and his sons. "Borden Park, Ottawa's premier residential and recreational suburb,' in the somewhat flamboyant nomenclature of the descriptive report. This is a building estate of some 750 acres on the shores of Lake Deschênes, some distance from Ottawa, which it is proposed to develop as a residential sub-town, connected to the capital by an electric railway. Argument in favour of the estate's position is based on a comparison between the modern great cities of the New World and the country towns of the Old World; and no doubt Ottawa is, or will be, sufficiently large to support a residential sub-town—rather than suburb—at a considerable distance from its centre.

Let us see how Mr. Mawson develops his building estate. As a town, although a sub-town, it has its business centre, its quasi-civic centre, its recreational centres, and its factory district, so that within its 750 acres is the complete urban constitution on a small scale. Being intended as a "recreational suburb," we naturally find considerable importance allotted to the chief recreational centre.

The estate is bisected, or at least divided into two approximately equal halves, by the street railway, which runs in a serpentine line from Ottawa to other districts beyond the estate. Normal to this and crossing it Mr. Mawson places his principal axial line, on which are the hotel, nearest the lake shore, the business centre, and the quasi-civic centre. A secondary axial line, approximately parallel to the principal, dominates the chief recreational centre, on which are an artificial boating harbour or lagoon, the county club, and a nine-hole

Digitized by Google

golf course. In the main traffic lines of the town we note the penchant of the garden architect for sinuous curves, which, intersected by short straight streets, leads to a result intended by the author to give variety to the shapes and sizes of the various building plots. It also leads to the development of awkward pieces of back land, which it is suggested may be "suitable for small industries, such as bake-houses, garages, stables, smithies, &c., in centres of building plots." Whether this development and use are desirable features of "Ottawa's premier residential suburb" is a question to which experienced estate surveyors may not always be found ready to give an affirmative answer. It is true that the suggestion is made that they should be hidden "behind trees and behind the houses"—but town houses usually have windows at the back as well as in front.

The study of actual work by those esteemed as experts must be fascinating and interesting to all those who may hope to follow in any profession; but we must warn any aspirants who turn their attention to the reports of Thomas Mawson and Sons that a very vital consideration is omitted, that of expenditure and profit or return.

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.

THE study of old furniture is a quite useful one for architectural students in moderation, for old furniture was frequently designed, if not by architects, at least by those who designed details of architecture, and the line of demarcation between fitments and furniture is certainly elastic. Moreover, the architect should, and not infrequently does, even now-a-days, design the furniture as well as the fitments of the buildings erected from his designs.

"Improver" has selected a "Chippendale armchair—1760" for his subject, which, whatever may be the authenticity of its pedigree, carries evidence of the characteristics of the master, and is withal an excellent piece of design and construction. One must not necessarily assume that all work bearing these characteristics actually was produced in the master's workshop, for the term "Chippendale" furniture is rather generic than personal. "Improver's" drawing is well executed and thorough.

"Rambler" has found his subject in a seventeenth-century "Welsh cupboard," clearly the work of a craftsman in the vernacular manner of his day, with a curious admixture of Classic and Gothic motifs. "Rambler" should, in his drawing, have taken more account of the construction of his subject, and particularly of the jointing, which, as the piece is in well-marked oak, would be easily decipherable. We have not even an indication of the method of mitreing, whether joiner's or mason's, which at the particular date of the example is of importance.

An Italian folding armchair of carved oak, of the approximate date 1550, has been chosen by "Harley," a highly interesting example of a not uncommon type, on somewhat similar lines to the so-called "Glastonbury" chair. "Harley" at present lacks experience in draughtsmanship, but, of even greater moment, has devoted too little attention to the construction of the specimen he has drawn.

"Owain" has measured and drawn a seventeenth-century oak cupboard from the Victoria and Albert Museum, an excellent example of Jacobean furniture. "Owain's" drawing is commendably workmanlike, and shows construction, but a perspective sketch is missing.

Mr. B. Fraser has also fixed upon a Jacobean piece for his subject, "an oak buffet from the Rows, Watergate Street, Chester." This, too, is excellent and particularly interesting from the use of inlay as decoration to the panels and other parts where ordinarily at this date carving would be found.

We award prizes of one guinea each to "Improver" and Mr. B. Fraser.

NOTES AND COMMENTS.

THE interior of Bentley's masterly cathedral at Westminster will shortly advance a further stage towards completion by the opening of the chapel of St. Andrew. The work of the Sicilian craftsmen who have been so long engaged on it is one of the richest examples of mosaic and marble inlay in the metropolis. There are twelve chapels in the cathedral, and St. Andrew's is the third that has been completed. Both in natural and in artificial light the chapel, with its groundwork of gold, has a most brilliant appearance. Handsome grilles with gates of bronze gilt separate the chapel from the south aisle. The marble pavement representing the sea has inlaid fishes of coloured stone. The canopy of the altar is white marble on pillars of verde antique, with bronze bases and capitals. The altar mensa is of black Alloa granite supported on five pillars of red Peterhead granite, with bronze capitals and bases of Aberdeen granite. The reredos is of marble with sculptured bands and a cross inlaid of antique Egyptian porphyry, and upon this is a large bronze figure of Christ. The dado of the south walls consists of Hymettian marble, blue and white, the colours of Scotland and of St. Andrew. Over each window there is a spandril with a sculptured angel supporting an enamelled shield with the arms of the noble donor. In the arch of the east wall is a large jewelled St. Andrew cross on a flowery field with peacocks and flying white doves. The groundwork of the vaulting is of gold mosaic, and on each side are representations of six cities connected with the Apostle—Patras, Amalfi, Constantinople, Bethsaida (his birthplace), Milan and St. Andrews.

The Shropshire Historical Antiquities Association, founded in 1912, has just issued its first report.

The report states that the Association has aimed not at undertaking the repair or preservation of buildings of architectural or historic interest, but at acting as a sort of central agency for receiving information about such monuments when they seem to be threatened. The committee had had a large number of cases brought to its notice, and was pleased to report that in most cases those to whom belonged the custody of the monuments in question had welcomed the advice and assistance of the Association. In regard to Lloyd's mansion in the Square at Shrewsbury, dated 1540, which was threatened with demolition, and the chapter-house of Buildwas Abbey, part of which was insecure, the Association had been working in conjunction with the Society for the Protection of Ancient Buildings. In regard to two very important monuments which had suffered much from neglect, Langley Chapel and Mitchell's Fold, a sort of Druidic circle in the hills near Corndon, the former had been put in the custody of the Board of Works as an historical monument, and the owner's permission had been obtained for similar action in regard to the latter.

At Ludlow the carrying out of repairs to certain houses revealed the fact that they contained good timber work. Under the advice of the Association the houses had now been restored more or less to their original form, and the beauty of two of the Ludlow streets had been materially enhanced.

Other matters dealt with by the Association had relation to the Tong Cup, a faculty for the alienation of which was refused by the Chancellor; the Shrewsbury town wall bastion; the Upton Cressett gate-house; Ireland's mansion, Shrewsbury; Lilleshall Abbey; Haughmond Abbey; Stokesay Castle; Craven Arms, where precautions were taken against suffragettes; Clun Bridge, and other historic buildings.

The opposition naturally aroused in many towns by the intention of their corporations to undertake the supply not only of electricity, but of electrical fittings, has arisen also in Edinburgh, where the members of the electrical trade have sent to the members of the Corporation a

Digitized by Google

representation against the clause in the proposed Provisional Order for the city, at present under the consideration of the Council, by which the latter proposes to apply for special powers to supply or hire all electrical apparatus, except lighting apparatus, to fit up same, to open showrooms or shops throughout the city for this purpose, and to use public money for the advertisement and promotion of the scheme. The representation is signed by nearly one hundred firms in the trade, and also by thirty-five other firms on behalf of the members of the Edinburgh, Leith, and District Ironmongers' Association. The representation reminds the Council that a somewhat similar proposal was before it only two years ago, in connection with the Provisional Order of 1913, when it was defeated by a large majority in the Council. It adds that even although the proposal had not been discussed so recently the present national crisis is not a suitable time for its introduction; it is, comparatively speaking, a question of minor importance to the Corporation, but of prime importance to one of the industries of the city, which has already been badly hit owing to the number of men away on service and the compulsory restriction of lighting within the city area, with the consequent loss of remunerative trade to the traders. It is also urged that since the last proposal was before the Council the traders have offered to consult and co-operate with the Corporation department in every way in their power with a view to extending the uses of electricity in the city, but that offer has not been accepted; that no private industry can live against rate-aided competition, as it is not fair trade; that the supply of electrical appliances, unlike the supply of electrical energy, is not a monopoly, and consequently is not a suitable field for municipal activity; that Edinburgh is already extremely well provided with electrical showrooms in all parts of the city by the private trader; that the proposals would be no advantage to the Corporation or the general body of the ratepayers, and would do incalculable damage to an industry of the city which employs a large number of workers, occupies business premises of considerable rating value, and in which a considerable number of ratepayers have sunk their capital.

We learn from the *Western Morning News* that the Museum and Art Gallery Committee of the Plymouth Corporation have recently acquired, from two independent sources, a number of fine water-colour drawings by John Foulston, a London architect, who, between 1810 and 1840, carried out a great deal of work in the West of England. In 1838 he published a book detailing the designs he had there carried out. Mr. Foulston seems to have paid much attention to Plymouth. If the city fathers of that period were deterred from carrying out all his schemes on the ground of expense, it might have been happier if their successors had kept his designs before them.

His most important works now existing are the Royal Hotel and Theatre and the Athenæum. With the former building, and the erection of St. Andrew's Chapel, better known now as St. Catherine's Church, Lockyer Street was associated. It would have made a really handsome thoroughfare had the design been carried out in its entirety. But the patchwork jobs of the independent builder intervened, and marred what might have been a fine scheme. St. Andrew's Church was restored by Foulston, and an interesting feature was the old three-decker pulpit. This was swept away during later restorations. The same type of pulpit was in St. Andrew's Chapel. The Proprietary or Cottonian Library, in Cornwall Street, was also designed by Foulston, but his frontage there was pulled down in 1853 during the enlargement of the building. The Exchange, in Woolster Street, was never built as designed, probably for reasons not unconnected with expense. Water-colour drawings of the above buildings are contained in the collection.

Among the designs not carried out, and which would have improved Plymouth far beyond its present claim to be a well-laid-out town, was the Esplanade on the Hoe. The present pile is a cheaper modification of the architect's design, but Elliot Terrace and the other buildings should have been occupied by a fine range of houses of which two drawings are on view.

The public baths question has of late years been many times discussed, and its only result up to the present is a very fourth-rate establishment in a back street. Foulston's drawings show that he had the matter in hand nearly a hundred years ago, and designed a very handsome building for the Hoe. Another sore point of recent times has been the condition of Princess Square, but Foulston's scheme if carried out would have settled this vexed question, as his drawing shows a handsome structure modelled after the monument of Lysicrates at Athens, a design not impossible to carry out even now. Other delightful drawings show an extremely handsome Armada Arcade and a covered way which might be part of a winter garden, but in what connection these buildings were designed is doubtful. Other drawings refer to libraries in Tavistock and Torquay, together with a country seat which has not yet been identified.

The collection is in a perfect state of preservation, and the Art Gallery Committee are to be congratulated on securing such a "prize" of architectural interest, giving a suggestion of what Plymouth might have been.

Very wisely, before actual construction, a model has been made of the proposed memorial at Holyrood, which has excited so much controversy at Edinburgh, and disagreement, we might say, between that city and Glasgow. The model is intended to make trial of the effect which will be produced at the Palace by the erection of the statue of King Edward VII., which forms part of the national memorial. One part of that memorial will consist of handsome wrought-iron gates to enclose the forecourt on its north and south sides. The more personal part will take the form of a statue of the late King, which is to be erected on a site at the foot of the Canongate, on the left hand side of the street, and looking across to the older half of the Palace. From plans by Mr. Washington Browne, R.S.A., the architect of the memorial, Mr. Colin M'Andrew, builder, has prepared on this site, in wood and grey canvas, an interesting representation of the manner in which it is proposed the site should be treated for the reception of the statue. The length of the plot of ground affected is 90 feet, and it has a width of 35 feet. The latter practically represents the breadth of the platform, approached by a series of steps, on which the statue will be placed. For background immediately behind the statue is a semi-circular wall, 17 feet 6 inches in height, with moulded top. The walls on each side are 12 feet in height. The ends of the platform are closed by a low wall surmounted by railings—with columns at the opening and angles. The opening between the columns on the front of the platform is 60 feet. The south angle column at the Canongate is about 18 feet in height. At the corresponding angle at the north end is a similar column between which and a massive pier on one side of the roadway—a representation of one of the piers which will carry the gate—is a railing about 13 feet in height, representing the footway gate into the forecourt. This pier is about 30 feet high. Its base measures some 12 feet by 7 feet; the faces on the north and south sides are ornamented by twin pilasters, and there is a massive cornice and finial. The pedestal of the statue, which is well set back on the platform already alluded to, will have a representation of the figure placed upon it to-day so that the full effect thereby may be secured. When all is in order, the Principal Architect of the Board of Works, London, will, it is understood, come to Edinburgh and report on the subject to Their Majesties, who continue to take in the details of the memorial the greatest interest.

OUR good friends of *The Sanitary Record and Municipal Engineering* have a gibe at the criticism by architects of building by-laws, affirming that architects "desire to be unfettered by rules and regulations." In this our contemporary errs. The main ground of objection by architects to existing by-laws is that, whilst the criticism of municipal surveyors as stated by our friends "is in general upon the inadequacy of the by-laws to prevent the use of improper materials or their insufficiency to ensure hygienically constructed dwellings," is a quite correct criticism, the by-laws cause unnecessary expense and prevent the building, in rural districts especially, of houses for which the tenants can afford to pay an economic rent.

The Municipal Art League of Chicago, an account of whose latest activities we give elsewhere from the *Christian Science Monitor*, of Boston, U.S.A., is obviously doing good work that may worthily set an example to many of our provincial cities and towns.

WAR ITEMS.

THIS is the first great war in which field motor-ambulances have been extensively used. It was inevitable that many defects should be found in existing types, and in various quarters experts began to ask whether something could not be done to standardise the patterns and to improve the type. At the instance of Mr. Henry S. Wellcome, the founder of the Wellcome Bureau of Scientific Research, a Commission has been formed, and the names of members show at once that the matter is regarded as of first importance by those most intimately connected with the welfare of the wounded soldier.

Sir Frederick Treves, whose long experience and distinguished service specially fit him for the task, has consented to be the chairman. The Admiralty is represented by the Director-General of the Medical Department, R.N., while the Quartermaster-General to the Forces and the Acting Director-General, Army Medical Service, represent the War Office. The British Red Cross Society is, of course, represented by Sir Frederick Treves, and the St. John Ambulance Association by Sir Claude Macdonald and Sir John Furley. The remaining members are all experts. This Commission will first and foremost act as a judging committee for the award of prizes of the value of £2,000, provided by the Wellcome Bureau of Scientific Research. These prizes are offered for the best designs of an ambulance-body which shall fit a standard pattern motor-chassis for field motor-ambulances. The last day for the receipt of competing designs is June 30, 1915. It is hoped that the competition will bring in a number of ingenious designs from which the ideal field ambulance-body will be evolved.

It may be asked why the competition is restricted to designs for a body and not for the complete ambulance, including a chassis. The reason is that a chassis takes much longer to build than a body, and that, when war breaks out, it is impossible to get at short notice anything like a sufficient number of any one type of chassis. On the other hand, a standardised body to fit any chassis of approved dimensions can be constructed in numbers at comparatively short notice. And a perfected body is badly wanted to ensure complete comfort for the wounded.

It is hoped that the information obtained by the competition, and in other ways, will be published in some permanent form, available for future reference. Probably in addition to one design of special excellence, there will be submitted various ingenious suggestions which may be incorporated in the pattern design approved by the Commission. For these a portion of the prize-money has been set apart. The first prize is of one thousand pounds, the second of five hundred, and the third of three hundred pounds. All details of conditions may be obtained from the Secretary, The Ambulance Construction Commission, 10 Henrietta Street, Cavendish Square, London, W. The competition is open to citizens of all nations.

[Now that there is a slump in architectural ones, this competition for a hospital on wheels may interest some of our readers.—ED.]

A well-attended meeting of the members of the Liverpool Architectural Society was held for the purpose of presenting their President, Mr. G. W. Fraser, now a lieutenant in the 1st Battalion K.L.R., with a sword in recognition of his valuable services to the Society as secretary for many years and as their present president.

Mr. W. E. Willink, in a few well-chosen words, spoke in a happy mood of the great popularity of Mr. Fraser, as instanced by the warm response to the appeal for subscriptions to the presentation sword, and spoke of his patriotic conduct in responding to the call of his country to serve the colours.

Mr. Fraser briefly replied, and thanked all his architectural comrades for their good wishes, and expressed his extreme gratification at the presentation, and said that he would feel upheld by the knowledge that he had the universal approbation of the Liverpool Architectural Society in whatever capacity he might be called upon to act.

Sergeant-Major Draycott, of the 1st City of London Sanitary Company (Territorial), writes:—

I have to thank you for so kindly giving publicity to our previous appeals for recruits for the above Company. The results of that appeal have been, up to the present, quite satisfactory, but more men are wanted, and still more men.

The duties of the men of the Company are: To select sites for camps and bivouacs; to ensure that these are healthy and can be properly drained; to see that a good water supply is provided, and to examine and, if necessary, purify the water; to see to the location of latrines and ablution places, and the speedy removal of all solid and liquid refuse from the camps, and to act generally as health superintendents, and limit by their agency the outbreaks of preventable diseases, such as typhoid fever and dysentery, which in most campaigns have caused an excessive number of deaths.

One section of the Company has been at the Front for some time, and has so proved its value with the troops and in enforcing sanitation at base camps, at towns where troops are billeted, and at important railway stations, that the War Department has decided to attach a Sanitary Service Section to every division of the Army.

Several such sections, each consisting of an officer, a staff-sergeant, a sergeant, two corporals, a lance-corporal and twenty men, recently left for duty with the Expeditionary Force, and further sections are being formed immediately.

All recruits must be prepared to sign on for Imperial Service, and men from municipal engineers', architects', and public health offices, and from similar private offices, who possess satisfactory sanitary qualifications, are given preference in the selection for promotion to N.C.O. rank.

The age limit is 19 to 38, height 5 feet 3 inches and upwards, chest 34 inches and upwards, and the usual medical examination is made.

The rates of pay are: Staff-Sergeant, 4*s.* 5*d.*; Sergeant, 3*s.* 10*d.*; Corporal, 2*s.* 11*d.*; and Private, 1*s.* 10*d.* per day, and separation allowance in addition.

Intending recruits should apply personally to the 1st City of London Sanitary Company, Room B.6, Duke of York's Headquarters (Turk's Row Entrance), Chelsea, S.W., but persons living in the provinces should obtain and forward to headquarters a certificate of fitness from their own medical man. They will then be advised when to attend for enlistment, and a free travelling warrant to London will be issued to them.

UNIVERSITY EXTENSION LECTURES IN MUSEUMS.

IT is satisfactory to find that the interest shown in Mr. Banister Fletcher's lectures on architecture, in spite of unprecedented war conditions, has justified arrangements to continue these courses this term. They are the only courses of University Extension lectures now being given in the museums, and are further, from the nature of their subjects, of special interest at the present time, when so many architectural monuments have become prominent through the ruthlessness of the enemy's system of warfare.

The course at the British Museum began on Thursday, January 7, at 4.30, and is on Roman Architecture, which is a subject of perennial interest both on account of the unfading fascination of Ancient Rome and because it is the basis of all later styles.

At the Victoria and Albert Museum the course begins on Monday, January 11, at 4.30, with nine lectures on English Gothic; while there are special lectures on Westminster Abbey, our national Walhalla, and on the Tower of London, which has been by turns fortress, palace, law courts, prison and arsenal, and has always kept abreast of the needs of the times. Cathedrals, town and trade halls of Belgium, the martyr country of to-day, will also be described. Full particulars may be had from the Hon. Secretary, 10 Woburn Square, W.C.

COMPETITION NEWS.

BURNLEY.—Competitive plans for the extension of the Burnley Victoria Hospital have been sent in by ten selected architects, and it is expected that the assessor will make his award at an early date. The proposed enlargement will accommodate about fifty beds, and a new operating theatre and a nurses' home will be provided.

ILLUSTRATIONS.

CITY OF EXETER: PROPOSED IMPROVEMENTS.

OUR reproduction of the drawing which appeared in last year's Royal Academy Exhibition is referred to in our article on the work of Thomas H. Mawson.

SKETCHES AT KING'S LYNN BY MR. WALTER GANDY.

THE author writes: To King's Lynn I went mainly in order to study the delightful little Custom House, a building of 1683, attributed by some to Wren, but according to Mr. Beloe, the munificent local antiquary, its authorship is claimed by Henry Bell, an architect who was twice Mayor and died in 1717. A good view of the building can be had from a wharf on the opposite bank of the Purfleet, but stacks of timber were occupying the best positions, and the tide was inconveniently out just when the light was right, so I gave up the attempt to make a drawing. With its two magnificent churches, the Guildhall, the Red Mount Chapel in the Walks, the Greyfriars Tower, the old inn called the Greenland Fishery—bought, restored, and opened as a museum by Mr. Beloe—many fine houses of the seventeenth and eighteenth centuries, and railways, north, south, east and west, to the Marshland villages, the healthful cliffs of Hunstanton, the Sandringham domains, or Ely city, it is evident that King's Lynn is a capital centre for a varied holiday.

Within a short distance of each other there may be seen the doorways represented in my sketches. Thoresby's College, built by Thomas Thoresby, Mayor in 1502, for the priests of the parish, is now a girls' school, after passing through some inglorious times. The design of the door is very like that at Great Snoring Rectory, not many miles away. In the same street is the doorway with spiral columns of wood (heavily loaded with paint). At the back of the house, which is two or three hundred years older, is a lofty brick tower from which one may suppose the master would watch for the arrival of his laden argosies. The street front was built about 1707 from the designs of Henry Bell. In Nelson Street is the Vicarage; its long low front has an upper floor, perhaps Jacobean, and a ground floor of commonplace brick, but with a handsome door brought, I was told, from an older vicarage house near by. Next to the Vicarage is a humble kind of quadrangle called Hampton Court, entered by way of a Gothic archway, from the roof of which hangs a cannon ball, said to be the one that went through the roof of St. Margaret's Church in the siege of 1643. The remaining doorway of my group is in St. Nicholas Street, and was in rather bad condition. In the adjoining St. Ann's Street there was a large Georgian house, said to have belonged to Sir Robert Walpole, member for Lynn. It was empty when I saw it, and apparently doomed to demolition. Perhaps it has disappeared now.

Across the street stands St. Nicholas Church (or rather Chapel, for it has no separate parish, and is served by the clergy of St. Margaret's, the mother church). It is a quite large Perpendicular church of the "hall" type, and was completed about 1420. A spire was added during the restoration in 1868 by Sir Gilbert Scott, when, it would seem, a good deal of the old woodwork was cleared out. The organ case, Litany desk, and other well-designed fittings are new, and were given by Mr. Beloe. The font dates from 1627, but the cover is modern, although it follows the lines of the old one as represented in engravings. The woodwork of the extremely beautiful south door has possibly been restored, for one can hardly imagine such delicately carved details to have lasted so many years uninjured. The western double doorway is almost as good as the south door. Its head rises above the sill line of the west window, a huge thing of eleven lights. The east window is almost as wide, and has nine lights.

St. Margaret's Church is more varied in period and details than St. Nicholas, having retained a good deal of Early English work, especially in the two western towers. The nave was rebuilt after a great storm in 1741, and has the defects of that dark time. There are some sixteen misericordes of the fourteenth century, a length of rich Jacobean screenwork under the organ, and an organ front of 1754 built by Snetzler. Dr. Burney was at one time organist here, and his "History of Music" was largely written during his stay. The present organist, Mr. W. J. Comley, is worthily carrying on the musical traditions of the church, and I was fortunate enough to be present at one of his Sunday evening recitals. With a reference to the two famous Flemish brasses—formerly in the chancel, but now on the floor under the south-west tower—these brief notes may serve to send more pilgrims to the interesting town of King's Lynn.

EIGHTEENTH-CENTURY STAIRCASE.

THE measured drawing of a staircase from a house in Sunderland by "Improver" was awarded a prize in "The Architect" Students' Sketching and Measuring Club.

THE death is announced of Lieutenant-Colonel Ernest Herman Haig, of the Royal Engineers, at the age of forty-eight. He was the eldest son of Mr. Axel Herman Haig, the artist, and entered the Army in 1887, receiving his majority in 1905. He was gazetted lieutenant-colonel in June last, and was stationed at Shoeburyness, where he died.

THE annual general meeting of the Dundee Institute of Architects was held in the Institute Rooms, 43 Nethergate, Dundee, on the 30th ult., when the following office-bearers were elected for the ensuing session: President, Mr. Charles G. Soutar, Dundee; Vice-President, Mr. James Findley, Dundee; Council, Messrs. A. Grainger Heiton (Perth), Alexander Symon (Arbroath), G. D. B. Shepherd (Dundee), and George Pyott (Dundee); Secretary, Mr. William Salmond, 6 High Street, Dundee; Treasurer, Mr. David L. Allan, Dundee.

AT a meeting last week of the Hemsworth Rural Council, Mr. J. S. Potts moved that the Council consider the desirability of appointing a fully qualified architect to prepare and supervise the housing schemes proposed to be undertaken in the various townships of the rural area. He said they had every confidence in their surveyor, but this was a big undertaking, involving the expenditure of a large sum of money. The number of houses they had already agreed to build was something like 160, which, if they estimated the capital investment in each house at £180, meant a total capital outlay of £28,000. The number of houses actually asked for in the area was 600, representing an outlay of £115,000. If the surveyor was going to supervise that scheme his ordinary duties would be interfered with. The Council would be well advised to have a man who could devote the whole of his time to the work, especially if they could get one with previous experience. It was eventually decided to refer the matter to the parish councils concerned for their recommendations.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A BUSINESS meeting of the Institute was held on Monday evening, the President, Mr. Ernest Newton, A.R.A., occupying the chair over about thirty members.

The Hon. Secretary, Mr. E. Guy Dawber, announced the death of Mr. E. A. Johnson (F.) and Mr. W. Newton Dunn (F.).

Mr. P. M. Ware, of Kimberley, South Africa, was elected an Associate.

Referring to Mr. Max Clarke's motion, the President said that it might be considered not to be strictly in order, but he had no wish to attempt to stifle discussion. The debate would take place without prejudice to any action that the Council might or might not take according to the by-laws.

Mr. Max Clarke then moved his resolution: "That the Austrians and Hungarians, seven in number, now enemies of the King, whose names appear in the 'Kalendar' for the present session, on page 231, cease to be members of this Institute and their names be removed from the list of members. And also that the Germans, eight in number, now enemies of the King, whose names appear in the 'Kalendar' for the present session, on page 232, be dealt with in a similar manner."

Mr. Clarke referred to the vandalisms and atrocities practised in Belgium and to the attack on Scarborough. He thought that the only way that the Institute could express its detestation of these occurrences was by expelling those members who belonged to the hostile nations.

Mr. Maurice B. Adams, in seconding, said that at the present moment they could have no wish to have any association with German architects. Many of them had feelings which were too strong to express in parliamentary language.

Mr. William Woodward said he had carefully read through the Belgian and French official White and Red Books, which proved the terrible devastation and cruelties that had taken place in Belgium and Northern France. He suggested that the alien enemy members should be asked to resign, as they had no feeling against them individually, but only as representing their nation.

Mr. Francis Hooper moved an amendment that it was beneath the dignity of the Institute to expel those foreign members. At one time the French had been regarded as the great enemies of England; at another the Russians. They should look forward to the period of reconstruction that would take place after the war was over.

Mr. W. R. Davidge seconded. He claimed that these alien members were in the position of hostages, and that it would be cowardly to do anything against them. Their membership was practically suspended for the period of the war.

Mr. G. A. T. Middleton suggested that on the declaration of war the hostile members, ipso facto, ceased to be members.

Mr. A. R. Jemmett said it was childish conduct to penalise these members for the faults of the nation to which they belonged.

On a vote being taken ten members were in favour of the amendment and ten against.

The President said that it was his duty as Chairman to maintain a strictly impartial attitude, but this voting had brought him into the line of fire. He happened to have a strong personal opinion in the matter and would give his casting vote. He thought that they should look forward to the new Germany that would arise after the war was over as a nation awaking from a horrid dream. He voted for the amendment.

On the amendment being put as a substantive motion it was carried.

This concluded the business, and the meeting adjourned at 9 P.M.

R.I.B.A. EXAMINATIONS.

THE FINAL: ALTERNATIVE PROBLEMS IN DESIGNS.

INSTRUCTIONS TO CANDIDATES.

1. The drawings, which should preferably be on uniform sheets of paper of not less than imperial size, must be sent to the Secretary of the Board of Architectural Education, Royal Institute of British Architects, 9 Conduit Street, W., on or before the dates specified below.

2. Each set of drawings must be signed by the author, and his full name and address, and the name of the school, if any, in which the drawings have been prepared, must be attached thereto.

3. All designs, whether done in a school or not, must be accompanied by a declaration from the student that the design is his own work and that the drawings have been wholly executed by him. In the preparation of the design the student may profit by advice.

4. Drawings for subjects (*a*) are to have the shadows projected at an angle of 45° in line, monochrome, or colour. Drawings in subjects (*b*) are to be finished as working drawings. Lettering on all drawings must be of a clear, scholarly, and unaffected character.

SUBJECT XIX.

(*a*) A memorial to Lord Roberts overlooking the training ground of a garrison city; on a low hill rising with a general inclination of one in five. The memorial is to stand on the summit of the hill upon a level plateau about 80 feet in diameter. The height of the memorial is not to exceed 120 feet.

Drawings.—General plan to $\frac{1}{16}$-inch scale. Detail plan (so far as may be necessary), elevations and sections; scale optional.

(*b*) A garage for a large country mansion. Provide for four owners' and four visitors' cars, and washing place; residence for chief chauffeur, and sleeping accommodation for four visitors' chauffeurs. Provide also accommodation for artesian well, pump, and water tower to supply the mansion; electric lighting and power plant, engineer's workshop. Heating, fuel store, and incidental requirements to be provided. The site is not limited; the courtyard type of plan is suggested.

Drawings.—Plans, elevations, and sections to $\frac{1}{8}$-inch scale, and $\frac{1}{2}$-inch detail of a portion.

SUBJECT XX.

(*a*) A façade for an important firm of fine art publishers in the principal street of a capital city. Width of site 36 feet (between buildings). Height not to exceed four floors above pavement line; there is to be a shop front on the ground floor, and a separate entrance to a fine art gallery on the first floor. The facing material to be generally of stone, but brick is not to be used.

Drawings.—Plans at ground and first-floor levels, showing arrangement of façade; elevation and section. All to $\frac{1}{2}$-inch scale.

(*b*) A detached swimming bath for a boys' public school. Bath not to exceed 70 feet in length.

Drawings.—Plan, elevations, and longitudinal section to $\frac{1}{8}$-inch scale, and a cross section through bath to $\frac{1}{2}$-inch scale.

SUBJECT XXI.

(*a*) A band stand in a public park to accommodate twenty performers. To be arranged as a large alcove in connection with a colonnade.

Drawings.—Plan, elevation, and section to $\frac{1}{8}$-inch scale. Details to $\frac{1}{2}$-inch scale.

(*b*) A hostel for male students on a detached suburban site to accommodate thirty, and to include a suite of rooms for married warden.

Drawings.—Plans, elevations, and sections to $\frac{1}{8}$-inch scale.

Dates for Submission of Designs in 1915.

Toronto	31st March	30th May	31st July

COMPETITION DESIGNS FOR THE BUILDING OF THE RUSSIAN BANK FOR FOREIGN TRADE, PETROGRAD.

LAST year the Russian Bank for Foreign Trade, one of the wealthiest in Russia, announced an open competition for a design for a building to accommodate the head offices of the bank, as well as a number of private offices. Sums amounting to 9.000 roubles (more than £900) were offered as premiums for the best designs submitted. Simultaneously a limited competition was arranged, in which a number of well-known Russian and foreign architects were invited to join, and in which each competitor was to receive an equal premium.

In all thirty-six designs were submitted, seven of which, entered for the limited competition, we reproduce from the Petrograd *Zodtchy*, in whose pages they were originally

Digitized by Google

THE RUSSIAN BANK FOR FOREIGN TRADE, PETROGRAD. Design by M. J. FOMIN, Petrograd.

published. Four of these are the work of Russian architects and the remaining three by a French, a Belgian, and a German architect respectively.

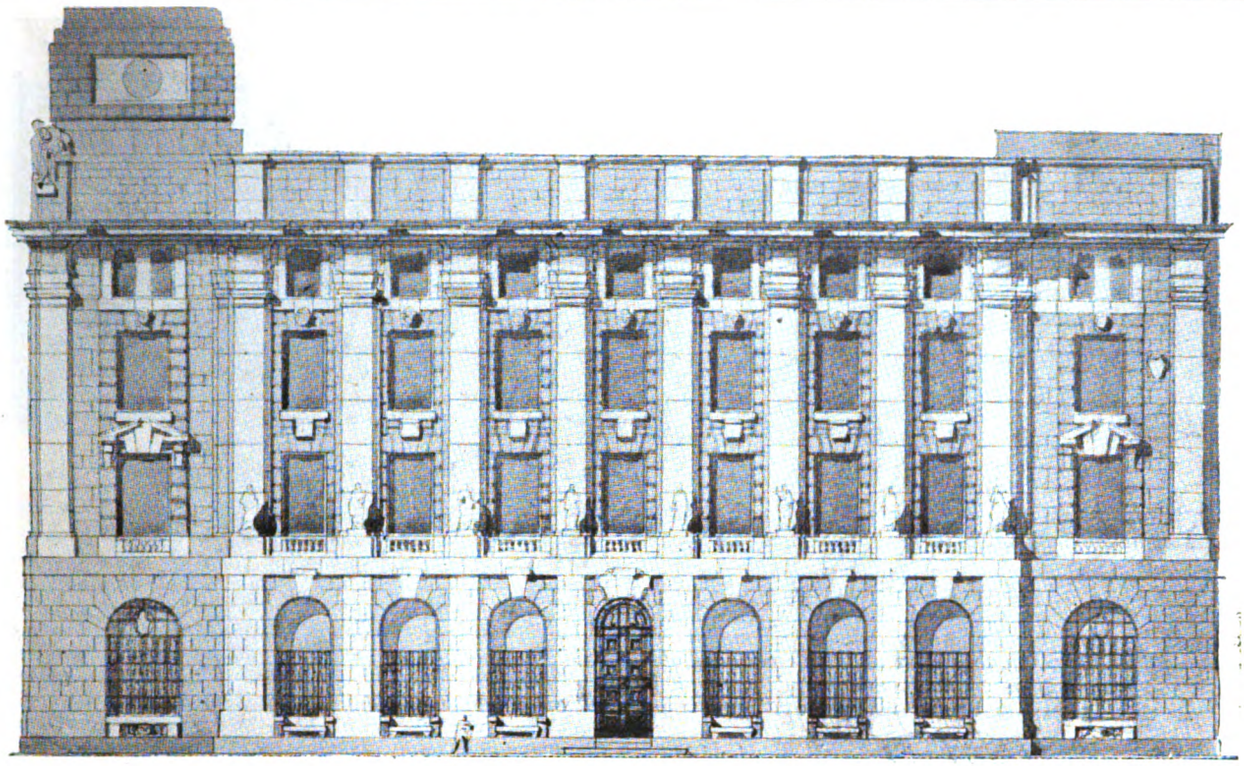
It would perhaps be difficult to find another so characteristic an example of the prevailing tendencies in the modern architecture of the four countries concerned as is afforded by the front elevations in these designs. We see the classical spirit of modern Russian architecture evidenced in the designs of MM. Fomin, Lidval, Lialevitch, and Peretiatkovitch—all distinguished representatives of the classical movement in Russia, whose works have on several occasions received notice in these pages. The features of the national architecture of Belgium, France, and Germany are strongly marked in the designs of M. Saintenoy, M. Bocage, and Herr Jessen, but perhaps in no other to so striking a degree as in that of the last-named. The clear-cut, balanced mind of a German, the worship of force and order, are displayed in the thoroughly typical proportions of the building and the treatment of details, such as is, for instance, shown in the windows, the statuary, and the rustication.

TESTS OF BOND BETWEEN CONCRETE AND STEEL.*

Preliminary.—The usefulness of reinforced concrete as a structural material depends on the strength and permanency of the bond between the concrete and the reinforcing metal, and for this reason bond resistance has received much attention from engineers and experimenters. It is said that Thaddeus Hyatt made tests to determine the bond between concrete and iron bars as early as 1876. During the past decade numerous bond tests have been reported. These tests have been characterised by a lack of uniformity in the form of the test specimen and in the methods of conducting the tests, as well as by the wide variations in the values reported for bond resistance. In nearly all the tests thus far published values of maximum bond resistance only have been given. These test results and the discussions called forth by them have furnished the basis for a great variety of opinions as to the value of bond resistance. Many explanations of the source and nature of bond resistance have been given. Various methods have been advocated for increasing bond resistance, and numerous devices have been employed for this purpose.

Present American practice is fairly standardised as to the bond stresses to be used in designing, but a rational basis for the stresses used is lacking and there is a great diversity of practice in the methods of calculating these stresses. There are many phases of bond action which are not now understood. It is evident that the distribution of bond stress in reinforced concrete members under load and the nature and value of bond resistance under given conditions may well be the subject of experimental investigation.

Scope of Bulletin.—The tests reported in this bulletin were undertaken with a view to securing additional information on the nature of the bond resistance of reinforcing bars in concrete, to determining values of bond resistance for a wide range of conditions, and to studying bond action in specimens of different forms. Tests were made on pull-out specimens and on reinforced concrete beams. In both forms of specimen attention was given to obtaining accurate measurement of the slip of bar through the concrete as the loading progressed. In many of the beam tests the slip of bar at various points along its length was measured for different loads. In the discussion of bond resistance the load-slip-of-bar relation has been utilised to a considerable extent. These measurements are useful in indicating the distribution of bond stress. They are particularly significant in the beam tests. In a few of the beam tests the distribution of bond stress was studied by measuring the changes in the stress in the longitudinal reinforcement throughout the length. The values found for bond resistance and the relative bond resistance found in beam tests and pull-out specimens are also interesting features of the investigation.



The pull-out tests consisted in applying load to a short reinforcing bar embedded in a block of concrete. The concrete block was generally 8 inches in diameter and 8 inches long, with the bar embedded axially. In certain groups of tests these dimensions were varied. The size of bar used varied between ¼ inch and 1¼ inch. The pull-out tests covered a wide range and included effect of dimensions of specimen, effect of form of bar, effect of conditions of storage, effect of age and mix, using both plain and deformed bars, effect of different methods of loading, bond resistance of concrete setting under pressure, effect of re-applied loads, comparison with the bond resistance of reinforced concrete beams, &c. The deformed bars used included most of the forms in use at the time the work was begun, but it should be noted that the tests with deformed bars were intended to bring out the action of the deformed bar as contrasted with the plain bar and not to determine the value of particular forms of bars.

A special effort was made to determine the behaviour of beams subjected to high bond stresses. The beams tested were 8 by 12 inches in section, with an effective depth of 10 inches. The span length was generally 6 feet; a few beams were tested with span lengths of 5 to 10 feet. All beams were tested with two symmetrical loads, generally at the one-third points of the span. With the exception of six tests, the longitudinal reinforcement consisted of a single bar of large diameter placed horizontally throughout the length of the beam. Both plain and deformed bars were used.

Preliminary Discussion of the Nature of Bond Resistance.—In this preliminary discussion it will be necessary to anticipate certain conclusions which appear in the following pages. The tests therein reported indicate that if

* Abstract from Bulletin of the University of Illinois, U.S.A., on "Tests of Bond between Concrete and Steel." By Duff A. Abrams.

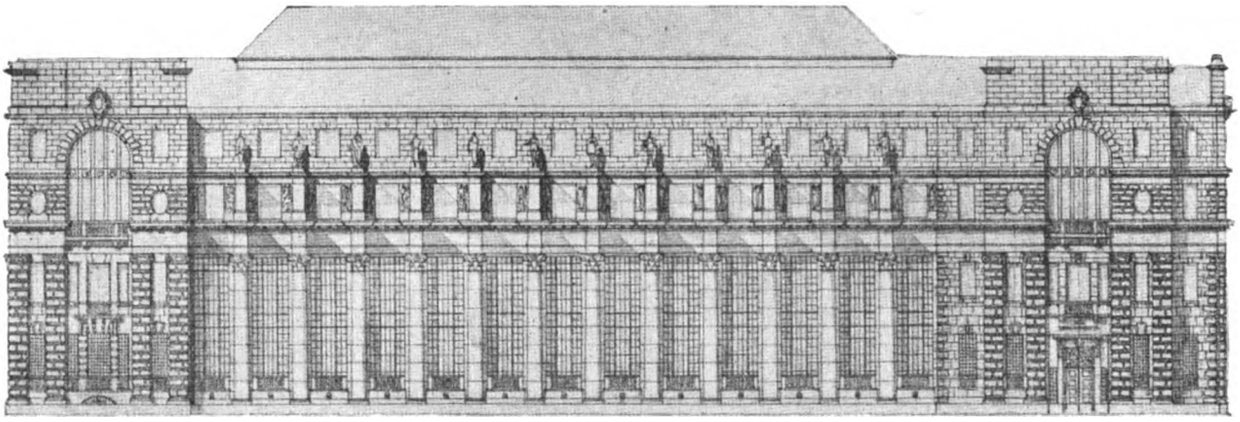
THE RUSSIAN BANK FOR FOREIGN TRADE, PETROGRAD. Design by M. F. LIDVAL Petrograd

a bar embedded in concrete is subjected to a tensile stress sufficient to overcome the bond resistance and withdraw the bar, certain definite relations exist between the amount of movement of the bar and the bond stresses developed. In the case of plain bars of ordinary mill surface there is no appreciable movement of the bar until a bond stress about 60 per cent. of the maximum bond resistance has been developed. If the bar is further stressed until the slip amounts to, say, 0.1 inch, it will be seen that the bond-slip relations have undergone numerous changes. After slipping begins, the bond stress increases with further movement of the bar, very rapidly at first, then more slowly until the maximum bond resistance is reached. After the maximum bond resistance is reached, the bond stress drops off with further slip, and at a slip of, say, 0.1 inch, amounts to about 50 to 60 per cent. of the maximum.



For purposes of this discussion bond resistance may be divided into two elements which we shall designate as (1) adhesive resistance and (2) sliding resistance. The term "adhesive resistance" is used to designate the bond resistance developed before movement of bar with respect to the adjacent concrete begins. "Sliding resistance" is applied to the resistance developed as a result of the movement of the bar. Adhesive resistance may be considered as due to tangential adhesion between the concrete and steel and to static friction. The origin of tangential adhesion is not well understood, but its presence is a matter of universal experience with materials of the nature of mortar and concrete. It is recognised that tangential adhesion does not account for all the resistance developed before slipping begins, but the difference may be attributed to static friction developed by the pressure or grip of the concrete on the bar. As soon as the adhesive resistance is overcome —that is, as soon as the bond stress exceeds the sum of the tangential adhesion plus the static friction—there is a movement of the bar with respect to the adjacent concrete. Although we cannot accurately divide this adhesive resistance into its component elements, the sum of these elements or the total adhesive resistance can be determined, and it is found that under certain conditions it bears a definite ratio to the ultimate bond resistance.

The bond resistance which is developed after slip of bar begins may be said to be due entirely to sliding resistance. Friction between bodies in contact arises primarily from roughnesses of their surfaces; its value is expressed as the product of the coefficient of friction into the normal pressure which exists at the surfaces of contact. The static friction mentioned above is due to the same cause. The roughness of surface in the case of a bar embedded in concrete is due to inequalities in the surfaces of contact which arise from irregularities of section and alignment of the bar and the corresponding conformation of the concrete. The coefficient of friction between concrete and steel for the conditions present in these tests has not been determined. The normal pressure at the surface of the bar may be due to the following causes: (*a*) Initial stresses generated by shrinkage of the concrete during setting and hardening; (*b*) wedging of the bar in the concrete following a movement from its original position. This wedging is caused by the inequalities in the bar mentioned above, and in itself will give an added resistance. Apparently it is augmented under certain conditions by concrete adhering to the bar.

In the above discussion the various components of bond resistance have been mentioned in the order in which they become effective in resisting bond stress. It is evident from these considerations that what has been termed adhesive resistance—that is, the amount of bond resistance which may be utilised before slipping begins—is by far the more significant element. While frictional resistance is of importance, reliance should not be placed on this element of bond resistance.

It was stated above that we cannot accurately divide adhesive resistance into its component elements; however, certain tests do give some indication of the values of these components. A large number of specimens with polished round bars embedded 8 inches in 1-2-4 concrete tested at age of sixty days gave a maximum bond resistance of about 160 lb. per square inch. In these tests frictional resistance (both static and sliding) was reduced to a minimum, and bond resistance after slipping began was almost nil. We may conclude, then, that 160 lb. per square inch represents about what may be expected for the tangential adhesion between steel and concrete of this quality. It seems probable that the same value may be used for the tangential adhesion between any clean steel surface and concrete of the quality used. Round bars with ordinary mill surface tested under the same conditions as the polished bars show slip to begin at, say, 260 lb. per square inch with a maximum bond resistance of about 440 lb. per square inch, developed after a slip of about 0.01 inch had occurred. The difference of about 100 lb. per square inch between the bond resistance developed by the polished bars and by the ordinary bars when slipping begins (corresponding also to the maximum for the polished bars) may be said to represent the value of static friction for the bars of ordinary mill surface above that of polished bars embedded in the same concrete. The additional bond resistance developed

Digitized by Google

THE RUSSIAN BANK FOR FOREIGN TRADE, PETROGRAD. Design by M C. LIALEVITCH, Petrograd.

by the ordinary bars after slipping begins is due to frictional resistance.

The above observations refer primarily to the general case of bond between concrete and plain bars; for deformed bars certain obvious modifications in these statements would be necessary. It will be seen later that the conditions under which the specimen is moulded and tested have an important bearing on the bond resistance developed in any case.

In reinforced concrete beams, where the reinforcing bars are considered to take the main tensile stresses, the phenomena of bond action are complicated by the stiffness of the adjoining concrete in resisting stretching concurrently with the steel. This results in anti-stretch slip. The presence of this stress makes it desirable to distinguish between the phenomenon of anti-stretch slip and the slip produced by ordinary beam action.

Summary.—The tests covered a wide range of conditions, and the results have a significant bearing on the nature of bond resistance, the action of bars of different forms under bond stress, and the behaviour of beams subjected to high bond stresses. The load-slip determinations have given definite information on the nature and distribution of bond resistance. The following is a résumé of the principal observations and conclusions which have been stated and discussed in the text. Paragraphs 2 to 34, inclusive, refer primarily to the results of the pull-out tests.

(1) Bond betwen concrete and steel may be divided into two principal elements—adhesive resistance and sliding resistance. The source of adhesive resistance is not known, but its presence is a matter of universal experience with materials of the nature of mortar and concrete. Sliding resistance arises from inequalities of the surface of the bar and irregularities of its section and alignment together with the corresponding conformations in the concrete. The adhesive resistance must be overcome before sliding resistance comes into action. In other words, the two elements of bond resistance are not effective at the same time at a given point. Many evidences of the tests indicate that adhesive resistance is much the more important element of bond resistance.

(2) Pull-out tests with plain bars show that a considerable bond stress is developed before a measurable slip is produced. Slip of bar begins as soon as the adhesive resistance is overcome. After the adhesive resistance is overcome, a further slip without an opportunity of rest is accompanied by a rapidly increasing bond stress until a maximum bond resistance is reached at a definite amount of slip.

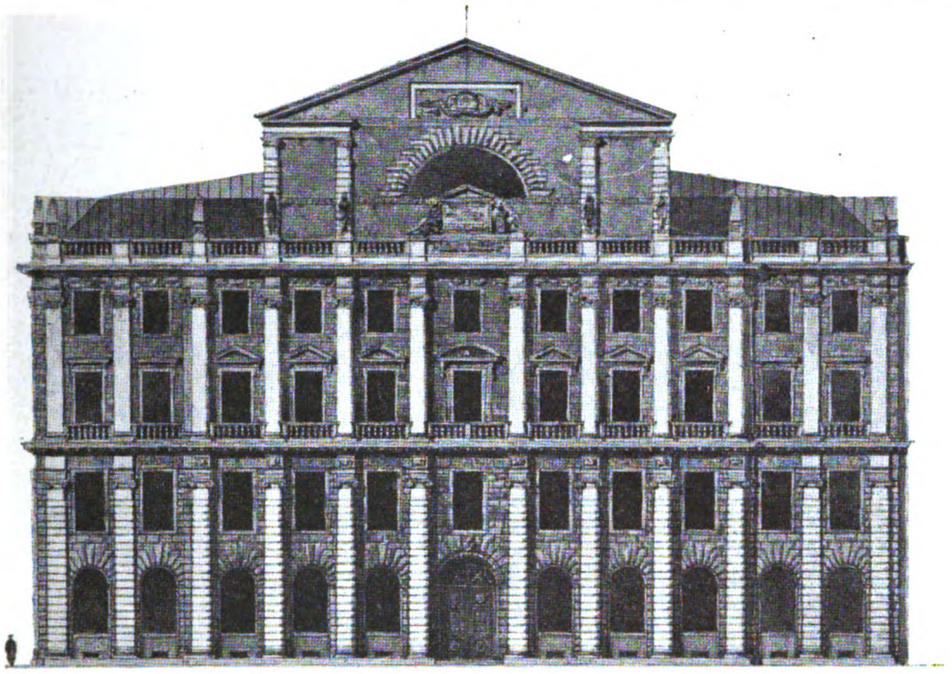
(3) The true relation of slip of bar to bond stress can best be studied by considering the action of a bar over a very short section of the embedded length. The difficulties arising from secondary stresses made it impracticable to conduct tests on bars embedded very short lengths. The desired results were obtained by varying the forms of the specimens in such a way that the effect of different combinations of dimensions could be studied.

(4) Pull-out tests with plain bars of the same size embedded different lengths furnish data which suggest the values of bond resistance over a very short length of embedment, or indicate values of bond resistance which are independent of the length of embedment. Tests with bars of different size which were embedded a distance proportional to their diameters give the true relation when the effect of size of bar is eliminated. Two series of tests of this kind on plain round bars of ordinary mill surface gave almost identical values for bond resistance after eliminating the effect of length of embedment and size of bar, and we may consider that these values represent the stresses which were developed in turn over each unit of area of the embedded bar as it was withdrawn by a load applied by the method used in these tests. These tests showed that for concrete of the kind used (a 1-2-4 mix, stored in damp sand and tested at the age of about sixty days) the first measurable slip of bar came at a bond stress of about 260 lb. per square inch, and that the maximum bond resistance reached an average value of 440 lb. per square inch. If we conclude that adhesive resistance was overcome at the first measurable slip, it will be seen that the adhesive resistance was about 60 per cent. of the maximum bond resistance. This ratio did not vary very much for a wide range of mixes, ages, size of bar, condition of storage, &c.

(5) Sliding resistance reached its maximum value for plain bars of ordinary mill surface at a slip of about 0.01 in. The constancy in the amount of slip corresponding to the maximum bond resistance for a wide range of mixes, ages, sizes of bar, conditions of storages, &c., is a noteworthy feature of the tests. With further slip the sliding resistance decreased slowly at first, then more rapidly, until with a slip of 0.1 in. the bond resistance was about one-half its maximum value.

(6) Pull-out tests with plain round bars show end slip to begin at an average bond stress equal to about one-sixth the compressive strength of 6-in. cubes from the same concrete; the maximum bond resistance is equal to about one-fourth the compressive strength of 6-in. cubes. These values were about the same for a wide range of mixes, ages and conditions of storage. In terms of the compressive strength of 8 by 16-in. concrete cylinders these values would be about 13 per cent. for first end slip and 19 per cent. for the maximum bond resistance.

(7) The tests indicate that bond stress is not uniformly distributed along a bar embedded any considerable length and having the load applied at one end. Slip of bar begins first at the point where the bar enters the concrete, and the bond stress must be greater here than elsewhere until a sufficient slip has occurred to develop the maximum bond resistance at this point. Slip of bar begins last at the free end of the bar. After slip becomes general, there is an approximate equality of bond stress throughout the embedded length.



(8) Small bars gave a bond resistance somewhat higher than the large bars during the early stages of the test. This was probably on account of greater irregularity of section and alignment of the smaller bars. The maximum bond resistance was not materially different for bars of different diameters.

(9) Computations based on the elastic properties of the materials indicate that in the pull-out tests the tensile deformation in the bar had a much greater effect on the amount of bond stress which permitted a given slip of bar than had the compressive deformation in the concrete block in which the bar was embeded.

(10) Rusted bars gave bond resistances about 15 per cent. higher than similar bars with ordinary mill surface.

(11) The tests with flat bars showed wide variations

Digitized by Google

THE RUSSIAN BANK FOR FOREIGN TRADE, PETROGRAD. Design by M. M. PERETIAKOVITCH, Petrograd.

of bond resistance and were not conclusive. Square bars gave values of unit-stress about 75 per cent. of those obtained with plain round bars.

(12) T-bars gave lower unit bond resistance than plain round bars, but gave about double the bond resistance per unit of length that was found for the plain round bars of the same sectional area.

(13) With polished bars the bond resistance is due almost entirely to adhesion between the concrete and steel. Numerous tests with polished bars embedded in 1-2-4 concrete and tested at sixty days indicated a maximum bond resistance of about 160 lb. per square inch, or about 60 per cent. of the bond resistance of bars of ordinary surface at small amounts of slip. This value agrees closely with tests reported elsewhere, and apparently represents the value of the tangential adhesion between any clean steel and concrete of this quality. The sliding resistance of polished bars was very low.

(14) Tests with polished bars with wedging and non-wedging tapers showed that adhesion was broken for both types of bar at about the same bond stress as in the polished bars of uniform section.

(15) The tests with polished bars with wedging taper showed that after the adhesion was broken a considerable movement of the bar (as much as $\frac{1}{4}$ in. with the smallest tapers) was required before the bond resistance again reached the amount which was at first carried by the adhesive resistance. The amount of movement necessary to restore the bond stress to the value of the original adhesive resistance was inversely proportional to the amount of taper. This indicates that a definite normal compression must be developed in the surrounding concrete before a longitudinal component equivalent to the original tangential adhesion is produced.

(16) It was noted in the tests with plain bars that sliding resistance was due to inequalities of the surface of the bar and to irregularities of its section and alignment. The projections on a deformed bar give an exaggerated condition of inequality of surface or irregularity of section. Adhesive resistance must be destroyed and the usual sliding resistance largely overcome and the concrete ahead of the projections must undergo an appreciable compressive deformation before the projections on a deformed bar become effective in taking bond stress. The tests indicate that the projections do not materially assist in resisting a force tending to withdraw the bar until a slip has occurred approximating that corresponding to the maximum sliding resistance of plain bars. As slip continues a larger and larger portion of the bond stress is taken by direct bearing of the projections on the concrete ahead.

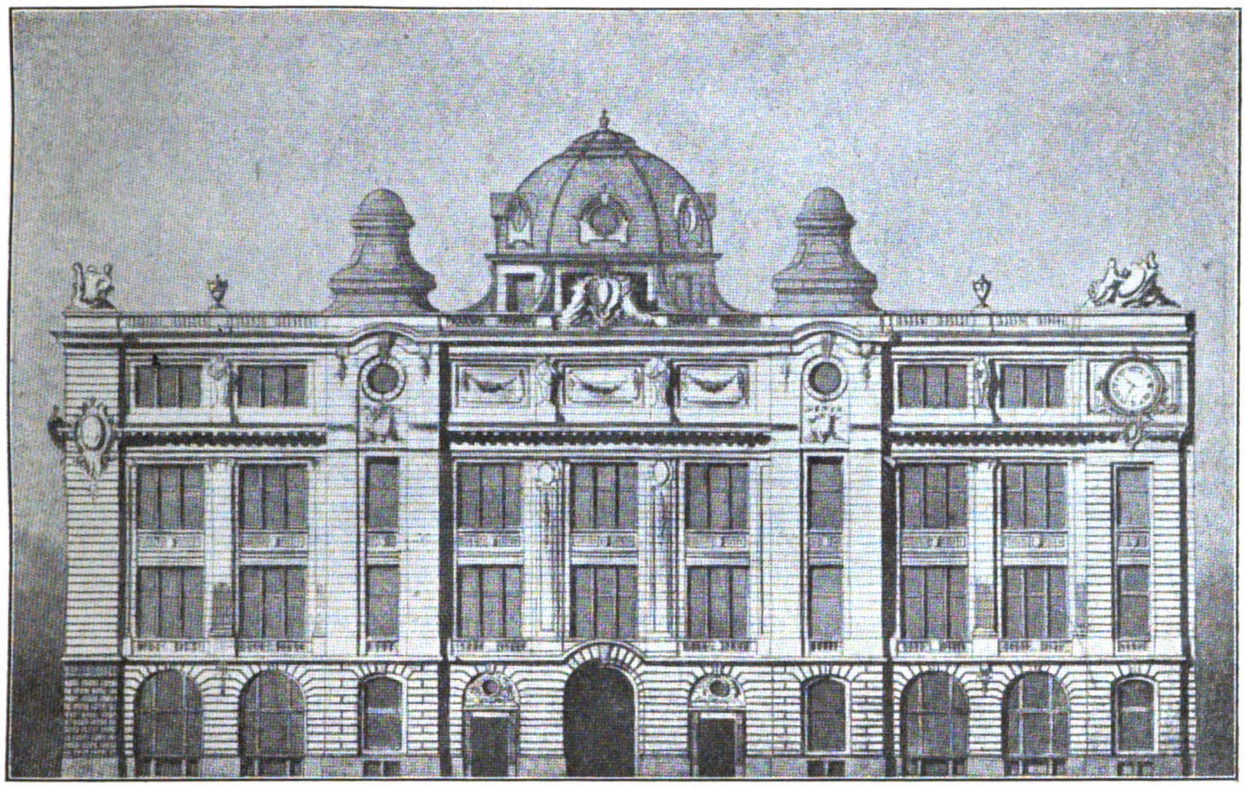
(17) In determining the comparative merits of deformed bars, the bar which longest resists beginning of slip should be rated highest, other considerations being equal. The bond stresses developed at an end slip of 0.001 inch furnished the principal basis of comparison for the different types of deformed bars. At an end slip of 0.001 inch 12 sets of deformed bars of $\frac{3}{4}$-inch and larger sizes embedded 8 inch in 1-2-4 concrete, tested at about 2 months, developed an average bond resistance of 318 lb. per square inch, 4 per cent. higher than the corresponding value for plain bars. At this stage of the test, two sets of deformed bars gave practically the same bond resistance, five sets gave lower values, and five sets higher values than the plain rounds. At an end slip of 0.01 inch, corresponding to the maximum bond resistance of plain bars, the average bond resistance of the 12 sets of deformed bars was 445 lb. per square inch, 10 per cent. higher than plain rounds. At this stage of the test two sets gave about the same values, two sets gave lower values, and eight sets gave higher values than the plain bars. The hooping used in these specimens had a marked effect in increasing the bond resistance even at small amounts of slip.

(18) The concrete cylinders of the pull-out specimens with deformed bars were reinforced against bursting or splitting, because it was desired to study the load-slip relation through a wide range of values. The bond stresses corresponding to an end slip of 0.1 inch are the highest stresses reported for the deformed bars. In only a few tests was the maximum bond resistance reached at an end slip less than 0.1 inch. It should be recognised that, in general, the bond stresses reported for deformed bars at end slip of 0.05 and 0.1 inch could not have been developed with bars embedded in unreinforced blocks. These high values of bond resistance must not be considered as available under the usual conditions of bond action in reinforced concrete members. In the tests in which the blocks were not reinforced, evidence of splitting of the blocks was found at end slips of 0.02 to 0.05 inch.

(19) The normal components of the bearing stresses developed by the projections on a deformed bar may produce very destructive bursting stresses in the surrounding concrete. The bearing stress between the projections and the concrete in the tests with certain types of commercial deformed bars was computed to be from 5,800 to 14,000 lb. per square inch at the highest bond stresses considered in these tests. For bars having projections of different heights and spacing, the bearing stresses on the projections at the highest bond stresses considered were inversely proportional to the bond stress which had been developed by the bar at an end slip of 0.01 inch, the slip at which the projections were beginning to be effective. These considerations show that the ratio of the area of the projections measured at right angles to the bar to the superficial area of the bar in the same length is the proper criterion for judging of the effective bond resistance of a deformed bar. In some forms of bar the bearing stresses must have been much higher

Digitized by Google

THE RUSSIAN BANK FOR FOREIGN TRADE PETROGRAD. Design by M. PAUL SAINTENOY, Brussels.



than the values given above. The large slip and the high bearing stresses developed in the later stages of the tests show the absurdity of seriously considering the extremely high values that are usually reported to be the true bond resistance of many types of deformed bars.

(20) Round bars with standard V-shaped threads gave much higher bond resistance at low slips than the commercial deformed bars. The average bond resistance at an end slip of 0.001 inch was 612 lb. per square inch. The maximum bond resistance was 745 lb. per square inch. These were the only deformed bar tests in which failure came by shearing the surrounding concrete.

(21) In a deformed bar of good design the projections should present bearing faces as nearly as possible at right angles to the axis of the bar. The areas of the projections should be such as to preserve the proper ratio between the bearing stress against the concrete ahead of the projections and the shearing stress over the surrounding envelope of concrete. Failure by shearing of the concrete should be avoided. The tests indicate that the areas of the projections measured at right angles to the axis of the bar should not be less than, say, 20 per cent. of the superficial area of the bar. A closer spacing of the projections than is used in commercial deformed bars would be of advantage. Advocates of the deformed bar would do well to recognise the fact that in a deformed bar which may be expected to develop a high bond resistance, a certain amount of metal must be used in the projections which probably will not be available for taking tensile stress.

(22) The 1-inch twisted square bars gave a bond resistance per unit of surface at an end slip of 0.001 inch, only 88 per cent. of that for the plain rounds. Following an end slip of about 0.01 inch, these bars showed a decided decrease in bond resistance, and a slip of 5 to 10 times this amount was required to cause the bond resistance to regain its first maximum value. After this, the bond resistance gradually rose as the bar was withdrawn. Some of the bars were withdrawn 2 or 3 inches before the highest resistance was reached. The apparent bond stresses at these slips were very high; but, of course, such stresses and

Digitized by Google

THE RUSSIAN BANK FOR FOREIGN TRADE, PETROGRAD. Design by M. ADOLPHE BOCAGE, Paris.

slips could not be developed in a structure and could not have been developed in the tests had the blocks not been reinforced against bursting. Such values are entirely meaningless under any rational interpretation of the tests.

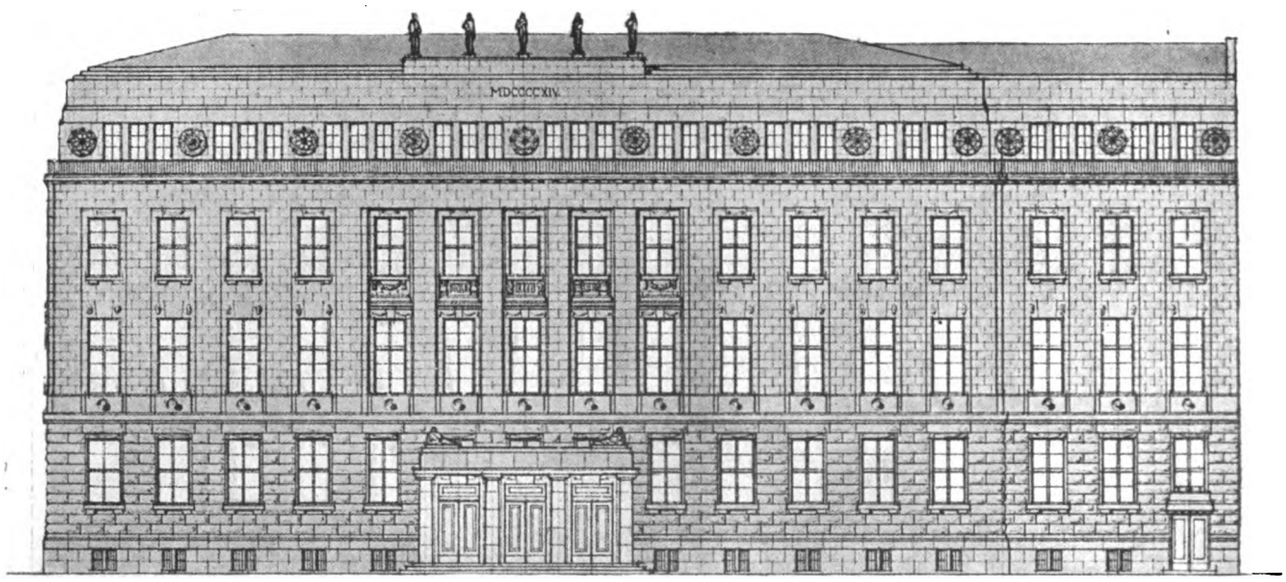
(23) The load-slip curves for twisted square bars are similar to those for polished bars with wedging taper. The twisted bar is essentially a combination of the wedging and non-wedging taper. As the bar is drawn through the concrete the wedging tapers are drawn more firmly against the concrete ahead, while at the same time the non-wedging tapers are separated from the concrete with which they were originally in contact. The drop in the load-slip curves after an end slip of about 0.01 inch shows that the separation of about one-half of the surface of the bar from its original contact and the continued sliding of the flatter portions of the bar, until a large slip has occurred, have a greater influence in reducing the average bond resistance than the increased bearing of the wedging tapers has in raising the bond resistance. The results found with the twisted square bar do not justify its present widespread popularity as a reinforcing material.

(To be concluded.)

MUNICIPAL ART LEAGUE OF CHICAGO.

THE Municipal Art League has decidedly broadened its field this year by proposing to encourage industrial art throughout the entire State of Illinois. Its first step was the offering of four prizes of $25 each at the recent industrial art exhibition, held at the Art Institute. Since then it has organised a committee whose duty is the fostering and encouragement of art in handiwork and manufacture and the "application of art to all phases of Illinois resources and industry." The committee plans to encourage handiwork in the home, such as lacemaking, weaving, crocheting, basketry, and embroidery by women who crave the opportunity to produce beauty, but who need stimulation and instruction. It will try to bring about a closer relation between the manufacturer and the artist in order to improve the design of objects manufactured for daily use, and will also try to conserve crafts which have been mastered in Europe by foreign craftsmen, who find that in this country their efforts are supplanted by machinery.

As a means of accomplishing this the Municipal Art League will offer prizes at the annual art crafts exhibition at the Art Institute to exhibitors showing the best relation of art to an Illinois product, or for such examples of excellence as may be decided upon by the Industrial Art Committee and the Art Institute.



The committee will also endeavour to promote the interest and attendance of the members of the League and affiliated clubs and other citizens at exhibitions and lectures, and especially at the exhibition of art crafts held annually at the Art Institute of Chicago, giving the exhibitors the publicity necessary to bring their work before the people of Illinois. This committee will also assist in the organisation of classes for the encouragement of handicrafts and artistic trades, and co-operate with any existing organisation having a similar object in view.

One of the first steps in the prosecution of this programme will be the making of an art survey of Illinois—locating the schools and individuals that are doing industrial art. This done, the committee expects by that time to have reached a position to do active work in bringing the artist and the manufacturer together. The committee, of which Mrs. F. J. Macnish is chairman, will be composed largely of artists and architects, and will form a sort of advisory board, a go-between for the manufacturer and the artist.

In enlarging its scope the Municipal Art League hopes to accomplish some measure of the work for Illinois that the State Art Commission under the direction of Maurice I. Flagg is doing in Minnesota. Mr. Flagg travels through the country in the summer and visits the cities in the winter, bringing everywhere the message of the practicability of the artistic and showing how handiwork may be made to pay by turning it into the right channels. The Municipal Art League hopes to send a representative through the farming districts with a trunk full of draperies, odds and ends for exhibition, to show the women in the Town Hall or Sunday-school rooms how easy it is to make things right and also profitable.

The recent industrial art exhibition brought out several instances of how the Art League could co-operate with unknown makers of handiwork. Offering prizes for the best work by craftsmen in the State, the League sent out a number of letters of invitation to exhibit. These brought in twenty-five to thirty people that the Art Institute, conducting the exhibition, has never heard of before. A number of these failed to come up to the standards set for the exhibit. Their work was given due consideration, and it was pointed out why, though good, it was not quite as good as it should be. Encouraged by this helpful spirit of co-operation, these craftsmen learned improvement and declared their intention of doing work good enough to pass muster next year. Among these was a woman making baby dresses, and

Digitized by Google

THE RUSSIAN BANK FOR FOREIGN TRADE, PETROGRAD. Design by Herr H. JESSEN, Berlin.

another making dolls. Their visit to the exhibition proved an inspiration to better work, they told officials.

The Municipal Art League as a whole this year will assist the Art Institute in conducting the annual exhibition of the works of artists of Chicago and the vicinity. In the past the exhibition has been managed by a committee of the League. It was the pressing need of encouraging Chicago artists that brought the League into being in 1900. It represents seventy-two clubs and 14,000 people outside of the League membership. At dues of $2 the League has 150 member delegates and a regular annual membership of some 250. Each year it buys pictures of Chicago artists and gives prizes for others. Thus it has come to have a little collection of the best work of Chicagoans hung in the Art Institute until such time as the city sees fit to put up a municipal art gallery or afford other accommodation for the works of its sons and daughters. The municipal art gallery of the League, it should be added, is a chronological exhibition of the best works of artists who are, or have been, identified with the art life of Chicago.

The League is also endeavouring to raise a $2,000 fund for sculpture. It already has one for paintings, and from this trust fund is given each year the $100 Municipal Art League prize for portraiture. In lieu of a similar fund for sculpture, Mrs. John C. Shaffer has given for a number of years a prize of $100 for the best piece of sculpture by one artist. In addition there is the William Frederick Grower prize of $100 for the best picture or group of pictures by one artist. A curious feature of these awards is that the whole membership of the League acts as the jury. The results have been pronounced by artists to be as commendable as those of juries of leaders in the profession.

To the energy of Mrs. William Frederick Grower a large share of the League's progress is attributable. As Vice-President of the League she and the President, Ralph Clarkson, have this year increased the number of committees, appointing at the head of each a capable chairman fitted to work in a special direction. A good idea of the scope of the organisation can be gained from the titles of these committees:—

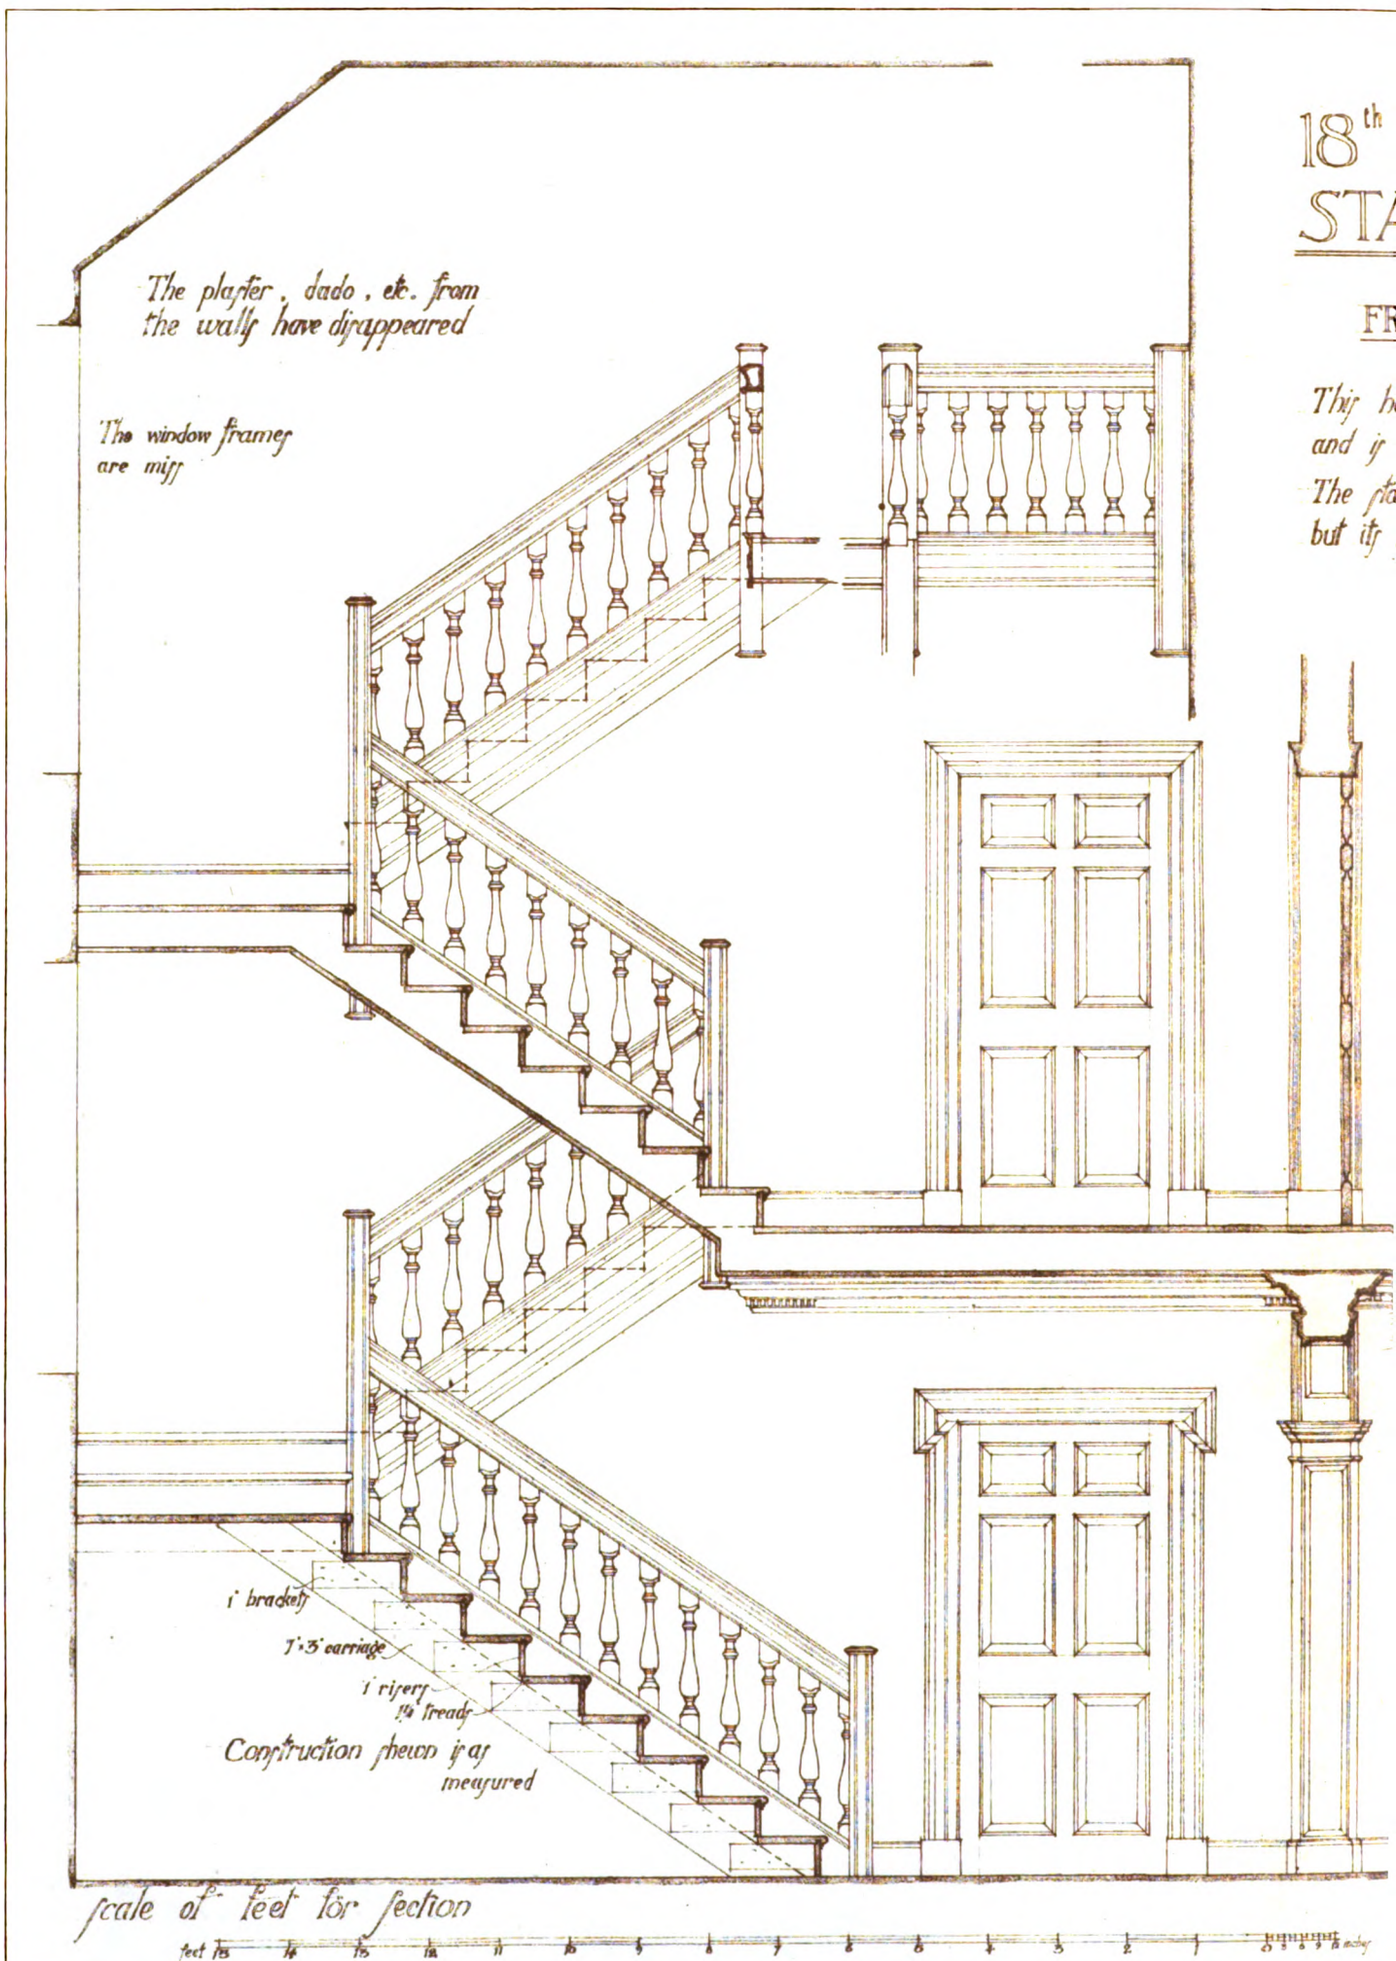
Art Activities in Illinois, Mrs. George J. Farley; Bill Boards, Everett L. Millard; Children's Art Education, Mrs. Homer H. Kingsley; City Streets, Mrs. H. S. Newton; Civics, Elmer C. Jensen; Festivals and Pageants, Kenneth S. Goodman; Industrial Art, Mrs. F. J. Macnish; Juries of Purchase and Awards, Mrs. William Frederick Grower; Membership, Eames MacVeagh; Municipal Art Gallery, Mrs. Marshall F. Holmes; Mural Decorations, Frederic Clay Bartlett; Parks and Playgrounds, Mrs. Leo Heller; Patrons, Ralph Clarkson; Special Picture Fund, Mrs. John E. Meyer; Portrait Prize Fund, Mrs. Sylvester P. Blount; Programme, Mrs. Charles S. Downs; Press, Mrs. Harry A. Bigelow; Social, Mrs. John E. Macdonald; Public Art, Mrs. William B. Frolichstein; and Young Sculptors' Fund, Miss Emily Roche.

ART IN LONDON.

DRY-POINTS AND ETCHINGS BY MR. E. S. LUMSDEN, A.R.E.

THOUGH the exhibition of Mr. Lumsden's work at the Dowdeswell Galleries is of slight compass, it is good of its kind—good, but not of outstanding merit. A lightness of touch, amounting at times to weakness and even insipidity, is apparent; and yet we would not wish to deny a general level of merit, which proves not unattractive. "The Cook Shop" is a notable morceau, where the light-and-shade effects combine with the artist's method of delineation in the production of good work. Virile, too, are such pieces as "The Palace, Jodhpur" (No. 11), "Jodhpur" (No. 16), and "Mosque and Temple"; and noticeable also are "Fort and City" and "The Market Place." Mr. Lumsden shows his appreciation of "values" in such work as "The Palace, Jodhpur," and "The Umbrella" (23); and has a very pleasant way, too, of indicating tender distances, as may be instanced by "The Prayer Flag" and "Jodhpur" (No. 11). "A River Palace" and "The Temple Steps" are very weak, nor are the remaining pieces in any respect noteworthy.

AT THE LEICESTER GALLERIES.



OF the double bill presented to inspection prior place shall be given to Mr. William Strang, A.R.A.; but this priority is due, not to the superior value of his works in relation to Mr. Will Dyson's, but is merely the result of the media used by the former ranking higher than black-and-white art, however good the latter may be.

Indeed, to speak plainly, while we thus give precedence to the media, we do not regard Mr Strang's work as being equally meritorious in scope with the display of drawings. True it is that there are a couple of brilliant exceptions. "The Mother," a life-size portrait study, is quite Titianesque in its compelling forcefulness and vivid realism, and "A Belgian Peasant Girl" is only just less impressive. The "French Priest" is another good piece of portraiture, but less pictorial; we cannot pass over "The Appeal" without favourable notice, for the simple suggestion of a tragedy all too common where men give rein to their lower nature. "A Sailor" is another good portrait study; with these, the best have been mentioned, though "Peace" is prettily conceived; and, amongst the etchings, "The Mourners" and "Despair" deserve favourable notice for their composition and their narrative value, whilst "Ghent Gate, Bruges," is a good piece of chiaroscuro and technique. In regard to the other two dozen works silence is the most charitable act, as assuredly crude colouring and crude composition are not art.

Mr. Dyson's works are much more satisfactory en masse, even if there is nothing on the same lofty plane as the best of Mr. Strang's. Were humour the sole, or even the principal, object of the drawings, they might well be regarded as a failure, for true humour needs no cap and bells and

bauble, being all-sufficient in its own display. Here, however, something grimmer, something deeper than humour is the appeal held out—and very successfully so held. Regard such works as "A Place in the Sun—the Modern Icarus," "Circe," "Modern Science and Prehistoric Savagery," "City of the Faithful," and (perhaps the very best of all) "Shade of Bismarck." Second only to these are such drawings as "Honour is Satisfied," "Give him his Due" (the Iron Cross), "Mit Compliments from Headquarters," "Voice of Heaven,' "'In the Bazaar," and "Wonders of Science"; in some of the other drawings there is a lamentable excess of caricature and poverty of draughtsmanship, but the general level of work is of a notable quality. Truly this lithographic work of Mr. Dyson's provides "sermons in stones," though, as we have indicated, there is not "good in everything."

BUILDING PROGRESS IN THE PROVINCES AND SUBURBS.

A LIST OF WORKS PROJECTED OR COMMENCED.

(N.B.—Local Authorities, architects, and others are invited to submit full particulars for insertion in this weekly list. Where districts are not entered against names of architects and builders the address is as a rule local.)

ENGLAND.

BUCKINGHAMSHIRE.

Amersham.—Proposed working-class dwellings, Back Lane.

CHESHIRE

Altrincham.—Council school, Prince's Road.

CUMBERLAND.

Carlisle.—Technical Institute and School of Art. Open-air school.

Cleator Moor.—Proposed working-class dwellings (£7,000).

DERBYSHIRE.

Derby.—Public elementary school, Nightingale Road (£12,000).

DEVON.

Torquay.—Villa. Mr. F. G. Moore, architect. Messrs. Atkin, Maunder & Co. (of Paignton), contractors (£950).

DORSET.

Weymouth.—Proposed Council houses, Granville Road.

DURHAM.

Durham.—Workhouse: proposed new infirmary.

Houghton-le-Spring.—Four houses, Stott's Pasture, for the Lambton and Hetton Collieries, Ltd.

Sherburn Hill.—Motor garage, for the Co-operative Society, Ltd.

Ushaw Moor.—House: addition, for Mr. M. Lough.

ESSEX.

Chignal.—Britton's Hall Farm: re-modelling, for Essex Education Committee. County architect.

East Hanningfield.—Four cottages, for Chelmsford R.D.C.

Epping.—Special Subjects Centre (£850).

Grays.—Orsett Joint Hospital: pavilion (for twenty-four beds), for H.M. War Department. Mr. C. M. Shiner, A.R.I.B.A., architect, The Gate House.

Great Dunmow.—Council School: proposed enlargement.

Manningtree.—Council school, Horsley Cross, Mistley.

Rayleigh.—Special subjects Centre (£500).

Shoeburyness.—Council school, Richmond Avenue: enlargement (£4,200).

South Benfleet.—Proposed Council school, Hopes Green.

Thundersley and West Thurrock.—Council schools (£2,900 and £2,600 respectively).

GLOUCESTERSHIRE.

Bristol.—Hospital, Novers Hill: proposed extension (£7,700). City engineer.

HAMPSHIRE.

Itchen.—Proposed isolation hospital.

HEREFORDSHIRE.

Ledbury.—Proposed thirteen workmen's dwellings, Belle Orchard (£2,800).

HERTFORDSHIRE.

St. Albans.—Children's homes, for B.G. Messrs. Mence & Finn, architects, 11 St. Peter's Street.

KENT.

Broadstairs.—Houses, Cecilia Road. Mr. A. Foster, architect, 1 St. Peter's Road.

Canterbury.—Proposed Council school, Wincheap (for 150 places).

Maidstone.—No. 57 Bower Lane: additions and alterations, for Messrs. Bishop & Bishop.

No. 41 Union Street: bakehouse, for Mr. W. G. Hougham.

Margate.—Proposed workmen's dwellings (£9,000).

Tenterden.—Proposed Council school.

LANCASHIRE.

Bispham, Little.—Two houses, for Mr. H. Leete.

Bolton.—Proposed elementary school, Bradford and Crescent Roads, Great Lever.

Lancaster.—Houses: re-construction, for the Gas Committee.

Liverpool.—Proposed elementary school in Corinthian and Stanley Park Avenues.

MIDDLESEX.

East Finchley.—Holy Trinity Vicarage: additions and alterations.

Uxbridge.—Workmen's cottages. Messrs. Lovell & Sons, contractors.

Yiewsley.—Three cottages, Wise Lane, West Drayton, for Mr. Hitchcock.

NORFOLK

Rollesby.—Two cottages, for Rev. R. J. Tacon.

NORTHAMPTONSHIRE.

Irthlingborough.—Factory. Mr. R. J. Williams, architect, Market Place, Kettering.

SHROPSHIRE.

Bishop's Castle.—Village P.M. Chapel, Asterton.

SOMERSET.

Midsomer Norton.—Proposed infants' Council school (for 120 places).

STAFFORDSHIRE.

Ipstones.—C.E. School, Foxt: improvements.

Newcastle.—Tuberculosis hospital and dispensary, for the Staffordshire, Dudley, and Wolverhampton Joint Committee (£570).

Pelsall.—Infants' Council school (for 258 places). Messrs. H. Gough & Son, contractors, Dudley Road, Wolverhampton (£3,200).

Wednesbury.—Tuberculosis dispensary (£520).

Weeford.—C.E. School: proposed alterations and improvements.

SURREY.

Banstead.—Proposed ten workmen's cottages. Mr. A. C. Williams, architect, 53 Doughty Street, London.

Croydon.—Infants' Council school, Beddington.

Mitcham.—Council school, Western Road.

Sutton.—Council school, Robin Hood Lane.

SUSSEX.

Angmering.—Four cottages, for East Preston R.D.C.

Bognor.—"The White Horse" public-house, South Bersted: re-building, for Messrs. Henty & Co.

Hastings.—Proposed central fire station, Havelock Road.

Horsham.—Nos. 62 and 63 West Street: alterations. Mr. A. E. Tutte, architect, 58 London Road, Portsmouth.

WARWICKSHIRE.

Ansley.—Three cottages, for the Ansley Coal and Iron Company.

School House: alterations.

Birmingham.—West Heath Hospital: extensions. Mr. W. H. Ashford, A.R.I.B.A., architect, 32 Paradise Street.

Hall Green.—Proposed Council school (£16,000).

Nuneaton.—Proposed children's homes, for B.G. Mr. E. E. Shepherd, architect, New Bridge Street.

WORCESTERSHIRE.

Stourbridge.—Proposed working-class houses.

YORKSHIRE.

Bolton-upon-Dearne.—Workmen's dwellings (£71,000).

Sheffield.—School Medical Department, Sims Street (£10,200).

Manor School; extensions (£4,000).

Silkstone.—Newhall Camp: hospital. Mr. J. H. Taylor, M.I.C.E., engineer, Manor House Offices.

Sowerby Bridge.—Public Baths: reconstruction.

Whitby Bridge.—Houses. Messrs. Holt & Shephard, architects, 91 Carlton Street, Castleford.

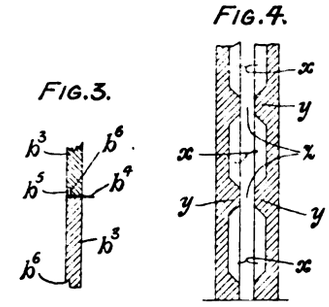
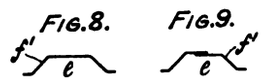
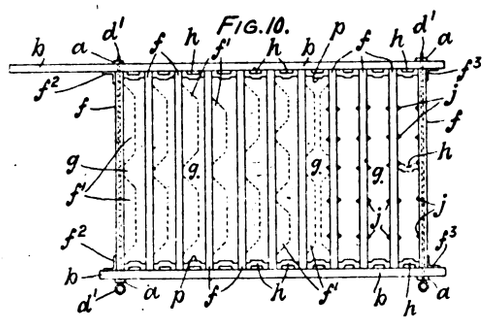
BRITISH PATENT SPECIFICATION.



Selected by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.



The first date given is the date of application; the second, at the end, the date of the advertisement of the acceptance of the completed specification.



No. 28,799. Dec. 13, 1913.—Improvements in and connected with structures of concrete and apparatus therefor. W. J. Ayles, Broughton, Stockbridge, Hants. This invention has reference to the construction of walls or buildings of concrete, wherein the concrete is moulded between boards arranged with a space between them for receiving the wet concrete, which is allowed to partly set before removing the boards. The invention has for one of its objects to provide improvements rendering serviceable for the construction from what is generally known in the building trade as "compo," which comprises a mixture of cement and sand, and which term covers wet concrete, or the like, of hollow walls in situ, and also of blocks or parts of walls or structures for the construction or building of hollow walls—that is, the improvements render the apparatus or shuttering suitable for either purpose, and also enable the various boards used as shuttering for supporting and moulding the wet concrete to be self-adjusting, so that closed and comparatively tight joints are obtained. Fig. 1 is a side elevation of boarding or shuttering arranged for building and erecting in situ from wet concrete, or the like. Fig. 2 is a plan of a wall in course of construction, with the shuttering in position. Fig. 3 is a vertical section of a detail of a corner piece. Fig. 4 is a vertical section of part of a wall provided with continuous horizontal and vertical bevelled-web parts on the inner surfaces of the hollow wall, the webs in both directions constituting hollows or recesses on the inner surfaces. Figs. 8 and 9 are sectional views of two kinds of cores for use in forming the webs with hollows or recesses between them. Fig. 10 is a plan of a mould built up from the shuttering or boarding shown in figs. 1 and 2, and held together by bolts passing through metal plates attached to the boards, such metal plates serving the same purpose when used for building in situ. Metal plates a extend transversely over the outer surfaces of the boards b, and are attached thereto by screws passing through slots a^1 in the plates into the boards. The metal plates extend beyond the longitudinal edges of the boards, and are provided with apertures c. Notches d *are* provided in the longitudinal edges of the boards for bolts d^1, which are also passed through the apertures in the projecting edges of the metal plates for connecting together the boards b used for shaping or moulding the exterior surfaces of the walls to be built, such bolts extending transversely of the wall being built, and being adapted to be withdrawn from partly set portions when the boards are removed. The notches d in the edges of one set of boards correspond with the apertures in the lower ends of the plates a on the set of boards disposed on the first-mentioned set, so as to enable the bolts passing through to engage with the notches and retain the second set in position. Cores e are employed for shaping the interior of the wall placed between the boards b. The cores are of collapsible or other construction, so that the cavities formed thereby may be varied as desired. To connect together two or more rows of boards, the metal plates a attached to different parts of the length of one of the boards b are so arranged as to correspond with the notches

d in the edges of the adjacent boards b, so that when the boards are arranged one above the other, edge to edge, the depending lower portions of the metal plates a on one board will be in line with the notches d of the boards on which the upper boards are supported. In fig. 1, with the metal plates a arranged at different distances from the ends of the boards, the ends of the boards are in line. In fig. 2 moulding boards b are shown in position against each outside surface of a wall in course of construction in situ of wet concrete. A corner or angle part b^1 is shown between moulding boards b, held together at their meeting edges by an angle plate b^2 and fastening means, and by inside moulding posts or boards b^3, provided with a plate b^4, which is secured to the upper end of the post or board b^3, and extends inwardly as shown, and is also provided with a tongue b^5, as shown in fig. 3, which engages with a corresponding notch or recess b^6 formed in the outside edges of the inside corner or moulding board next to the inside corner moulding board. The space z between the inner and outer parts of the wall in figs. 2 and 4 is that between web portions y formed on the inner surfaces of the inner and outer parts; the width between the parts of the walls where the webs exist is less than the width occurring between the parts formed with the spaces or recesses x. The width of the space z between the web portions y, and the width between

the parts where the spaces or hollow parts or recesses x occur, relatively to the thickness of the wall, are shown in fig. 4. In this figure the web portions y have angular sides. These different forms of webs are constructed by the employment of different forms of cores. Two forms of cores are shown in figs. 8 and 9, one of one piece of material, and the other of two pieces and collapsible. Where the moulding boards or shuttering are employed for making blocks or slabs from wet carbon, the boards are arranged opposite to each other, as shown in fig. 10, at a greater distance apart than as shown in fig. 2, and between these boards the partitions f are arranged at right angles thereto, and serve to divide the space between the boards into a number of compartments g. The boards and partitions are secured together by bolts passing through the apertured metal plates a on opposite boards. The spacing of the compartments is obtained by spacing members h, nibs or projections j being provided at distances throughout the length of the partitions for maintaining the spacing members h in position, and for making blocks of different widths. A spacing member is shown in dotted lines in an intermediate position at the right-hand end of fig. 10. The partitions and spacing members are held firm in position by means of angle plates f^2 and f^3, the partition at one end bearing against the angle plates thereat, and the spacing members and other partitions being tightened up against the first-mentioned partition by screws or the like (not shown) passed through angle plates f^3. Dec. 16, 1914.

Correspondence

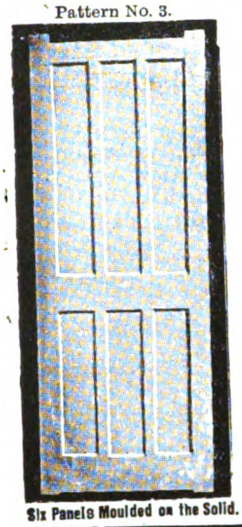
[The Editor will not be responsible for the opinions expressed by Correspondents.]

Re Recruiting for the Army.

SIR,—I should be glad if you would allow me space in your paper to bring to the notice of your readers the purpose and aims of the Architects' War Service Bureau.

Since the war started we have successfully worked as a recruiting agency, more especially for the Royal Engineers, the 2nd London Sanitary Company, and the "Artists." We are now in a position to advise men about all branches of the Service and to help them to enlist where they would be most useful.

Skilled men of all kinds are urgently needed in addition to ordinary recruits, and I shall be glad to advise all applicants if they will communicate with me, or call at 18 Tufton Street, S.W.—Yours faithfully,



ALAN POTTER,
Hon. Recruiting Officer.

January 1, 1915.

WE congratulate Sir John Cowan on the honour of knighthood which he has enjoyed for the last week. To our readers he will be best known as the managing director of Messrs. Redpath Brown & Co., Ltd., the constructional engineers. In Edinburgh he is also a prominent figure in public and especially philanthropic circles.

THE
Architect and Contract Reporter.
FRIDAY, JANUARY 8, 1915.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addresed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than* 2 P.M. *on Thursdays.*

COMPETITIONS OPEN.

BRADFORD.—March 31.—The Corporation invite competitive designs for the re-planning of streets in the central area of the City of Bradford. Mr. Reginald Blomfield, R.A., will act as assessor. Particulars may be obtained on application to the undersigned, accompanied by a deposit of £1 1*s.*, which will be returned on receipt of a *bonâ-fide* design. Mr. Frederick Stevens, Town Clerk, Town Hall, Bradford.

COVENTRY.—The City Council invite competitive sketch plans for the erection of a public elementary school at Folly Lane, Coventry. The competition is strictly limited to architects practising in the City of Coventry. Particulars of the competition may be obtained on application at the Education Office, 44 Bayley Lane, Coventry.

DONCASTER.—Jan. 23.—The Town Council invite architects to submit designs for the laying out of a site of about twenty acres at Carr House, Doncaster, and the erection of 102 workmen's dwellings on four acres thereof on Garden City lines. Copies of the particulars and conditions of the competition may be obtained at the office of Mr. R. A. H. Tovey, Town Clerk, Doncaster.

LIVERPOOL.—Feb. 8.—The Corporation invite designs for workmen's dwellings, to accommodate about 500 persons, and proposed to be erected on the site known as the Rathbone Street area. Premiums of £100, £50 and £25 respectively are offered for the first three selected designs, and the Council have appointed Mr. Henry Hartley, F.R.I.B.A., as assessor. The first premiated design will become the property of the Corporation. A plan of site, together with a copy of the printed conditions and instructions, will be forwarded to the applicant on payment of a deposit of £1 1*s.*, which will be returned on the receipt of a bona-fide set of drawings. Mr. E. R. Pickmere, town clerk, Municipal Offices, Liverpool.

MACCLESFIELD.—Jan. 31.—The Lands and Town Development Committee invite competitive plans, &c., for a housing scheme from the local architects and builders. Plans, specification, and estimate must be deposited not later than January 31, 1915, marked on the outside cover, "Housing Scheme." Mr. S. C. Baggott, Borough Surveyor, Macclesfield.

CONTRACTS OPEN.

ANGMERING.—Jan. 25.—For erection of four cottages at Angmering, Sussex, for the East Preston Rural District Council. Mr. A. Shelley, clerk, Town Offices, Littlehampton.

ASHTON-UNDER-LYNE.—Jan. 16.—For erection of Mossley Road Council School, to accommodate 600 children, for the Ashton-under-Lyne Education Committee. Deposit £3 3*s.* Messrs. Eaton, Son & Cantrell, architects, Stamford Street, Ashton-under-Lyne.

BARROW-IN-FURNESS.—Jan. 11.—For erection of permanent tripe-dressing sheds and a gut-scraping shed at the Public Abattoirs, for the Corporation. The Borough Engineer and Surveyor, Town Hall, Barrow-in-Furness.

BECKFORD (GLOS.).—Jan. 9.—For erection of six cottages at Beckford, for the Winchcomb Rural District Council. Deposit 10*s.* 6*d.* Messrs. Phillott & George, architects, Promenade, Cheltenham.

BISHOPSTOKE.—Jan. 19.—For erection of offices for 305 children on the site for Bishopstoke new Council school, for the Hampshire County Council. Deposit 10*s.* 6*d.* Mr. A. L. Roberts, architect to the Education Committee, The Castle, Winchester.

CHEADLE.—Jan. 14.—For building boundary walls and shed at the Council's depôt, Ravenoak Road, Cheadle Hulme, for the Cheadle and Gatley Urban District Council. Deposit 10*s.* 6*d.* Mr. F. R. Gibbins, B.Sc., A.M.I.C.E., Council Offices, Cheadle, Cheshire.

COLCHESTER.—Jan. 20.—For erection of tuberculosis pavilion, scarlet-fever ward, and alterations and additions to the administration block at the Infectious Diseases Hospital, Mile End, for the Borough and Port Health Committee. Mr. H. Collins, A.M.I.C.E., borough engineer and surveyor, Colchester.

COLEHAM.—Jan. 12.—For building new classrooms and making other additions and alterations to the Trinity Infants' School, Coleham, for the Shrewsbury Education Committee. Deposit £2 2*s.* Mr. W. Scott-Deakin, F.R.I.B.A., architect, 12A Pride Hill, Shrewsbury.

COMBE ROYAL.—Jan. 16.—For rebuilding a house at Combe Royal. Mr. R. B. Luscombe, The Lodge, Combe Royal, near Kingsbridge, or Mr. Geo. B. Perrott, architect, Kingsbridge, Devon.

COVENTRY.—Jan. 13.—For enlargement of the Frederick Bird Council School, Swan Lane, for the Education Committee. Messrs. G. & I. Steane, architects, 22 Little Park Street, Coventry. Send £1 1*s.* deposit to the Education Office, 44 Bayley Lane, Coventry.

DERBY.—Jan. 15.—For additions to the administrative block at the Borough Mental Hospital, Rowditch. Mr. J. Ward, M.I.C.E., borough surveyor, Babington Lane, Derby.

DEWSBURY.—Jan. 11.—For the various works required in erection of a shed at Queen's Mills, Savile Town (area roughly 9,000 super yards). Messrs. Kirk, Sons & Ridgway, F.R.I.B.A., architects, Market Place, Dewsbury.

EASTBOURNE.—Jan. 15.—For additions to the Dispensary at the rear of the Town Hall, for the Corporation. Mr. W. C. Field, borough architect and building surveyor, Town Hall, Eastbourne.

FERRYHILL.—For erection of a house, shop, stable, &c., at Ferryhill Village, Durham, for Mr. J. H. Forster. Deposit £1 1*s.* Mr. H. Moore, architect and surveyor, 39 Newgate Street, Bishop Auckland, and Shildon.

FLEETWOOD.—Jan. 20.—For roofing over the extension of fish stage at the new fish dock, Fleetwood, for the Lancashire and Yorkshire Railway. The Engineer's Office, Hunt's Bank, Manchester.

IRELAND.—Jan. 11.—For building four single labourers' cottages and one double labourer's cottage, including fencing of plots, for the Tobercurry Rural District Council. Mr. W. V. Donohoe, clerk to the Rural District Council, Tobercurry.

IRELAND.—Jan. 13.—For erection of dwellings for the working classes on (*a*) the Beresford Street and Church Street area (subject to the final sanction of the Local Government Board), (*b*) the Trinity Ward areas (Luke Street, Moss Street, and Maguinness's Place), for the Housing Committee of the Dublin Corporation. Deposit £2. The City Architect, Municipal Buildings, Cork Hill, Dublin.

IRELAND.—Jan. 18.—For erection and furnishing of National School Buildings named St. Erc's, near Dingle, co. Kerry. Dingle Royal Irish Constabulary Barrack.

IRELAND.—Jan. 28.—For the erection and furnishing of National School buildings at Foilogohig (near Banteer), Co. Cork. The District Office of Works, Cork, and Mallow Post Office.

The OTOVACUM Turbine

cleans anything and everything, whether in the Home, Office, Showroom or Warehouse. It will not, and cannot, injure the most delicate fabrics, whilst the heaviest and clumsiest articles can—no matter how dirty—be thoroughly cleaned in a few moments. The OTOVACUM Turbine has no gear belting or separating bag, takes very little power, does not require the attention of a skilled mechanic, needs only a drop of oil from time to time.

KEIGHLEY.—Jan. 19.—For erection of new office in Parson Street depôt, and for public w.c.s in Devonshire Hotel Yard, for the Corporation. The Borough Engineer, Keighley.

LEEDS.—For any of the various works required in the erection of a pair of semi-detached cottages off Pontefract Lane. Mr. F. Mitchell, architect and surveyor, 9 Upper Fountaine Street. Albion Street, Leeds.

LEEDS.—Jan. 13.—For proposed works in connection with the subway adjoining the circus, &c., York Road, for the Corporation. Mr. W. T. Lancashire, city engineer, Municipal Buildings, Leeds.

LONDON.—Jan. 19.—For erection of a sorting office at Herne Hill, S.E., for the Commissioners of H.M. Works and Public Buildings. Deposit £1 1s. Mr. E. Cropper, H.M. Office of Works, 22 Carlisle Place, Westminster, S.W.

LONDON.—Jan. 26.—For construction of an engine house, including the foundations for gas engines and pumps, the construction of culverts and connecting chambers, suction and delivery pipes, &c., and other works on the south side of the present engine house, at the Council's Isle of Dogs Pumping Station, situated on the east side of Stewart Street, in the borough of Poplar, for the London County Council. Deposit £5. The Council's Chief Engineer at the County Hall, Spring Gardens, S.W.

LUDLOW.—Jan. 26.—For erection of twenty-two cottages under the Housing, Town Planning, &c., Act, 1909, on land in Holdgate Fee, for the Town Council. Deposit £2 2s. Mr. J. Butters, architect, Ludlow.

MANCHESTER.—Jan. 20.—For the execution of general contractors' and plumbers' work that may be required in connection with the drainage of houses and other premises for a period of twelve months ending March 31, 1915. Deposit £1 1s. Mr. H. Prescott, manager of the Drainage Department, Manchester.

PONTNEWYNYDD.—Jan. 9.—For erection of a new fire station in Hanbury Road, Pontnewynydd, for the Abersychan Urban District Council. The Surveyor, Council Offices, Abersychan.

PONTYMISTER.—Jan. 18.—For erection of boys' and girls' school to accommodate 600 children at Pontymister, for the Monmouthshire Education Committee. Deposit £2 2s. Mr. J. Bain, F.R.I.B.A., County Council Offices, Newport.

PORTLAND.—Jan. 11.—For erection of playsheds at the Portland Underhill Council School, for the Dorset County Council. Mr. C. G. Bone, secretary, (Education Department, County Offices, Dorchester.

ROCHE.—Jan. 9.—For erection of new class-rooms, offices, improvements, &c., at the Roche Council School, for the Cornwall Education Committee. Mr. B. C. Andrew, architect to the Committee, Biddick's Court, St. Austell.

SEATON DELAVAL.—Jan. 28.—For erection of a police station, for the Northumberland Standing Joint Committee. Deposit £2. Mr. J. A. Bean, county surveyor, Moothall, Newcastle-on-Tyne.

SOUTHSEA.—Jan. 18.—For erection of a public elementary school in Meon Road, Southsea, for the Portsmouth Education Committee. Deposit £3 3s. Mr. A. E. Cogswell, architect, Prudential Buildings, Portsmouth.

SHEFFIELD.—Jan. 18.—For the widening of High Bridge, Penistone Road, partly in the city of Sheffield and partly in the rural district of Wortley, for the City Council. Deposit £1. The City Engineer, Town Hall, Sheffield.

SHORTLANDS (KENT).—Jan. 15.—For the construction of pumping-station buildings and other contingent works at Shortlands, for the Metropolitan Water Board. The Chief Engineer's Department, Savoy Court, Strand, W.C. Send £10 deposit to the Accountant to the Board, Savoy Court, Strand, W.C.

SUMMERSEAT (LANCS.).—Jan. 20.—For works required in alterations and additions at the Summerseat House municipal special school, Summerseat, near Bury, for the Manchester Education Committee, each section to be let separately as follows: (1) excavator, drainer, concretor, and bricklayer; (2) stonemason; (3) slater; (4) carpenter and joiner; (5) supply of cast-iron work; (6) plumber and glazier; (7) plasterer and painter. Deposit £1 1s. Education Offices, Deansgate, Manchester.

TORPOINT.—Jan. 13.—For the building of a house at Torpoint, for the Guardians of the St. Germans Union. Deposit £1 1s. Mr. F. E. Cleverton, clerk, 4 Buckland Terrace, Plymouth.

UPHOLLAND.—Jan. 30.—For erection of eight workmen's dwellings, for the Upholland Urban District Council. Deposit £1 1s. Mr. A. Hunt, surveyor, Council Offices, Upholland, Lancs.

WADSLEY.—Jan. 14.—For erection of workshops at the West Riding Asylum, Wadsley, near Sheffield. Send £1 deposit by separate letter to the Treasurer to the Board, West Riding Asylum, Wakefield. Mr. W. E. H. Burton, A.M.I.C.E., architect to the Board, West Riding Asylum, Wakefield.

WALNEY.—Jan. 18.—Tenders are invited, either in whole or separate trade contracts, for the erection of new premises on the promenade, for the Bank of Liverpool, Ltd. Mr. J. F. Curwen, F.R.I.B.A., architect and sanitary engineer, 24 Highgate, Kendal.

WARRINGTON.—Jan. 19.—For the supply and erection of six cast-iron ornamental tramway shelters at the various tramway termini, for the Electricity and Tramway Committee. The Borough Surveyor, Town Hall, Warrington.

WEST BROMWICH.—Jan. 15.—For erection of the "George Salter" Council School, Greet's Green, for the Education Committee. Deposit £1 1s. Mr. A. Long, architect, New Street, West Bromwich.

WISBECH.—Jan. 13.—For erection of sixty-four houses, in pairs, disposed as follows, for the Marshland Rural District Council—viz.: Clenchwarton, three pairs; Emneth, four pairs; Terrington St. Clement, four pairs; Upwell (Lakesend), four pairs; Upwell (Nordelph), five pairs; Upwell (Three Holes), four pairs; Walpole St. Andrew, three pairs; Walpole St. Peter, three pairs; West Walton, two pairs. Deposit £1 1s. Mr. E. A. Walker, architect, 44 Market Place, Wisbech.

WORKINGTON.—Jan. 12.—For erection and fitting up of a bathroom at Lawrence Street Schoolhouse, and for various small alterations to the premises in connection therewith, for the Education Committee. The Borough Surveyor's Office, Workington.

YNYSDDU.—Jan. 18.—For erection of mixed school to accommodate 350 children at Ynysddu, for the Monmouthshire Education Committee. Deposit £2 2s. Mr. J. Bain, F.R.I.B.A., County Council Offices, Newport, Mon.

EXTENSIVE alterations to the Express Dairy Company's chief depôt at Drayton Park have just been completed by Messrs. E. A. Roome & Co., Crown Works, Urswick Road, Hackney, under the supervision of Messrs. Young & Hall.

MR. JOSEPH HILL, of Selborne, Leigham Court Road, Streatham, governing director of Messrs. Higgs & Hill, Ltd., builders, who died on November 17 last, aged seventy-five, left estate of the gross value of £49,617, of which £28,815 is net personalty.

THE Hull Finance Committee have received the sanction of the Local Government Board to a loan of £5,049 for the construction of a boating lake near the Pickering Park, Hessle Road; £2,378 for boats, boat-houses, and machinery; £2,300 for the purchase of land for the Hull Grammar School; and £12,245 for the extension of the Hull City Asylum.

A LOCAL Government Board inquiry was held last month into an application by the York Corporation for sanction to borrow £6,200 for the purchase of land on which to erect working-class dwellings. The Town Clerk said the land in question was peculiarly adapted for the purpose, being near the centre of the city. It was forty-eight acres in extent, and the terms were specially favourable. The Board of Guardians had applied for a portion on which to erect a children's home. It is proposed to erect 220 houses of various types.

GERMAN TRADE, 1913.

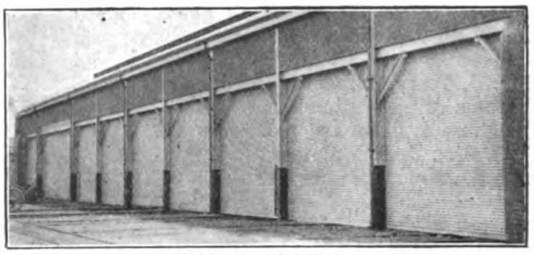
AN important report on the trade of Germany for the year 1913 by Sir Francis Oppenheimer, his Majesty's Commercial Attaché in Germany, has been published this week. From it we take the following extracts:—

General report. Quiet change of the industrial tide in 1913.—In Germany the year 1913 marked the end of another industrial wave. A quiet change of the tide has taken the place of cyclonic disturbances which characterised earlier changes. In 1913 there were no incidents resembling the catastrophes of former experiences. This tendency is the natural result of recent developments.

Growing knowledge of market conditions.—Germans, in every stage of society, are prone to combination; in Germany there is hardly a branch of manufacture or of trade, however special, which has not its own organisation and probably its own journal. Manufacturers all over the Empire, producing the same goods, are brought into touch either personally or in print. The conditions of the whole Home market are thus disclosed; its chances are weighed and scrutinised. The more a works specialises (and the tendency, owing, no doubt, to the very keen Home competition, is all towards specialisation) the more must it co-operate with, and the more has it to rely upon, other branches of manufacture; their trade conditions have to be watched in turn. The specialist is brought into contact with the outside world. News from abroad is published and carried into distant workshops. The profusion of trade and professional papers can be gauged from their catalogue numbering 300 closely printed pages. That no branch is forgotten may be gathered from the fact that there figures among them a fortnightly magazine dealing with the interests of the foremen of platelaying gangs on the Prussian State railways (founded in 1906). The keen competition among trade papers has produced a high standard. Much ingenuity and care is spent upon the reports of the industrial weather, with the result that no man need be taken unawares by a change of the tide.

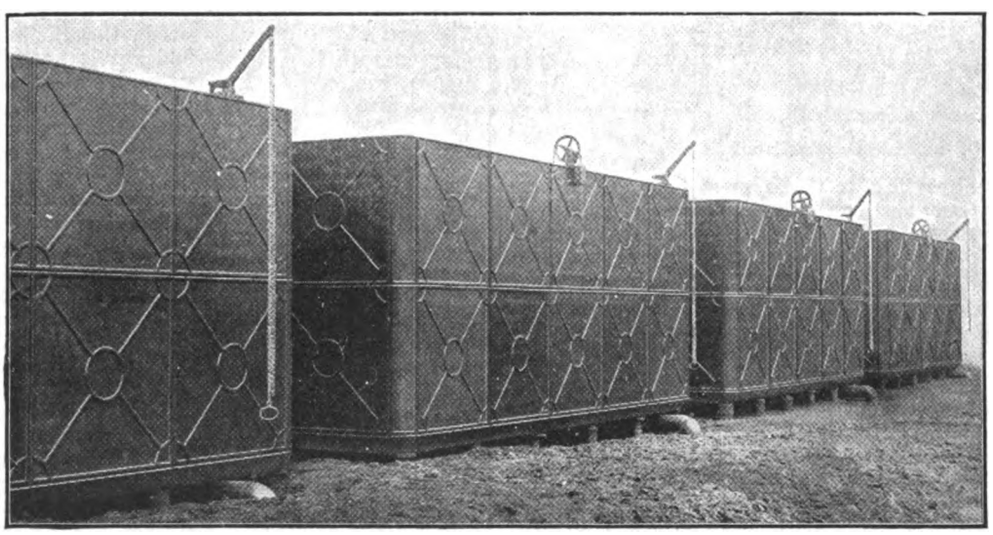
This education has been assisted by a widespread tendency to speculate in industrial shares. Quotations are watched and markets are studied. Even those in a small way of business have acquired a certain aptitude in reading the industrial barometer.

Money market.—In 1913 the reading of the times was comparatively easy. In connection with the Prussian issue to the general public of 350,000,000 marks of 4 per cent. Treasury bonds at the end of January 1914, there was revealed an apparently unprecedented abundance of money. The ease of the money market, though then not quite in keeping with the seventy-fold applications for that issue, was nothing short of sensational. If it showed that the precautionary measures had been effective, it proved also for the first time how colossal the totals must have been which had been hoarded during the European troubles in 1912. Of course, the change of the industrial tide had in the meantime freed enormous amounts; not only had manufacture been reduced, but the prices of some of the most important raw materials had sunk conspicuously.



The favourable condition of the money market early in 1914 has been fully confirmed by subsequent events. The management of the Imperial Bank, which had often during recent years been taunted as over-prudent, is to-day unreservedly applauded. Amid international financial perplexities the German money market stands solid and serene. Germany's political retreat over the Morocco question has ended in a great financial victory.

Syndicates.—Once the change had come, syndicates exercised their usual steadying influence. This side of syndication has repeatedly been explained. Syndicates control production and sales, and, when the Home market is satiated, help towards directing merchandise abroad. In an atmosphere of industrial depression syndicates are seen to their greatest advantage—at least by their members. It is, then, not surprising that in 1913, and to a greater extent in the early months of 1914, syndication—the renewal of old syndicates and the foundation of new ones—should have been one of the most frequent subjects discussed in the commercial Press.



There is no doubt that after each successive boom the desire for syndication is strengthened, and at the same time its accomplishment is rendered more difficult. The

desire is strengthened because every boom gives the members of the various industries a chance of extending their works and raising their capacity of output—which means an increased production and in consequence an increased competition during a slump. In the first quarter of 1914 prices of unsyndicated goods reached what seemed to be the lowest possible limit. Mixed coal and ironworks were known to sell their finished iron produce below cost price, because the sale of coal was leaving them a profit. Even among syndicated industries there were sales below syndicate prices—a practice which does not appear to be unknown also during more prosperous days. Yet the cry for syndication became louder as the depression progressed. Though the works of the finishing industries were being kept going at a loss, not one among them seemed inclined to curtail manufacture, as such a decision was likely chiefly to benefit competitors. A number of finishing industries declared with quite a novel enthusiasm that syndication was their only salvation, and began, perhaps for the first time, serious efforts to accomplish it. Yet the negotiations have been greatly delayed by the conflict of the many interests involved. The formation of one syndicate is made dependent upon the formation of some other syndicate, so that none of the necessary preparations are allowed to proceed beyond a certain point.

The difficulties of syndication are augmented, because every boom gives a further advantage to the giant works which have virtually concentrated the various stages of manufacture under one roof. They have little interest in the various syndicates controlling the respective stages of manufacture unless they are granted preponderant figures of participation, more especially in the final stages. The formation, early in 1914, of the Tube Syndicate was, at the eleventh hour, frustrated by one of the giant concerns demanding such an excessive figure of participation. As the smaller works, whether syndicated or not, are greatly at the mercy of these giants, they naturally prefer a state of syndication which guarantees their existence, checks competition, secures steady prices in the Home market, and provides export bounties for foreign orders. For the giant concerns, syndication means financial sacrifices; but these sacrifices are expected of them as they are the princes of industry, the pillars of Germany's economic life. Their concerns have become world concerns. They embrace so many branches of manufacture, they command so many markets, that they reach above local industrial tides. When the tide in Germany changed, the Gelsenkirchen Works, to mention but one characteristic instance, secured a contract for iron tubes in South America of 65,000 tons, representing a value of 9,000,000 marks.

Concentration.—The rise of such works, although it has been greatly assisted by the modern developments of German banking, is chiefly due to the application of science to manufacture. These leaders have increased their profits by carrying the science of by-products to its utmost limits, and they have thus very materially reduced their cost of production. They are both indefatigable and generous where scientific research is concerned. The Emperor William Institute for the Scientific Exploration of Coal is the latest proof. A German society for the study of ores is similarly in course of formation. A succession of booms has made these mammoth concerns financially independent—in Rhenish Westphalia some of them have ended by financially assisting the banks to which they had originally owed their own phenomenal rise. Their financial resources enable them to add new branches of manufacture to those they already control. They are continuing their steady process of concentration, each step of which leaves them further fortified. The recent boom has produced new and noteworthy concentrations—e.g., the Mannesman Tube Works have absorbed the important sheet-iron works of Schulz-Knaudt. The speech in which the chairman of the Mannesman Works recommended the amalgamation to the shareholders is so characteristic of the general trend that some of his arguments deserve to be repeated. The chairman assured the shareholders that the Mannesman Works were not pushing towards aggrandisement, but were driven to it. The advantage which the works had acquired in the tube market must disappear if the necessary raw iron had still to be bought at high syndicate prices from the very works of a mixed character which were more and more becoming competitors in the tube market. Efforts had been made to secure special terms for the delivery of raw iron in accordance with the importance of the orders which the works had to give—but there was little inclination to negotiate. However, even so, a cheap supply of raw iron was not all that was required to secure the advantages of a mixed works. They must eventually control a complete line of production—coal, blast furnaces, steel works and tubes—to exploit every possibility of cheap supplies. The development of the Mannesman Works is moving from finished article to raw material—in direct opposition to the development which has taken place in most of the other great works.

The financial power to which the large works have attained is also increasingly used for acquiring their own means of transport, because all the world over the item of transport is gaining an additional importance in the faculty of competition. During the year under report a number of works in the heavy industries have combined with shipping concerns. The example had been set by the Gelsenkirchen Works and the Deutsche Kaiser Mining Works, which own Rhine fleets of their own. In 1913 similar steps were taken by the Gutehoffnungshütte, Koenig Ludwig mines, Concordia, Constantin der Grosse, &c. It would appear that 1914 may see even a greater number of similar mining-shipping combinations. To prevent a final syndication of Rhine shipping (for which these combinations were believed to be only the introduction) various German Governments have deemed it necessary to secure a preponderant and timely interest in large Rhenish shipping concerns.

The most recent development in the matter of concentration is perhaps the most interesting of all. To guarantee a steady sale of their vast output some of these big works have begun to effect a financial combination with their own consumers, thus following on an extensive scale an example set by the electrical industry. An important works manufacturing machines for use on railways has bought up a company letting out railway machinery (the shares of which it bought for £100,000); the firm of Krupp has bought up two shipbuilding yards; a leading factory producing electrical appliances and machinery has obtained control of an electrical power supply company (capital, £400,000), &c.

These gigantic concerns (of which every industry boasts increasing numbers) exercise a steadying influence upon the country's economic life because their interests are world interests. Whatever the industrial tide may be at Home they are vast employers of labour; in many communities they are the backbone of local finance; together they contribute colossal revenues to the public funds. Recently two giant combinations in the banking world brought the Exchequer (by way of taxation) a windfall of over £1,000,000. It is not unnatural, then, that such concerns obtain facilities from the Government which would be denied to the smaller fry. These privileges in turn strengthen their position and give them an additional lead.

Difficulties of Building Trade.—Industrial demands upon the money market are, of course, greatly responsible for the quick rise and the high level of the German bank rate. To that extent they are answerable for the calamities of the building trade. Speculative builders cannot obtain the necessary mortgages or advances at rates which would still yield a profit. For years speculative building has been at a standstill, and thereby employment in all dependent industries has been seriously affected.

It is then not surprising that in a number of towns the scarcity of dwellings should have become a public calamity. As might have been expected, the dearth of workmen's dwellings (one to three rooms, including the kitchen) is greatest. The census of habitations undertaken at the end of 1912 showed, *e.g.*, that the empties of all such smaller dwellings in the following towns amounted to:

	Per Cent.
Freiburg	0.3
Bremen	0.5
Dresden	0.6
Strassburg, Bielefeld	0.7

As a natural result these small dwellings show comparatively the highest increases in rent. On April 1, 1913, which is a popular quarter day in Germany, workmen's families in various parts of the Empire had to be housed in public buildings, schools, and barracks, because no dwellings were available.

The statistics of the German mortgage banks are instructive in this connection. In the year 1911, as in the preceding years, they had issued bonds amounting to an annual total of 515,000,000 marks; in the year 1912 the sum was reduced to 207,000,000 marks; in 1913 to 41,000,000 marks. Correspondingly they had increased the amount of their mortgages in 1911 by 572,000,000 marks; in 1912 by 219,000,000 marks, but in 1913 by only about 5,000,000 marks. Several municipalities found themselves compelled to open mortgage funds—from which to grant at least the most urgent, and chiefly second, mortgages.

Digitized by Google

In the building trade there were in 1912-13 for every 100 places the following number of applicants:—

	1912.	1913.
January	459	531
February	358	383
March	161	262
April	144	198
May	143	212
June	130	185
July	139	198
August	148	219
September	129	164
October	163	228
November	233	437
December	297	543

Whatever building there was concerned chiefly factories and public buildings (municipal buildings, railway stations, &c.). The failure of the building trade, of course, affects almost exclusively male adult labour.

CALENDARS. DIARIES. ETC.

FOR many years past we have looked forward to the receipt of the now widely used blotting-pads issued by Messrs. Hudson & Kearns, of Hatfield Street Works, Stamford Street, S.E. The publishers wish to call special attention to the No. 8A pad, which, we are informed, is recognised by most of the leading commercial houses as the "Business Man's Blotting-pad." There are numerous other sizes, and Messrs. Hudson & Kearns have quite rightly obtained an unrivalled name for these useful, or rather indispensable, appointments for the office desk.

MESSRS. WATERLOW BROS. AND LAYTON, LTD., have, as usual, brought out their valuable "Architects' and Surveyors' Diary and Price Book," and sell it for 3*s.* 6*d.* and 6*s.* according to diary space and binding. The 1915 edition keeps abreast of the times, and includes such new matter as the Building Regulations for Public Elementary Schools and a table of discounts, as well as changes of *personnel* in the official world. The section setting forth such prices as may be particularly useful to architects, builders, &c., occupies some twenty closely printed pages out of the 420 which make up the reading matter as apart from the Diary. It will be seen, therefore, that the book constitutes a miniature professional business encyclopedia, and is indispensable independently of the purchaser's tenacity as to daily diary entries.

FROM the London and Lancashire Fire Insurance Co., Ltd., we have received an unostentatious wall calendar and a small memorandum block giving a page to each day of the year. The latter, too, is meant to hang, for if used as a desk pad the pages are apt to loose their trimness.

MESSRS. HAYWARD BROTHERS & ECKSTEIN, LTD., combine a comprehensive catalogue of their building specialities with a diary. The latter is by no means formidable, for the six working days go to a single page.

THE Calendar of Messrs. Merryweather & Sons, Ltd., might almost be called sensational, for it depicts a great castle in flames, while a motor fire engine, motor tender, motor escape, and a fire boat are busy at the foot of the blazing pile. We notice, by the way, that both the escape and the engine are labelled "Leicester Fire Brigade"; but we do not recognise the castle.

MESSRS. ROBERT BOYLE & SON, 64 Holborn Viaduct, E.C., again issue their neat 3-inch scale calendar. And with it come illustrations of Boyle's latest patent "Air-pump" ventilator, design No. 175B, and Boyle's latest improved air-inlet bracket, design No. 245B, which, though but slightly less ornamental than their catalogued designs Nos. 175 and 245, are equally as effective and well made, and substantially lower in price. It is worthy of note that the "Boyle" system of ventilation has been successfully applied to more than 300,000 buildings.

MR. WM. HENRY FORDE, of 56 Grosvenor Road, Claughton, builder and contractor, left £61,817.

GEORGE FOX, of Dagenham, East Ham, of Messrs. Fox & Sons, builders and contractors, has left estate valued at £30,210, of which net personalty is sworn at £1,238.

AT the monthly meeting of the Barrow Town Council, it was reported that the Carnegie Trustees had agreed to increase their gift of £12,000 to £13,000 for a new Free Library for Barrow. Contracts were let for new gasworks at Barrow to the extent of £35,000. Other contracts are under consideration.

VARIETIES.

KIRKCALDY District Committee have decided to accept the offer of Messrs. Macfarlane, Strang & Co., Ltd., Lochburn Ironworks, Maryhill, Glasgow, for one of the Glenfarg water works contracts. Their offer was £20,750 7*s.* 3*d.*

MR. JOHN BROWN CORRIE, of Sheffield, of the firm of Messrs. J. B. Corrie & Sons, plumbers and sanitary engineers, a former president of the Sheffield Master Plumbers' Association, who died recently, left estate of the gross value of £33,907, of which £31,057 is net personalty.

LARGE extensions are being carried out on the "Kahn" system of reinforced concrete at Messrs. Vickers' Factory, Crayford, Kent, the cost of which will amount to about £18,000. The general contractors are Messrs. William F. Blay, Ltd., Railway House, Dowgate Hill, E.C.; and at Dartford.

THE Wednesbury Town Council on Monday last agreed that application be made to the Local Government Board for sanction to borrow £5,240 for the provision of twenty-four dwellings under the Housing of the Working Classes Act; that a purchase be made of 9,920 square yards of land in Hobs Hole Road for £600; and that a contract be entered into with a local firm of builders for the erection of twenty-four houses thereon for £4,320, in accordance with plans already approved.

THE Board of Education recently approved an additional expenditure of £1,000 on the erection of the Dover County School for Boys, and the contract has been signed by Messrs. H. G. Denne & Son, of Deal. The amount of the contract, after providing for extra payment in consequence of the war and for the reinstatement of omissions, is £13,584 8*s.* 6*d.*, being just within the sum of £13,585 approved by the County Council. The Committee have agreed that the contractors shall not be held liable for any damage that may be done to the building during the period of the contract through hostile acts by the enemy during the present war.

THE Coventry Photographic Club, which has undertaken, at the request of the Public Library Committee, a survey of ancient and other buildings, and a reproduction of old prints relating to the city and district, opened another exhibition of photographs on the 4th inst. in the clubrooms, Little Park Street. The present exhibits constitute the fresh work done since a display was made nearly two years ago, and the total is now 212. Certificates to the following: S. Loveridge, for "Apple Store-room, Charterhouse"; P. H. Wenham, "St. Mary's Hall State Chair." "Mantelpiece in Oak Room," and "Corley Church Interior"; H. W. Bush, "St. Mary's Hall Handrail Terminal" and "Bablake Old School Kitchen Fireplace"; A. H. Tompkins, "Bond's Hospital Armchair"; G. O. Seymour, "Cook Street Gate"; P. L. Lainbow, "Tantara Stile, Stoneleigh"; A. L. Hitchen, "Godiva Procession, 1897."

A LOCAL Government Board inquiry was held last week into the application of the Truro City Council for sanction to borrow £24,300 for sewerage and sewage disposal. There was no opposition. Twelve years ago a similar inquiry took place, but the Council have not yet received the Board's report. The crude sewage has therefore continued to be discharged into the local tidal streams. According to the new scheme, as explained by Mr. F. A. Barnes, the City surveyor, it will be treated in tanks under an ordinary settlement system.

THE Birkenhead Water Committee have accepted, subject to the consent of the Council, the amended tender of Messrs. Robert McAlpine & Sons, amounting to £80,255, for the construction and laying of the portion of aqueduct in connection with the proposed Alwen water supply to Birkenhead from a point near Llanfihangel-Glyn-Myfyr to the site of the works at Cerrig-y-Druidion, including the purchase of the necessary pipes. The accepted tender of the Staveley Coal and Iron Company, Ltd., near Chesterfield, for cast-iron pipes amounts to £97,858; Messrs. Stewarts & Lloyd's tender for steel pipes amounts to £15,123; and Messrs. Blakeborough & Sons, of Brighouse, for the supply of valves, have tendered £4,574. The committee have also accepted the tender of Messrs. Firth & Co., of Derby, amounting to £53,106, for the construction of the portion of the aqueduct between Llanfihangel-Glyn-Myfyr and the Bwlch tunnel; and also the tender of Mr. J. Riley, of Cheltenham, for £42,440, for the construction of the aqueduct between the Bwlch tunnel and Connah's Quay, including the Mount Pleasant tanks.

Monday, January 25.

Architectural Association : Paper entitled "Some Architectural Thoughts at the Present Time," by Mr. L. March Phillipps, at 8 P.M.

LESSONS FROM THE ENEMY.

THINGS after this war are not going to be the same as before; in fact, we may even say that at the present moment things are not the same as they have been. It rests wth us, and with all of us, to determine whether they are to be better or worse. "Business as usual" is an untenable proposition. It is not, and never will be again, "as usual." We cannot revert to the *status quo ante*. In order that we may ensure that the future may be better than the past, it behoves us to exercise forethought, and determine what our course must be to bring about improvement. In this course we may do well to learn lessons from the enemy.

The most outstanding feature of our enemy's activities has been, without question, Germany's preparedness for a sudden and vigorous employment of all her resources for an energetic initiative in the confidence of a speedy victory. Those resources may not—and we trust will not—be sufficient for the attainment of her purpose, but that preparedness has, we must admit, given her the balance of advantage up to the present. She is in possession of Belgium and of no inconsiderable portion of the lands of our Allies, France and Russia. To deprive the enemy of that possession will, under modern conditions of warfare, be a difficult and costly operation, and we are not yet ready to undertake it because we are only now beginning to make our preparations.

For the state of things after the war it is not too soon, and we should start at once to make our preparations. When peace arrives Belgium will have very largely to be rebuilt. What preparation should our architects, our builders, our manufacturers, our merchants make that they may be ready to take a part in the rebuilding of Belgium? It will be essential that the work of rehabilitation shall be speedy, and to as great an extent as possible inexpensive. It will be too late to begin preparations for this end when the opportunity is knocking insistently at the door.

Architects must make their preparations now. Obviously the first step for those of them who hope or intend to take a part in the work is to acquire a knowledge of technical French and Flemish. For this purpose advantage might well be taken of the presence in this country of Belgian refugees, thus fulfilling a double purpose in helping those who learn and those who teach. Next must come an acquaintance with the conditions of living, the requirements of those who are to be housed and the materials that are available. Then designs can be made and drawings prepared which will be intelligible to those who are to carry them out. It will probably be necessary for the architects to contemplate the possibility of having to act as their own clerks of works, to personally superintend the carrying out of their designs. It has already been suggested that the complete destruction of many villages and towns in Belgium will provide opportunity for the introduction of garden-city principles in their reconstruction or replacement. If such introduction is to materialise, the schemes must be prepared in advance. There will be no time for them after peace is declared. The people of Belgium will want new homes at once.

Our builders may also make their preparations for the future. It is scarcely likely that the Belgians will after the war possess the resources or the organisation for speedily carrying out the necessary work of rebuilding their devastated homes, and the assistance of British contractors will probably be warmly welcomed. But in order that it may be prompt and effectual preparedness is essential.

So, too, must our manufacturers of building material exercise forethought, and be prepared for immediate supply. They must not suppose that their present stocks will suffice either in quantity or in kind. They must follow the example which is being set by manufacturers in other goods who have taken up the work of supplanting German and Austrian productions in neutral and Colonial markets, and be prepared to supply their prospective customers with the articles that these latter desire, and not to endeavour to force upon new markets their past fashions

Our merchants must make their arrangements to act as intermediaries between the manufacturers and the ultimate customers. They must lay themselves out to quote prices c.i.f. promptly and accurately, and not to be content with quotations f.o.r. or f.o.b. It goes without saying that these quotations must be in metric quantities and Belgian coinage, and in terms easily adaptable to the rate of exchange which may be current when peace is declared. Above all, the manufacturers and merchants must advertise their preparedness and acquaint architects and builders with their readiness to supply material that may be needed, and must take full advantage of the professional Press for that advertisement.

In this matter of advertisement our manufacturers and merchants have much to learn from those of Germany. During the last few years our building trade has been flooded with German manufactures and German inventions, and their representatives have been amongst the most extensive occupants of the advertisement columns in our own Journal and in our contemporaries. The strong grip of the building trade and the architectural profession which German-invented specialties have attained has not

Digitized by Google

GARDEN ORNAMENTS.—CIRCULAR FOUNTAIN AT PETWOOD, WOODHALL SPA.

in many cases been due to the excellence of those inventions or the superiority of German proprietors, but to the true business instinct of German proprietors in giving to their wares bold advertisement. We need hardly say that the German origin and the German proprietorship of these wares have in many instances been cleverly concealed.

This exploitation of advertisement is but one outcome of another German trait, for, in addition to preparedness, we have as one of our enemy's characteristics that of thoroughness. The thoroughness of his cruelty, his "frightfulness," his "ruthlessness," is paralleled by that of his business methods, and here again we may learn from the enemy. The British working man often regards his employment as primarily a means to an end—so many hours' work each week to be rewarded by so many shillings in his pocket at the week-end, to be spent on not only satisfying his necessities, but on increasing his pleasures. The German treats his employment also as his hobby, takes his pleasure in his work rather than in his play. This makes for efficiency. A problem which lies before our manufacturers and our employers in the building trade is how to increase the interest and the pleasure of their workmen in their work. To some extent the war is infusing this spirit. The men who are preparing war material must feel that the man who handles the bolt and the rivet is helping in the fight as truly as he who handles the bayonet and the rifle.

We want more of this spirit, which must develop in ourselves a characteristic that marks in every phase of life the operations of our enemy—the principle of mutual help. Our whole industrial life should be permeated by the patriotic feeling that the exercise of our best efforts in our own particular sphere is a gain for our country, and reflectively of ourselves as a part of that country. We should feel that we cannot benefit the community without also benefiting the individual. When we undertake the rehabitation of Belgium we shall benefit, not only the Belgian, but the Briton.

Mutual help and united national effort have been strongly marked in the peace activities of our enemy as well as in war-time. The Government has assisted in every possible way the inventor, the manufacturer, and the trader. More particularly the credit of the nation has been the credit of the individual. Any inventor, any trader with good character and a fairly sound business proposition, has received the financial support and the capital he needed from the Government and the great banks. How different it has been with us! More and more it has become the general experience that with the growth in size and importance of our great joint-stock banks it has become increasingly difficult for the manufacturer and the trader to obtain financial support, except by the deposit of gilt-edged securities. Nay, more; it is fairly obvious that our banks have used the monies of their depositors, not to assist their customers, but to finance the enemy's banks and enable them to finance our commercial rivals.

This is a state of affairs that must be remedied, and we look to the Board of Trade, as the Government department most immediately concerned, to see that our banks are brought to heel. It is the credit of the nation that enables the banks to carry on their business, and the Government must see to it that the national support given to the banks must by them be extended to their customers.

We are all aware of what the Government is doing for the dye-manufacturing industry. We all know that the Board of Trade is making an endeavour, not perhaps in quite the wisest way—more from want of knowledge than from lack of good intention—to assist in the capture of enemy trade, and we may hope that financial support will be given by the Government or by the influence of the Government to the building trade, which, with its multifarious ramifications, is still the greatest industry in the country.

One more lesson we may learn from the enemy. His Government has given their manufacturers and traders a great advantage over the Britisher by cheap freight, partly by the development of State-owned railways, but vastly more by the establishment of an admirable system of water-borne canal traffic. This particularly affects the building trade, the traffic for which is largely bulky and indifferent to speed of delivery, therefore particularly suited to water carriage. The Government have for the defence of the realm taken control of our rail-

Digitized by Google

GARDEN ORNAMENTS.—THE WARWICK VASE AT WARWICK CASTLE.

ways without any murmur on the part of the public or the shareholders. Without fuss or noise, our railway system is now nationalised. Why should it not continue to be nationalised in the interests of trade?

NOTES AND COMMENTS.

We have been much interested in a pamphlet on the Reorganisation and Extension of British Trade by Mr. Percy A. Reuss, which deals with the proposed formation of a public company for the exploitation—we might, perhaps, better say advancement—of British manufactures in foreign trade. This proposal emanates from a preliminary "Committee for the Expansion of British Trade" formed in Sheffield; but we hope the idea will be expanded into a national concern—not necessarily governmental—as it seems to us to contain many of the germs of the commercial organisation that has been so potent a factor in German mercantile expansion. We have not space at present to deal fully with the subject, but shall return to it on a future occasion.

The collection of cartoons, drawings and paintings made by Alfred Stevens for the projected decoration of Dorchester House, and now on view at the Tate Gallery, gives us the fortunate recovery of long-lost treasures, and affords still further evidence of the greatness of the master, of his power in composition, his sense of rhythm, his prodigality of invention. For all who value in any degree the intimacy of architecture, sculpture, and painting, their study is an imperative duty.

The declaration which has gone the round of the daily Press made by Canon Alexander, treasurer of St. Paul's Cathedral, that "fire experts say that St. Paul's can now be regarded as being as safe as it can be made," depends for its value on the reliability of the "fire experts," whose names are not quoted. There is a certain amount of reservation, for example, as regards the prevention of fire. It is stated that "all the woodwork which it has been possible to remove has been removed." The possibility clearly does not extend to the organ, the choir stalls, and other fittings, so there is still considerable risk of a fire starting. The worthy Canon's satisfaction is evidently to a considerable extent based upon the manner in which an attack from without—which was a very serious probability, as we have before pointed out—has been provided against, but we hope that internal dangers have likewise been recognised and adequate provision made for combating them.

We have already noted the inception of a movement in Dublin for the manufacture of glass in Ireland. We are pleased now to learn from the *Irish Times* that all preparations are complete for inaugurating in Dublin a factory for the purpose. The details of the project have been carefully worked out, and a scheme has been compiled by Messrs. Gustave Peeters and Leon de Ridder, Belgian refugees at present in Dublin, who have a life-long experience in the industry in Antwerp and other parts in Belgium. These gentlemen have been carrying out, for the past few weeks, tests and experiments with regard to Irish sands and limestone in the laboratories of the Royal College of Science, which have been kindly placed at their disposal—and every assistance given to them—by the Department of Agriculture and Technical Instruction. The results of these tests have proved eminently satisfactory.

M. Peeters lays stress on all the advantages which Ireland presents for such a scheme. "The Irish sands," he states, "are clearly superior to the Belgian ones, and as a general rule all the materials are absolutely satisfactory for producing sheet and plate glass of the very first quality, and this at a lower cost price than in Belgium, France, or Germany." He also points out that we have now more facilities to procure Belgian skilled labour to teach our workers than we will ever have. As regards himself, M. Peeters modestly states that he had been a simple working man in the factory where his father was an administrator, called Les Glaces de Roux, in Charleroi-Roux. Before the war they had two mirror factories in Belgium, one managed by his brother at Ghent, and the other by himself in Antwerp. His opinion, therefore, on the project is extremely valuable.

The opinion of M. de Ridder, who is an analyst, is also worth quoting. He says: "The Irish sands on

Digitized by Google

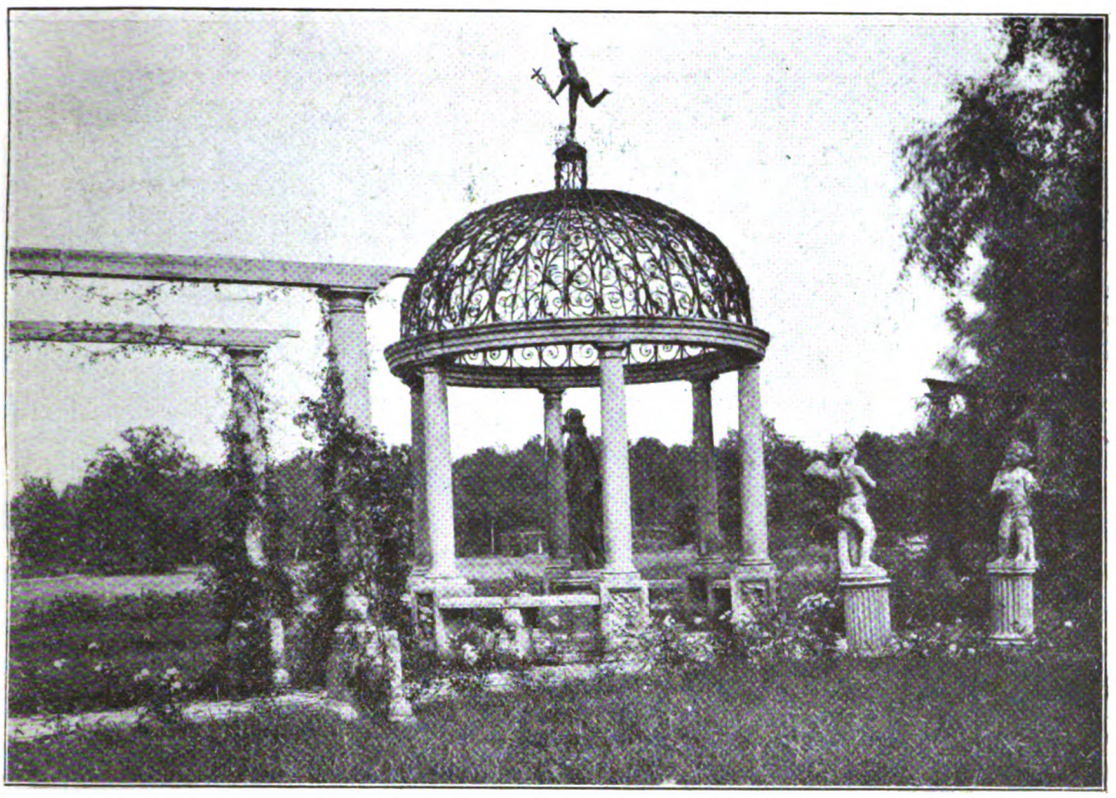
GARDEN ORNAMENTS.—IN THE GARDENS AT PETWOOD, WOODHALL SPA.

which I have made experiments, in conjunction with M. Peeters, are suitable for the manufacture of the very best kind of sheet and plate glass. I consider even that these sands will allow us to make glass of a better quality than the Belgian glass at a smaller cost. I can state the same as regards the Irish limestone we used for this purpose." M. de Ridder has been technical supervisor of the factory of M. Peeters, and he has had similar experience in a chemical and medical glass manufactory in Chicago.

Doncaster is to be added to the list of towns wherein the local traders, particularly those dealing with electrical fittings, are up in arms against the competition threatened by the Corporation, who, it appears, are seeking powers to supply, not only electric current, but also fittings.

The war has brought so much increased industrial activity to Birmingham that the Council are in a difficulty. They are building a new electrical power-house, which will be available for a supply of current by the winter of 1916-17, and had intended to install temporary plant for 5,000 kilowatts, but now find a demand for 11,000 kilowatts. In spite of some opposition on the ground that this increased demand would be only temporary and cease with the end of the war, the Council has wisely, we consider, decided to make their temporary installation for 10,000 killowatts. The war profits of Birmingham manufacturers will enable them easily to make a contribution to the city funds to cover the predicted loss of £10,000.

Manchester is to have next spring an exhibition of Franco-British war pictures, which will include the work of some of the leading painters of Great Britain and France. Its formation has been entrusted to Mr. A. G. Temple, the Art Director of the Corporation of London, who, in view of the nature of the exhibition and the important part that Manchester is playing in the present war, has placed his services gratuitously at the command of the Manchester Corporation. The Ministry of Fine Arts in Paris has also intimated its readiness to assist in any way in its power.



The subjects of the pictures will include the chief wars in which this country has been involved from Elizabethan times down to the present day, and will also cover the Napoleonic campaign against Prussia and the Franco-German War of 1870.

The present European war will be illustrated by views of cities and buildings in Belgium and France which have been destroyed or imperilled by the Germans; by pictures of the British Fleet by marine painters of the day, and by certain works of military interest which have been specially painted for the exhibition.

The artists represented will include Meissonier, Detaille, Robiquet, De Neuville, Boulanger, Boutigny, Grolleron, Flameng, Doré, Rochegrasse, Lady Butler, Seymour Lucas, Herkomer, Watts, Collier, W. W. Ouless, Sargent, Vicat Cole, Wyllie, Norman Wilkinson, Andrew C. Gow, Ernest Crofts, John Charlton, Caton Woodville, Lucy Kemp-Welch, and C. W. Furse.

The association between the Church and art is a favourite topic of the clergy, and is besides a reality even to-day to some extent, if not to so far as in mediæval times. The Rev. F. T. Woods, Vicar of Bradford, delivered a lecture to the members of the Bradford Arts Club, part of which may be admitted as generally true, though he would find few to agree with him in his views as to the effect of the Renaissance and later art movements. The Vicar said the Church's relationship with art was of necessity close and cordial, and it was not surprising that art should be the handmaiden of religion, because art was connected and concerned itself with the essential parts of our nature. It was the function of art to satisfy man's craving for beauty, and delight in colour, shape, and sound, and not only to satisfy the craving but to guide it in sane and proper channels, to make it not merely a craving but a cultivated taste. Art was essentially spiritual. It dealt with feelings and emotions, and with things that could not be reduced to terms of the material. It was the function of art to provide what was so eloquently described in the immortal allegory of "The Pilgrim's Progress," an interpreter's house. The Church had always taught that Nature is the art gallery of God, provided for the delectation of man. If that was

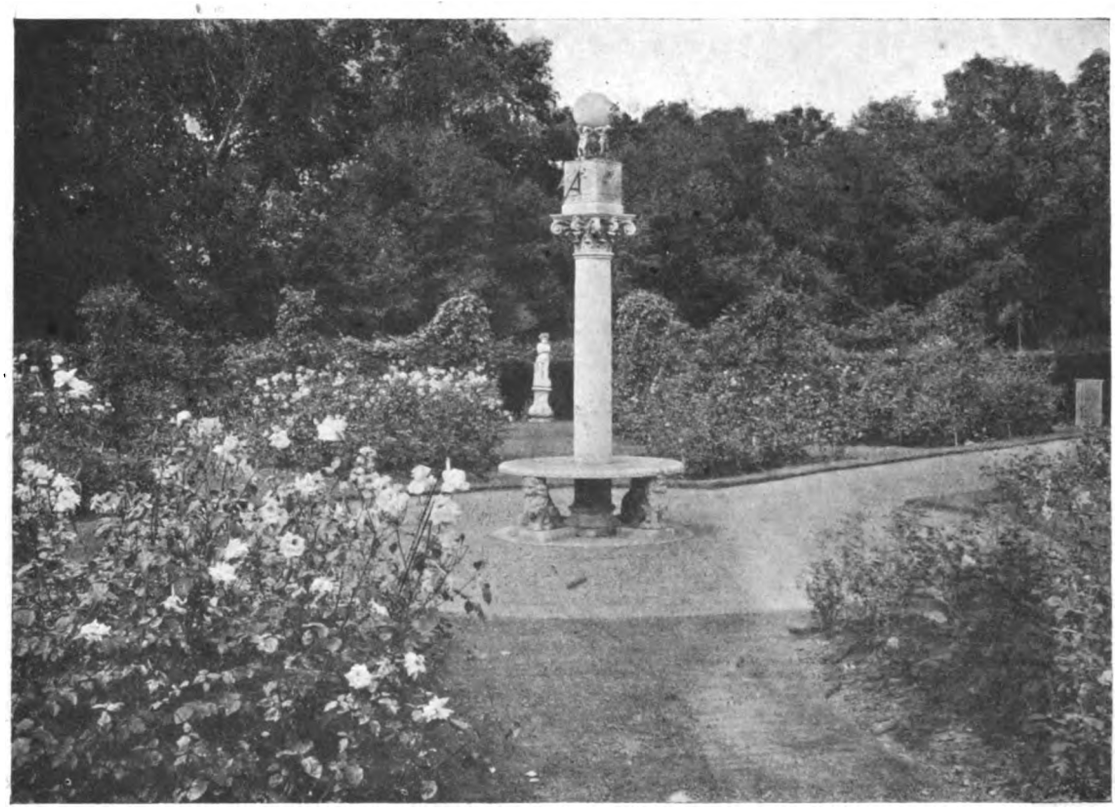
Digitized by Google

GARDEN ORNAMENTS.—ARBOUR IN THE GARDENS AT PETWOOD, WOODHALL SPA.

so, then surely it was the high ministry and holy function of art to interpret these pictures to man. The Vicar traced the association of the Church and art from the beginning of the Christian era down to the golden age of art in Church life. Speaking of the Renaissance, he said that, unspeakably beneficial as it was in many ways, yet from the point of view of art it was little short of disaster.

ROYAL ACADEMY WINTER EXHIBITION

IN keeping with the times, the winter show of the Royal Academy is this year a "War Relief Exhibition in aid of the Red Cross and St. John Ambulance Society and the Artists' General Benevolent Institution." True that a third of the price at which the pictures and pieces of sculpture are offered for sale is in most cases to go to the artists; there is in this no reflection upon their charity, which is marked also by the general fixing of prices at what must be considered as war prices.



The most striking feature of the Exhibition to our mind is that the works offered for sale are eminently pictures and sculptures to be lived with. The great canvasses and colossal groups that are only suitable for large galleries and public ownership are absent. Another notable point is the catholicity of the collection. It is not a typical Royal Academy Exhibition marked by the absence of work of younger men of "advanced" views and impatient of Academical propriety. It may be said, perhaps, that all the exhibitors have not given of their best or of their most characteristic work; but there are sufficiently daring productions that would have scarcely ventured to seek, and would almost certainly not have found, acceptance in a regular summer exhibition of the Royal Academy.

Naturally there are several topical pictures, such as Mr. John Lavery's "The Green Park, December 1914," with its tents and cavalry, but more to be esteemed for its appreciation and rendering of London's own delicate blue-grey haze, characteristic of its winter atmosphere. Next to this hangs Mr. Walter Sickert's "The Integrity of Belgium" a "plein air" battle picture notable for its fine expression of movement. Mr. Sargent's "Rialto" in the same room (gallery III.) is one of the most notable pictures in the Exhibition, with its brilliant study of dazzling sunlight and rippling water, into which a gondola is emerging from the luminous shadow under the bridge. Next in the catalogue comes "The Vintage," by Mr. Charles Shannon, a work of which the meritorious qualities of restraint, elegance and coolness, and good composition suffer from the proximity. Mr. Richard Jack's "Whither"? is one of the topical pictures, but it is more, in its skilful combination of reality and idealism and its well considered colour scheme.

Mr. G. W. Lambert's "Hospital" in the first room also touches the topical and unites fantasy therewith in the introduction of a dream vision of floating female figures, contrasting beautiful forms with the grim realities of a surgical ward. The equal solidity of rendering of the dream figures with those of the real persons of patient, doctors and nurses gives poignancy and avoids any mawkishness of sentiment which less capable handling might have introduced. In this same room Mr. Wilfrid G. Von Glehn's "The Piazzetta, Venice: from a Gondola" is a charming and vivacious piece of colour, though the planes of the various parts of the scene are unhappily confused. Mr. D. Y. Cameron's "Bencleuch," a near neighbour on the walls, must not escape notice, with its long-stretched horizontal parallel lines emphasising the spaciousness and quiet dignity of a typical Highland landscape. Another piece of pleasant and piquantly restful scenery is seen in Mr. Leslie Thomson's "The Shore: Arisaig," where again the value of horizontal parallelism is enforced.

Of the sculpture, the water colours, the black and white, we have not space to speak in detail even though we leave unmentioned many other oil paintings of note, but our personal interest was attracted by the "Hall of Columns: Karnac," by Mr. R. Phené Spiers and Mr. W. Walcot's "The Palace of Justice: Brussels." Suffice it to say that the Exhibition is an enjoyable one by reason of its limitations in extent of covered wall and in size of frames, as well as for the character of the work exhibited.

NOTES ON BOOKS.

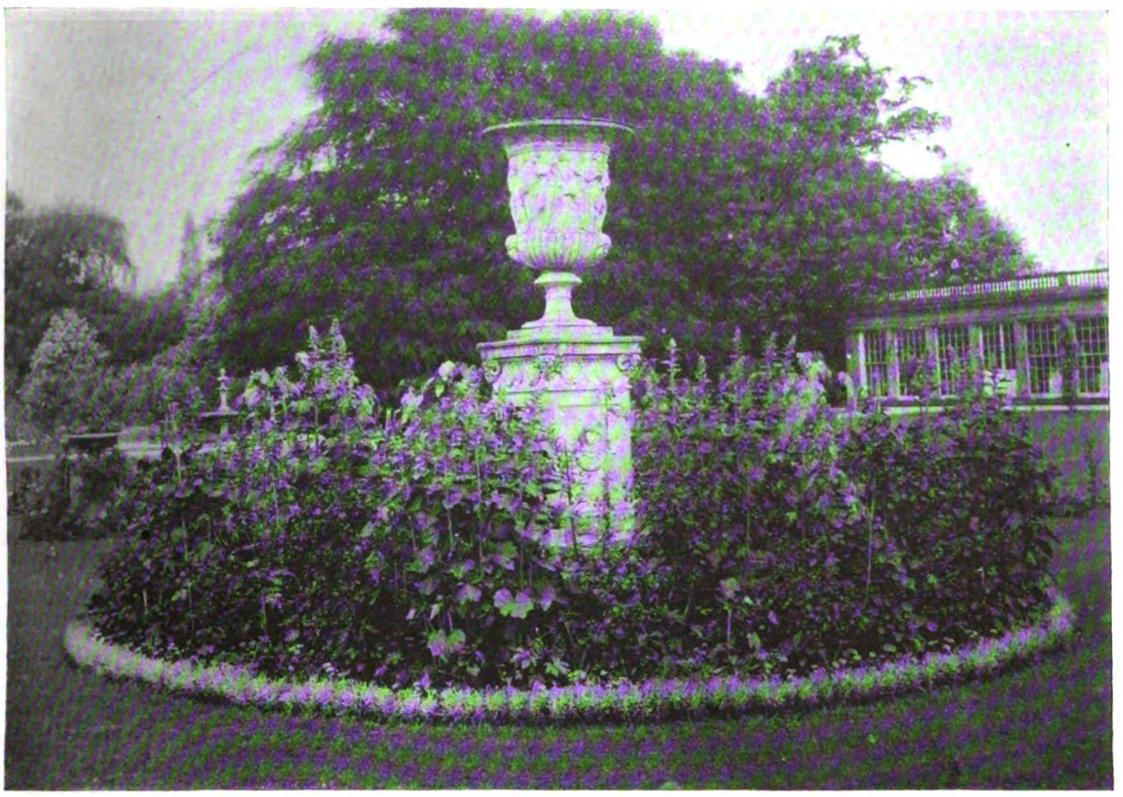
"An Introduction to Town Planning." A Handbook dealing with the Principles of the subject and a consideration of the Problems involved, Powers of Local Authorities, &c. By Julian Julian, B.E., Borough Surveyor, Cambridge. With Appendices on Garden Cities and Garden Suburbs, Schedule of Town Planning Act, &c. With diagrams and plans. (London: Charles Griffin & Co., Ltd. 5*s.* net.)

THIS Handbook is an introduction, and it is nothing more. That is to say, it barely touches the fringe of the many diverse elements concerned in town planning, although it deals—in fragmentary fashion—with ancient town planning in Rome, Athens, Colchester, and Winchester. Thus the first chapter, which is devoted to this subject, illustrates the general character of the book. It tells us something of ancient town planning, but leaves much unsaid. So also with chapters on Mediæval and Modern Town Planning and By-laws. In a small Handbook such as this, which professes to be an introduction to a great subject, there is too much irrelevant matter, and space is wasted on the relation of incidents which might have been more profitably utilised. The best feature of the book is a list of books which specially or incidentally deal with town planning, because—although it is, as described, "short," and is incomplete—it does indicate some sources of information for the prospective student of town planning. The title of the book would be more correct if it were styled "An introduction to the study of town planning," for which it might serve. It is certainly misnamed by its present title.

"Notes on the Valuation of Real Property," containing examples of freehold and leasehold properties. By H. G. Lamputt, Associate of the Auctioneers' and Estate Agents' Institute. (London: Crosby Lockwood & Son. 1*s.* 6*d.* net.)

OF the subjects which cannot be taught by books one would scarcely be far wrong in assigning the premier position to the valuation of real property, and this little book, intended for those taking the Intermediate examinations held by the Auctioneers' and Surveyors' Institutions, either belittles the character of those examinations or fails to substantiate the claim that it "contains a general knowledge of the principles and practice of the valuation of real property." This it certainly does not contain, and if it is correct that the "general knowledge" is "as required in these examinations" we are sorry for the examinations. All that the book does contain is an explanation of the calculation of the figures in valuations when the value has been determined. It is a pity that the author has not given the student some indication of the principles and practice by which a valuer arrives at the determinant factor or factors of a valuation. Some of the examples given are ludicrous in the falsity of the determinant factor assumed, as, for example, the site "of a freehold shop situated in the City occupying an unique position" is by the author stated to be "worth a ground rent of 6*d.* per foot super." The position must indeed be unique.

The London Building Acts, including the London Building Act, 1894; the Amendment Acts of 1898 and 1905; L.C.C. General Powers Act, 1908 and 1909; the Cinematograph Act, 1909; Town Planning Act, &c. A Text-book on the law relating to building in the Metropolis. For the use of architects, surveyors, builders, &c. Containing full text of the Acts, together with the current by-laws, standing orders, and regulations of the London County Council, the Corporation of the City of London, &c. By Professor Banister Fletcher, J.P., D.L., F.R.I.B.A., F.K.C., &c. Fifth edition. Revised, re-arranged, and enlarged, with further notes and cases, by Banister Flight Fletcher, F.R.I.B.A., F.S.I., architect, barrister-at-law of the Inner Temple, and Herbert Phillips Fletcher, F.R.I.B.A., F.S.I., architect, A.M.I.C.E., barrister-at-law of the Middle Temple. Illustrated with numerous plates. (London: B. T. Batsford, Ltd. 10*s.* 6*d.* net.)



Dilapidations and Fixtures. A text-book in tabulated form for the use of architects, surveyors, and others. By the same authors. Seventh edition. Revised and largely re-written. (London: B. T. Batsford, Ltd. 6*s.* 6*d.*)

TEXT-BOOKS that have run into fifth and seventh editions have thereby proved their value beyond dispute. All that need be said of the latest editions is that they are a manifold improvement on their forerunners.

"Stencils and Stencilling for All Purposes: Artistic and Decorative." By Arthur Louis Duthie. (London: The Trade Papers Publishing Company, Ltd.)

ALTHOUGH the preface to this book lays stress on the attention given by the author to details of design, it is rather

Digitized by Google

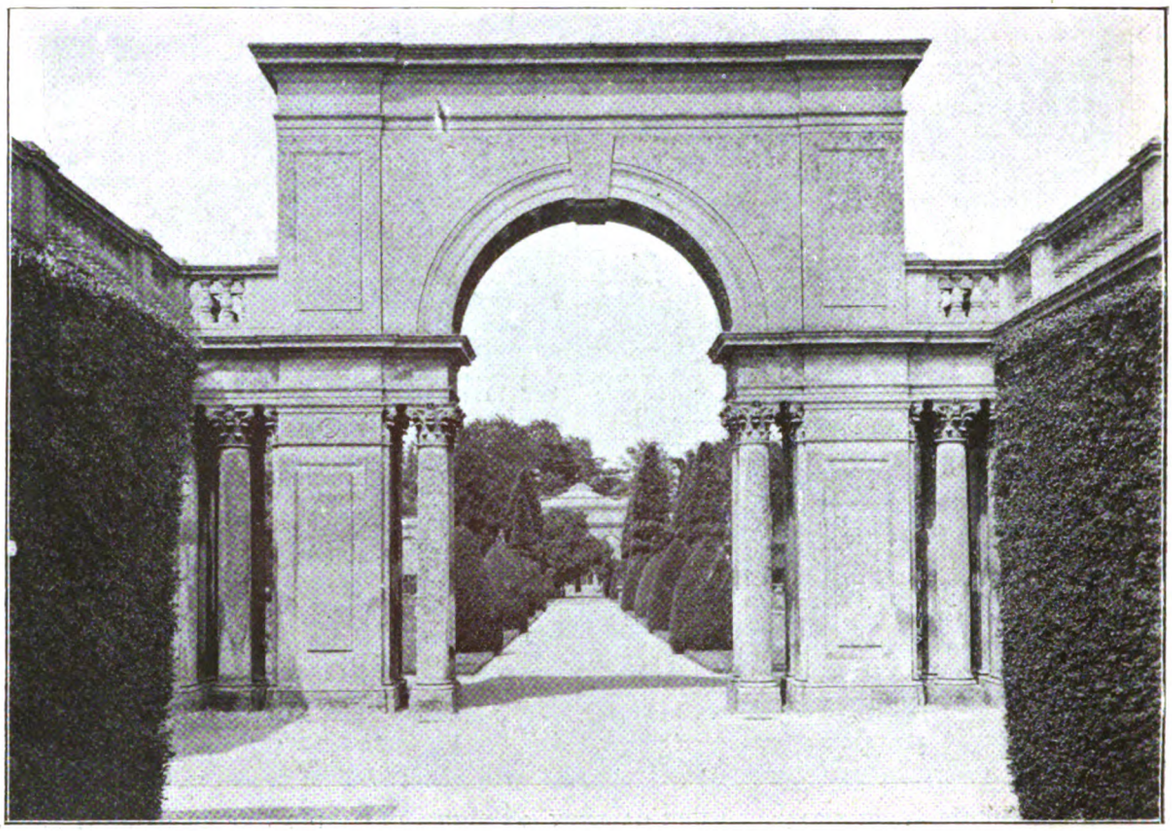
GARDEN ORNAMENTS.—VASE AND SCULPTURE GALLERY (ON RIGHT) IN GARDENS AT BROCKLESBY PARK.

for the admirable exposition of the technique of stencilling that we consider it worthy of high commendation. As regards the treatment of design, we acknowledge that the limitations of stencilling and the effect of those limitations on the design of stencils are well treated; but in order to design a satisfactory stencil one must learn first of all to design, and there is some fear in our mind that the numerous examples of stencils given in the book, some of which are excellent and some otherwise, may be regarded rather as patterns to be copied by decorators, for whom "the present volume has been written mainly." But for the artist or craftsman who has already learnt what is and what is not good in design the book will be very valuable as helping him to design with due regard to the capabilities, as well as the limitations, of stencilling, and still more valuable as an assistance to the operative part of stencilling. To get the best out of the craft there is required not only an artist to design the stencil, but an artist to apply it when cut. Stencilling is far from being a mere mechanical process. It is, on the contrary, capable of great individuality of expression when operated by an artist.

Estimating: being the Analysis of Builders' Prices. With full information of estimating, containing analyses, tables detailing prices, and useful memoranda. By Thomas D. L. Piper. With sixty-five illustrations. Part II. Pavior, mason, carpenter. (Portsmouth: Holbrook & Son, Ltd.)

As far as such books can go, Mr. Piper's volumes on estimating are of practical value to the young estimator as showing what matters must be taken into consideration in pricing any individual item in a bill of quantities; but in every case the estimator will, of course, find it necessary to acquaint himself with the actual prime cost both of material and labour in the particular business with which he is concerned. Not only can one business buy better than another in certain commodities, but usually it is at a disadvantage with the same competitor in respect of others. There is also frequently present the phenomenon that skilled workmen as well as labourers in one firm's employ give a better output in one trade than in another, and the profitable trade is not the same with every firm. Hence accurate estimating depends upon an accurate knowledge of the actual prime cost of every item of material and of labour in the particular circumstances of each individual firm. No book of prices, even carefully analysed as in Mr. Piper's writings, can be universally correct, and estimating from price-books must always be on the principle that "What you loses on the round-abouts you makes up on the swings."

THE ROYAL INSTITUTE OF ARCHITECTS OF IRELAND.



AN ordinary meeting of the Council of the above body was held at the Institute rooms, 31 South Frederick Street, Dublin, on Monday last, the 11th inst, at 11 A.M. Owing to the unavoidable absence of the President and Vice-President, Mr. C. A. Owen occupied the chair, and there were also present: Messrs. A. G. C. Millar, H. Allberry, W. A. Scott, F. Hayes, P. L. Dickinson, L. O'Callaghan, J. H. Webb, and F. G. Hicks (Hon. Secretary). The minutes of the previous meetings were read and signed, and a considerable amount of correspondence dealt with, including a letter from the City Treasurer asking that the Arts Committee of the Institute might inspect and advise on the suitability of the proposed frescoes in the City Hall. The following sub-committees were appointed: Professional Practice—W. Kaye-Parry, J. H. Webb, and F. Batchelor; Publication—F. Hayes, C. A. Owen, and Harry Allberry; Arts—G. P. Sheridan, L. O'Callaghan, and W. A. Scott; Examination—R. M. Butler, A. G. C. Millar, and A. E. Murray; Library—L. O'Callaghan, G. L. O'Connor, and P. L. Dickinson. The Arts Committee was instructed to deal with the formation of a record of ancient buildings of architectural interest throughout Ireland. Having transacted other business of the Council, the meeting concluded.

COMPETITION NEWS

SHEFFIELD.—The Estates Committee are asking from the Council authority to arrange forthwith an open competition for the planning or laying-out of roads on the High Storrs estate, with a view to development for building purposes.

MR. A. H. MOORE, A.R.I.B.A., is the architect to the rebuilding of No. 2 Royal Exchange Avenue and Nos. 18, 20, and 21 Finch Lane, E.C., for the British Dominions General Insurance Co., Ltd. The contract has been let to Messrs. Patman & Fotheringham, Ltd., of 100 and 102 Theobalds Road, W.C., and Islington, N.

GARDEN ORNAMENTS.—ARCHWAY IN THE GARDENS AT CASTLE ASHBY.

ILLUSTRATIONS.

UNIVERSITY OF LONDON, UNIVERSITY COLLEGE. NEW CHEMISTRY LABORATORY.

THE chemistry building has a frontage to Gower Place of 316 feet, and the drawing shows the principal entrance in the centre.

The whole of the front is in Portland stone. The building contains large laboratories for organic, inorganic, physical, technological, and pathological chemistry, a large lecture theatre to accommodate 230, two smaller theatres each to accommodate 110, museum, library, professors' laboratories and private rooms, also balance, preparation, and other necessary rooms and offices. A feature of the building is a series of separate smaller laboratories for special research work. The building is connected with the north wing of the main block of University College by a corridor across Little Gower Place, which leads direct to the eastern staircase, which will be the one mainly used by students. The principal staircase is opposite the main entrance, and serves all floors. There is also a private entrance and staircase to the research wing at the extreme western end of the building, and an outside escape staircase at the extreme eastern end serving the large second-floor laboratories and the principal lecture theatre.

The general contractors were Messrs. Dove Bros.; the iron railings and lamp standards outside, and staircase ballusters, &c., inside, were made by the Birmingham Guild; Messrs. Davidson & Co. are supplying the fans for the general ventilation (the ventilation from fume-cupboards being managed separately); and the extensive internal fittings are now being made by Mr. James Carmichael. The architect is Professor F. M. Simpson, F.R.I.B.A.

ASHMOLEAN MUSEUM AND UNIVERSITY GALLERIES, OXFORD.

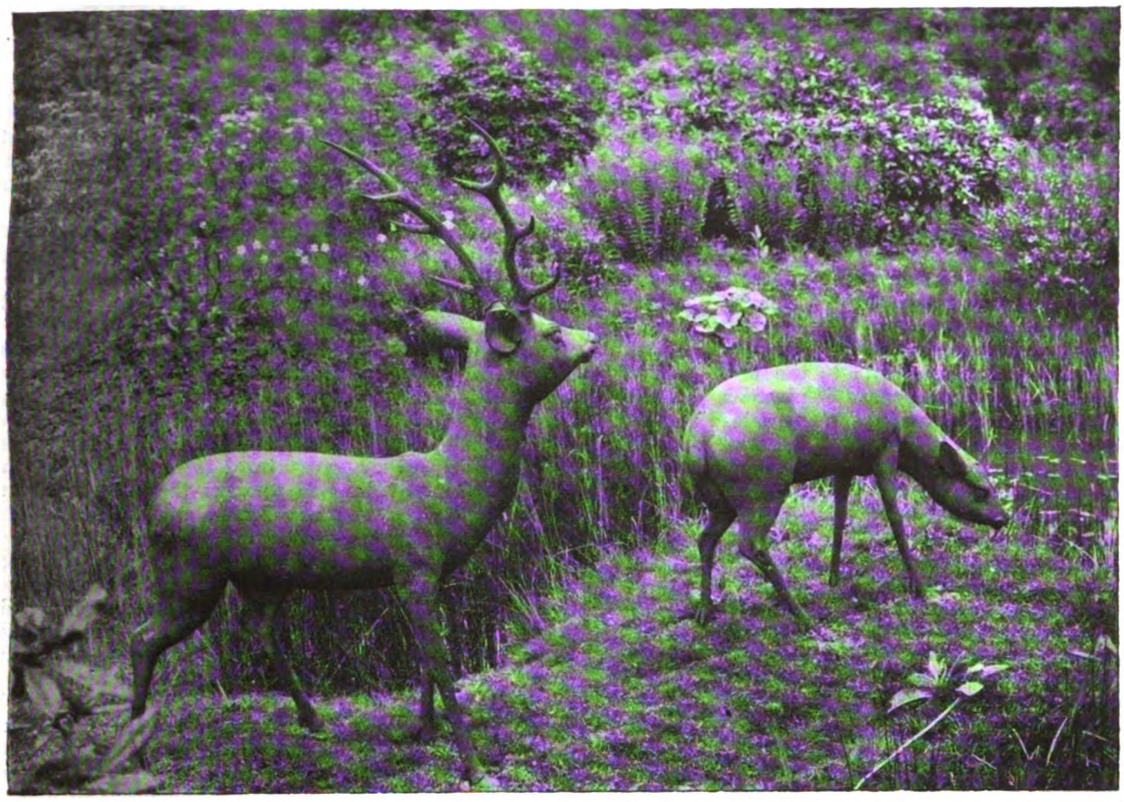
THE work of Charles Robert Cockerell should be of peculiar interest at the present day, when the use of modernised Greek detail is again becoming fashionable.

ELEMENTARY SCHOOL, LINDA STREET, BATTERSEA.

THE drawings we reproduce were submitted by Messrs. Nicol & Nicol in the open competition promoted last year by the London County Council.

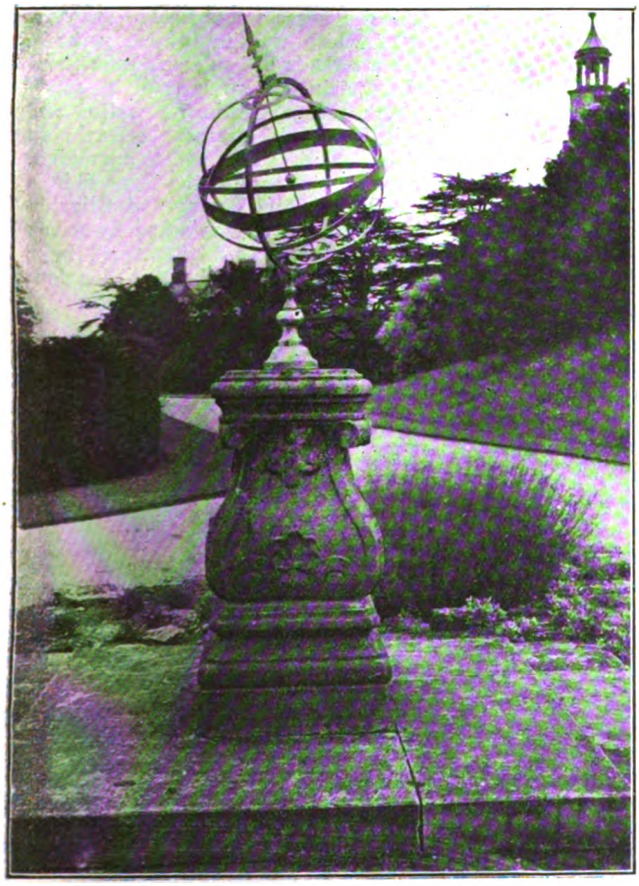
THE RADCLIFFE LIBRARY, OXFORD.

THE drawing of this well-known work of James Gibbs was made by Mr. Charles S. Carter during his tour as holder of "The Architect" Travelling Studentship in 1914.



ANTWERP.

ANTWERP'S modern prosperity—anterior to the war—has diminished its picturesqueness, but much still remains, though not to the same extent as when Samuel Prout made the drawings included in "Continental Sketches."



GARDEN ORNAMENTS.

THE ornamentation of a garden, apart from its horticultural adornment, requires much artistic taste on the part of the architect, the sculptor, and the worker in wood and metal. In recent years there has been a marked improvement in the design and execution of garden ornaments, but there is still scope for further effort, and, as this class of work is likely to become increasingly remunerative, it is worth while devoting considerable attention to it. People are beginning to take a keener interest in their gardens, and large sums of money are being spent on their adornment. It too frequently happens that where an architect is called in to prepare plans and superintend the erection of a private residence, someone else is subsequently employed to lay out the grounds and provide any ornaments that may be deemed necessary. This plan may work out all right, but in many instances it has proved to be a mistake. The architect is surely the person to decide upon the setting of the house he has erected, and so guard against incongruity in the ornaments employed to adorn the garden and grounds. The photographs which illustrate this note may be suggestive of what can be done in this direction. First, there is the entrance to the garden, and what can be more appropriate than a wrought-iron or bronze gate, with figures, for preference, upon the pillars? Then there are the intermediate gateways within the gardens, which are too frequently plain openings in the wall, without any attempt at architectural embellishment. How much better the Milton example is than one of the character indicated? The buildings, too, within the enclosure, such as conservatories and

GARDEN ORNAMENTS.—BRONZE DEER IN THE WATER GARDEN AT BELVOIR.

SUNDIAL AT WELBECK ABBEY.

SUNDIAL AT RAMSEY ABBEY.

other horticultural structures, are deserving of more attention from the architect, and these should harmonise with the style of architecture adopted for the adjacent house. The Palm House, at Castle Ashby, and the archway leading towards it, are good examples in this respect. There is happily a revival of interest in the old-fashioned sundial as a garden ornament, and there is much scope for elegance of design in the construction of the pedestal and its sur-

Digitized by Google

rounding base. It has been said that no garden is complete without its sundial, and there is a great deal of truth in the statement.

"Serene he stands amid the flowers,
And only counts life's sunny hours,
For him dark days do not exist,
The brazen-faced old optimist."

The centre of the rose garden is an ideal position for the sundial, and the example reproduced from the garden of Major Weigall, M.P., at Petwood, Woodhall Spa, is suggestive of what may be done in this direction. Sufficient use is not made of statues in the adornment of our gardens and pleasure grounds. Where they are judiciously chosen, and placed in appropriate positions, they are very effective. Lead figures of artistic design, similar to the illustration from the gardens at Welbeck, add to the beauty of any garden. This is one of a pair recently placed by the Duke of Portland at the foot of a flight of steps leading to the

LEAD FIGURE IN GARDENS AT WELBECK ABBEY.

terrace. White stone figures, too, show up well against sombre backgrounds, or at the entrance to the pergola, or at the intersection of paths. The subjects should be appropriate to the setting of simple, but artistic, design, and anything heavy or repulsive should be avoided. There is much room for improvement in the construction of pergolas. Too frequently these are raised upon wooden supports, which, sooner or later, decay and the whole structure is endangered. Stone supports are essential for stability, and wood should only be employed for the beams from pillar to pillar, as in the modern example in the new water garden recently made for the Duchess of Portland at Welbeck. It is essential, too, that the floor of the pergola should be of stone, preference being given to irregular blocks, not closely fitted, so that small plants may be inserted in the interstices. Considerable scope is given to the architect in the designing of arbours, loggias, &c. Here, again, the old-fashioned rustic summer-house should be eschewed, and stone structures of classical design erected in commanding positions.

SIR ASTON WEBB, R.A., is acting as hon. architect in connection with the alterations to be carried out to meet the requirements of the Board of Education at the St. Bartholomew the Great Schools.

SCARBOROUGH CASTLE.

By J. TAVENOR PERRY.

WHEN Harold Hardrada went a-raiding in the middle of the eleventh century with his friend Tosty, the recreant Earl of Northumberland, we read in his Saga that "he sailed southwards past Scotland till he came to England, to a place called Kliflond (Cleveland); there he went ashore and ravaged and subdued the land, meeting with no resistance. Thereupon he sailed to Skardaborg and fought against the townsmen; he went up on a high rock near the town, and set fire to a large pile which he made. They took long poles and lifted it up and threw it down into the town; soon one house after the other began to burn, and the whole town was destroyed. The Northmen slew many people, and took all the property they could get." Similar also was the recent raid by the degenerate descendants of a kindred race, making all allowance for the altered conditions of warfare, but with the essential difference that they were afraid to land, and ran away at the first hint of danger, whereas the earlier ruffian stood up for the fight and was beaten and killed at the battle of Stamford Bridge.

This incident contains the first reference to Scarborough in the annals of our country, though its name does not occur in Domesday. Its history is closely connected with that of the Castle, for whenever that was attacked the townsmen suffered, but its strength frequently saved them from more marauders. It is evident from the above-quoted Saga that there were no Saxon fortifications on the hill at Scarborough, and excavations have shown that neither Briton nor Roman considered it necessary to strengthen the defensive position provided by Nature; thus the first castle erected was only built in the reign of Stephen, when it was undertaken by William le Gros, Earl of Albemarle, and Lord of Holderness. Henry II. resumed possession of all the Crown lands alienated by Stephen, and he seized among others "famosum illud et nobile castrum quod dicitur Scartheburch"; though it had already fallen into a ruinous condition—possibly it had been knocked about in some siege—and he built "a great and noble keep" in its place, the castellan of which was, in future, to be a royal nominee. The first attacks it had to resist were those of the Earl of Pembroke desiring to get hold of Piers de Gavestone, who had taken refuge within its walls, and which afforded an impregnable defence against the Earl; but he starved out the garrison, and Sir Piers had to surrender. It got some knocking about from one of the Bruces in a raid into the northern counties; and during the Pilgrimage of Grace it was again unsuccessfully attacked by Aske; but in 1553, in Wyatt's rebellion, Lord Stratford, by a stratagem, got into it, though he only held it for four days.

FIG. 1.—OLD TOWN SEAL.

The most exciting period of its history was during the Great Rebellion, when it underwent more than one siege; and it was in the one in 1644-5 by Sir John Meldrum, the Parliamentary general, who had gained possession of the town itself by a *coup de main*, that the incident occurred which so much damaged the Priory Church, for he planted a battlery of guns within the chancel and fired on the castle *through the East window*. The garrison in self-defence trained their guns on the church and battery, and destroyed the chancel and much more of the sacred edifice; for even a worm, let alone a German, would turn in such a case.

Digitized by Google

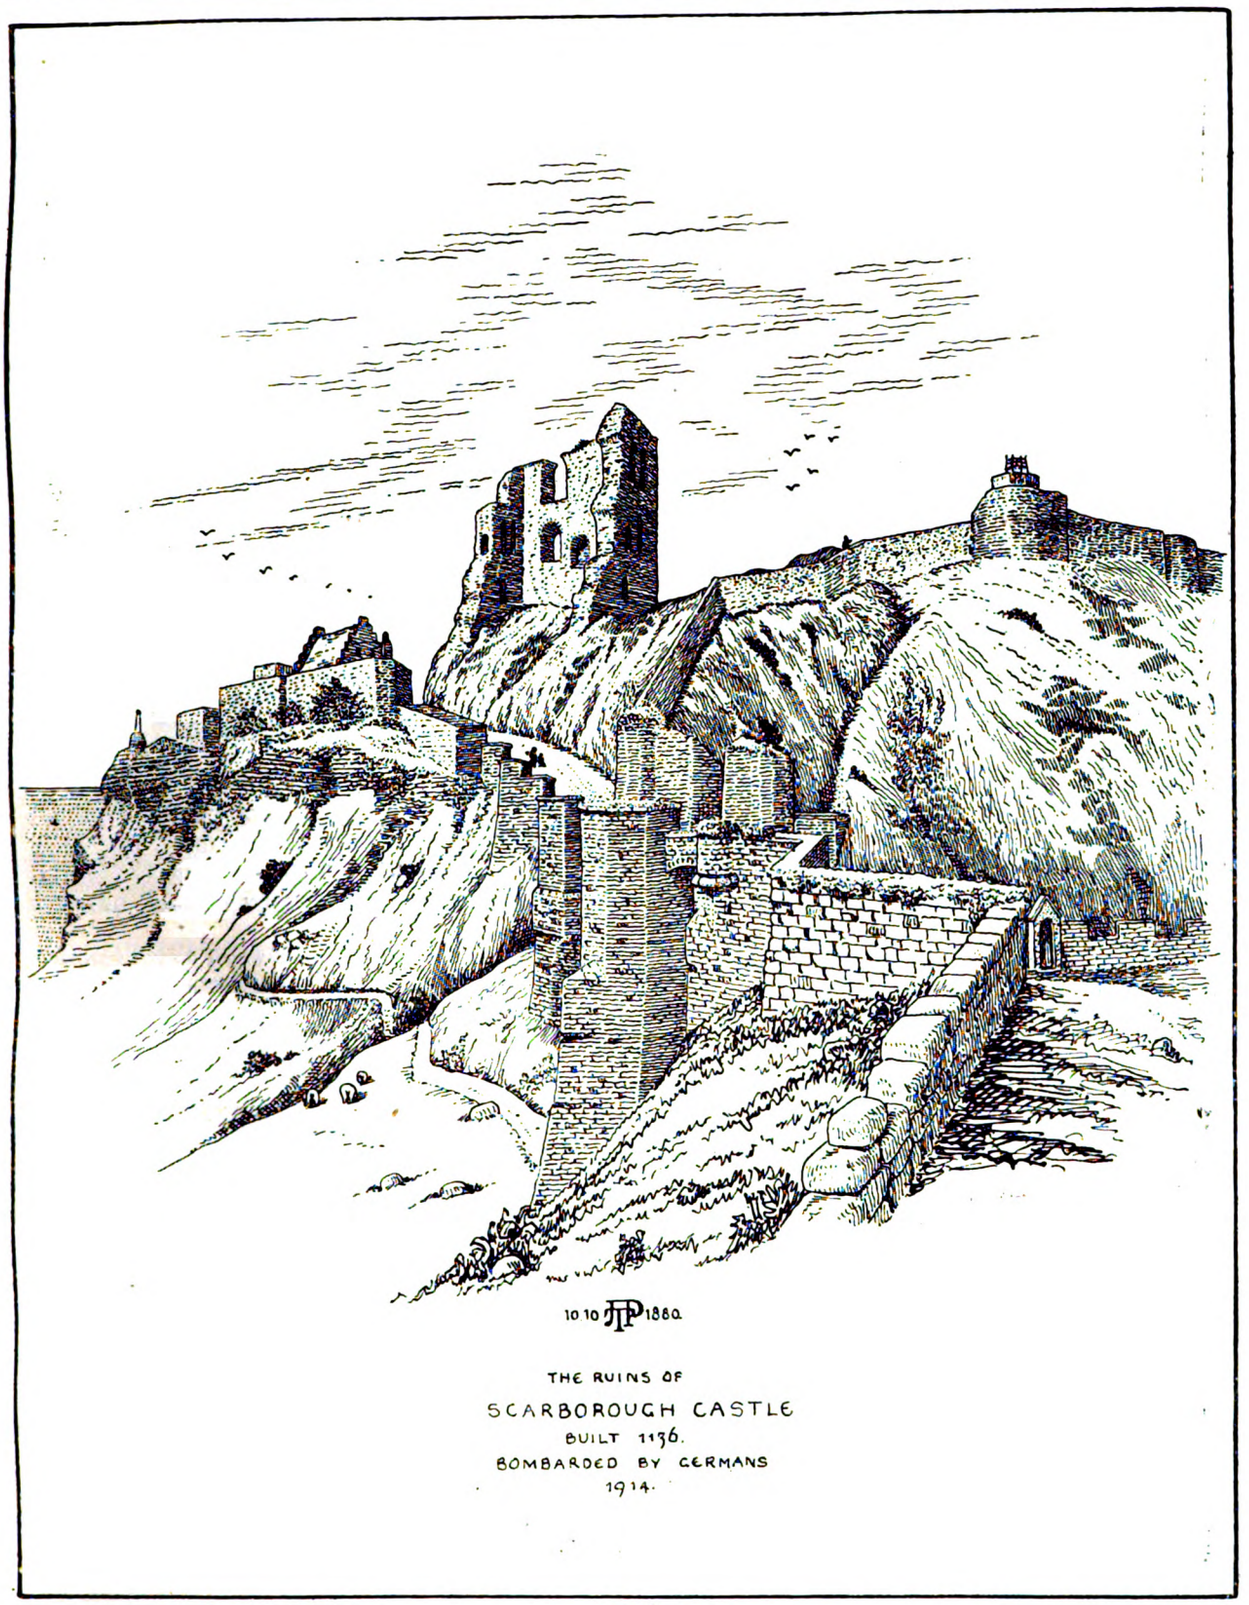

FIG. 2.

It was during the continuance of this internecine strife that the castle itself suffered many alterations, among others the towers and bastions of the curtain walls and barbican were cut down and filled with earth to make platforms for the mounting of swivel guns.

The town by the end of the thirteenth century had become so important that it sent two representatives to the Parliament of Acton Burnell (eleventh of Edward I., 1283); but it had received a charter of incorporation as early as the time of Henry II., no doubt at the building of the castle keep, and its ancient seal, of which we give a sketch (fig. 1), though varied in detail, shows no doubt, with its castellated structure and ship at sea, the design of the original one. Thanks to the defence of the castle the prosperity of the town was considerable, particularly as it was a "free mart," Flemings with linen cloths from Ypres and Ghent, and Osterlings from the Baltic, frequenting its markets; although it does not appear to have been, as was Hull, allied to the great Hanseatic League.

A reference to our plan (fig. 3) will show the general arrangements of the fortifications as now existing, and our sketch, taken from a point on the ridge to the west of the Barbican (fig. 2), gives the aspect of the ruins which the Germans affected to believe was a formidable defensive work and by their guns rendered only a little more ruinous.

The site consists of the land on the top of the lofty Scar which shows cliffs, almost inaccessible, on three sides towards the sea and is connected by a narrow ridge on the west side with the high ground running landwards. This ridge or causeway was cut through when the fortifications

Digitized by Google

were built, and the natural depressions on either side connected by a deep moat which was afterwards spanned by a drawbridge. In the centre of the plateau stands the ruin of Henry II.'s keep, which was when perfect 56 feet square—the Keep of Dover being 96 by 98 and of Rochester 70 feet square—the walls were throughout 11 feet thick and their greatest height about 90 feet. The material of which it is built is a deep red sandstone properly coursed in beds about 12 inches thick, with stones squared to about 2 feet or 2 feet

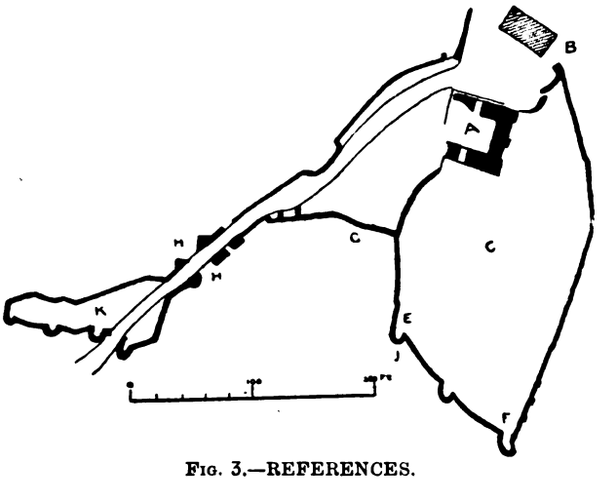

FIG. 3.—REFERENCES.

6 inches. The work is simple throughout and wanting in the enrichments which characterise Rochester, but has the same wall-passages, fireplaces, &c., though it is without any forebuilding or chapel connected with the keep such as is generally found in these towers.

The approach to the keep was defended by the barbican marked K on plan, of a very irregular shape built on the landward side of the artificial moat already referred to, and protecting the drawbridge, marked H on plan. From this point the road rose towards the keep guarded on each side by the percipitous slopes of the cliff as well as by curtain walls, the southern of which, looking over the town, is loopholed. At the end of this road and just beyond the keep was a gateway, now destroyed, which led into the inner court (see B and D on plan). Occupying the highest part of the plateau is the Castle Bailey, C on plan, protected all round by independent walls and ditches and with round towers at intervals on the landward side, on one of which—E on plan—was the beacon, the great iron cresset of it still remaining. There were numerous important buildings, such as the hall and chapel, standing in the inner court; but these have all disappeared and, save the shell of the great keep and the curtain walls and barbican, nothing remains of that noble fortification that was once called Scartheburch.

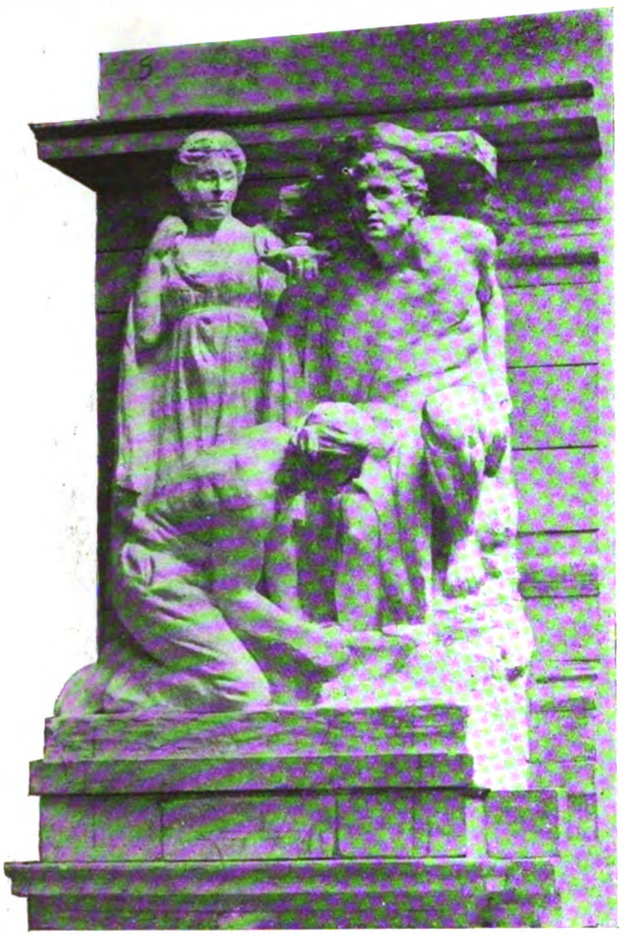
Some slight notice must be taken of the Priory Church which occupied a portion of the ridge on which the castle was built, as, though these two did not run well together in harness, they were intimately associated in each other's good or evil fortune.

The date of the foundation of the Parish Church is uncertain, and as the town is not mentioned in Domesday and no church is spoken of as having been destroyed in the raid of Harold Hardrada, it is probable that it was first built, like the neighbouring castle, only in the reign of Stephen. It was given, together with its chapels, one of which formed the Castle Chapel and stood in the inner court, in 1198 by Richard I. to the Abbey of Citeaux, and Cistercians forthwith established a priory at Scarborough for the monks sent over from Burgundy to look after their rectorial interests in the place; and later Henry III. granted the land on which to erect their conventual buildings. As the monks, however, sent all their revenues abroad Edward I. in 1285, Edward II. in 1337, and Edward III. in 1361 intercepted this flow of wealth to an alien enemy and applied the confiscated funds to their own needs. On the suppression of the "Alien Priories" by Statute 2 of Henry V., 1413, it was given to the Prior of Bridlington, a house of Austin Canons, but at the Dissolution the rectory was seized by Henry VIII. and the Priory and Convent suppressed and all the conventual buildings then, or gradually afterwards, destroyed.

No remains of the church of Stephen's time exist, but before the destruction of the chancel the whole formed a cruciform structure generally Early English of the best period, except Decorated additions and the chancel and north porch, which were Perpendicular. The nave has two north aisles, the outer one being fifteenth-century work, and one south aisle with four projecting and different chantry chapels covered with ribbed vaulting. There were small western

FIG. 4.—REMAINS OF THE PRIORY CHURCH OF ST. MARY

towers at the end of each aisle which do not now, however, appear above the roof, and these opened into the aisles with Early English arches and clustered piers. The west end of the nave, between the towers, has clustered vaulting shafts rising to the roof, and the front is lighted by three lancets and a wheel window above. But all this work, together with the rest of the church, underwent a fierce restoration in 1850. It may be mentioned that some late Decorated piers with grotesque capitals to be found in the interior are said to have been brought here from another church in the town. Of the destroyed chancel a small portion remains which shows in our sketch (fig. 4), and we can only say that when complete it consisted of three aisles and terminated with a square east end. The south transept, also showing in the drawing, is much restored Decorated work, while the central tower, for which there was no authority, is entirely an erection of the seventeenth century.



The prosperity of old Scarborough rested on the protection of its castle, and that of modern Scarborough on the patronage of its Spa: and with this for a foundation, and by aid of the charm of its position and the perfection of its hotels, it has risen to be the chief of our East Coast resorts. But in its peaceful avocations it has just been reminded of a saying almost forgotten but current in the town in its warlike days, "A blow first and a word after."

SCULPTURE FOR THE WELSH NATIONAL MUSEUM.

WE recorded some time ago the inception of a limited competition for the selection of sculptors to be entrusted with work at the National Museum of Wales. We now give illustrations of selected designs as to which the recommendations of the Building Committee, now approved by the Council, were:—To commission Mr. Gilbert Boyes (London) to carry out his design, "The Bronze Age," subject to the full-sized or half-sized model being to the assessors' approval, and that he be desired to submit a design at quarter-full-size for a companion group, "The Iron Age."

To commission Mr. Richard Garbe, London, to carry out his design, "The Stone Age," upon the same conditions, and that he be desired to submit a design for a companion group, "The Coal Age."

Digitized by Google

THE COAL AGE, BY T. S. CLAPPERTON.

THE STONE AGE, BY RICHARD GARBE.

To commission Mr. T. S. Clapperton, London, to carry out his design, "The Coal Age," as the group illustrating "Mining," for the west front upon the same conditions, and that he be desired to submit a design illustrative of "Shipping" for a companion group.

Also to request Mr. D. Arthur Thomas, Cardiff, to submit a model for the dragons, and Mr. Bertram Pegram to submit a model for the lions required for the pedestals surrounding the base of the dome.

The photographs are by the *South Wales Daily News*.

THE SOCIETY OF ARCHITECTS.

WE give an abstract from the Report of the Council for the year ended October 31, 1914, of matters that are of wider interest than the domestic concerns of the Society:—

Statutory Registration of Architects.—In November, 1913, your Council completed its revision of the Society's draft Registration Bill, and the document was settled in conference with Sir Alfred Cripps, K.C., M.P. (now Lord Parmoor). The Bill was then published in the Society's *Journal*, and was issued to the professional Press and made public generally, with a view of inviting observations and criticisms thereon. As a result of this publicity a number of useful opinions and suggestions were received and noted for future consideration.

A copy of the Bill was also sent to the Councils of interested professional bodies. No objection was raised by them on the question of principle, but the Auctioneers' Institute sought to have that body scheduled in the Bill, and the Institution of Municipal Engineers thought their members were not sufficiently protected. Your Council did not see its way to meet the wishes of the Auctioneers' Institute, and consider that the members of the Institution of Municipal Engineers were already sufficiently covered, though your Council was prepared to discuss the matter with the Institution.

The Society's proposals attracted a good deal of attention among other professions, notably the dentists, whose organ, *The Dental Surgeon*, pointed out that if certain sections of the Dentists Act (relating chiefly to restriction of the title of dentist to qualified persons, and recovery in a court of law of charges for professional services) had been drawn on the lines of similar clauses in the Society's Bill, the present position of affairs in the dentists' profession would never have come about.

Some useful criticism was also received from *The South African Architect*, based on experience of the working of the Transvaal Architects Act, which it will be remembered the Society was to a considerable extent instrumental in securing. The Journal in question holds the view (on which some difference of opinion exists in the profession in South Africa) that a Registration Bill should confine itself entirely to registration matters, and should not include any provision for educating the architect before registering him, the point being that architects should not be taxed to assist in further filling an already overcrowded profession. Your Council, on the other hand, considers that one of the advantages of Statutory Registration would be that an Act such as that proposed by the Society would at once define a standard of architectural education, and that everyone desirous of taking up the profession in the future would know what was required of him before spending time and money in endeavouring to qualify.

At a meeting held on January 5, 1914, the general body of the R.I.B.A. decided not to proceed with a Registration Bill, at any rate for the present, but to apply for an extension of their Charter to enable them to confer the title of "Chartered Architect" upon all persons passing a stated examination. It was understood that this decision was come to owing to the R.I.B.A. Council having been notified by their legal advisers that the Institute could not promote a Parliamentary Bill on this subject, because of certain constitutional disabilities under which the non-corporate class of Licentiates were suffering.

It then became, from the Society's point of view, a question of voluntary versus statutory registration, the essential difference between the registration proposals of the R.I.B.A. and of the Society being that the former favoured a policy of voluntary registration within the Institute, and the latter a policy of statutory registration for every member of the profession, whether belonging to any architectural body or not.

The feeling of some of the members of the Institute on

Digitized by Google

the Charter question may be gathered from the fact that Committees of Associates and Licentiates were formed with a view of watching their own interests.

Your Council had in the meantime taken steps to submit a counter petition to the Privy Council in the event of the Charter proposals being proceeded with.

Last March the then President of the R.I.B.A. circularised the Allied Societies to the effect that the Council of the Institute had decided to oppose the Society's Registration Bill on the ground that it was detrimental to the interests of the Institute, and conflicted fundamentally with their new policy of registration by charter. Your Council thereupon issued a counter statement through the professional journals and direct to the provincial societies, showing at a glance the difference between the proposals of the two bodies.

About this time the Auctioneers' and Estate Agents' Institute presented a Bill to Parliament, the object of which was to establish a register of persons practising as auctioneers or estate agents dealing with real estate and to prescribe the qualifications for admission to the register.

The effect of the measure, if it became law, would be that an architect who is not a member of the Society of Architects or of one of the other scheduled bodies would not be allowed to make a valuation of real property for a consideration unless he was registered under the Act. As there are a number of architects who do not belong to the Society or any other architectural body, and most of them have to make valuations of property from time to time for various purposes, they are considerably affected by the proposed Bill. In order to continue to make these valuations they would have to register under the Act as auctioneers and estate agents, and pay an additional tax for registration fee and annual licence. The Society of Architects is one of the professional bodies scheduled in the Bill as being exempt from the operation of the Act. Here is one instance of the advantage of membership in a recognised professional body which is able to look after the interests of its members.

The outbreak of the war has put a stop for the present to the promotion of the Institute Charter in the Privy Council, and of the Society's Bill in Parliament. In regard to the latter, although the parliamentary procedure has not been gone on with, every opportunity is being taken by the Society to further prepare the ground for future propaganda should it be necessary to resume the promotion of the Bill in Parliament after the war. The hope has been expressed, and it is one in which your Council concurs, that as the war has had the good effect of drawing together the members of the architectural profession without reference to architectural politics, that this happy state may continue, and that when peace is declared it may relate not to one kind of war only, and that some method may by then have been arrived at of settling any little differences in regard to the means to be adopted in attaining the end which both the Society and the Institute have in view.

The New Zealand Institute of Architects was successful last July in obtaining a Registration Act, having accomplished in one year what the profession at home has been seeking for thirty years. It is, however, only fair to point out that the New Zealand Bill was practically a Government measure, and, although the promoters had to overcome a certain amount of opposition from interested parties, they did not have to face dissension from a section of the profession, nor were they hampered by questions of architectural politics or parliamentary procedure. They are none the less entitled to hearty congratulations on their success.

Progress has also been made in some parts of Canada which have followed the lead set by Alberta and other provinces of that dominion. In Canada all the provincial architectural bodies are federated with the Royal Architectural Institute of Canadian Architects, which greatly facilitates the organisation, administration, and control of professional matters.

The Royal Victorian Institute of Architects, Melbourne, is proceeding with a Registration Bill, and a similar measure is to be introduced in New South Wales, and also in Tasmania.

Professional Practice.—One of the duties devolving upon your Council, through its Practice Committee, is to consider and, where possible, advise on questions relating to professional practice placed before it by members. Your Council does not deal with points of law, in regard to which members are referred to their legal advisers, but the Council has been able in many cases to very materially assist the member concerned by giving him the benefit of their combined experience on the point raised.

THE BRONZE AGE, BY ALBERT BAYES.

None of the cases which have been before the Council have been of sufficient general importance in principle to be sent immediately to the Board of Professional Defence, but in several cases the knowledge that the matter in dispute had been referred to the Council of the Society was sufficient to induce the parties to come to terms.

Professional Etiquette.—Another and less pleasant duty of your Council is to investigate any allegations brought against members for a breach of professional etiquette or of the Society's regulations. In every case where such an allegation has been made, your Council has held a most careful inquiry into the facts, and when the charge has been proved to its satisfaction and the member concerned has not been able to give a satisfactory explanation, his resignation has been demanded and received.

Your Council has taken up every case of unsatisfactory architectural competitions brought to its notice, and where it has failed to secure amendments the competition has been barred and the members warned not to take part therein. On three occasions during the year the warning was disregarded and the architects concerned are no longer members of the Society

The Society has acted in conjunction with the R.I.B.A. in this matter, and as the promoters of competitions are realising that responsible architects, particularly those who are members of architectural bodies, will not take part where the conditions are unsatisfactory, the profession itself is beginning to benefit by the increased recognition of its status by public bodies and others.

In some cases members have entered for competitions and prepared their drawings without consulting the Society first, and have afterwards found themselves in a difficult position when the competition has been barred. Your Council will be glad if members will send particulars of all competitions to the Society, whether they propose to enter or not

It is the desire of your Council that the Society should be the means of practically assisting its members in any difficulties in which they may find themselves in the course of their professional practice, and that it may be able to watch and protect their interests and through them the wider interests of the profession generally.

Digitized by Google

Cost of Building.—Your Council referred to a Committee the question of making an inquiry into the reasons for the excessive cost of building operations in the United Kingdom as compared with that in other countries, with a view of suggesting a remedy if possible. The subject is a very large one and the Committee had hardly got under way before the summer recess. Subsequently it was thought desirable, owing to the outbreak of war, that the inquiries should be suspended for the present.

Standard Documents.—Following an announcement in the last annual report, your Council is now able to say that a model form of conditions of contract has been drafted for the Society by Mr. W. Valentine Ball, Barrister-at-Law, based on suggestions made after long and careful inquiry into the matter by your Council. This matter is to be the subject of discussion at the December meeting, and it is anticipated that by the time this report is presented the form of the document will be practically settled. Your Council has also drafted, under legal guidance, a number of forms for party wall and other notices under the London Building Act. It is hoped that these documents, more particularly the form of building contract, may be found of practical service to the members.

Standardisation.—Some three months ago, in response to an invitation from the Engineering Standards Committee, your Council appointed Mr. B. R. Tucker to represent them on the Sectional Committee on Vitrified Ware Pipes, which was entrusted with the drafting of the British Standard Specification. This Committee has since completed its work, and its report has been approved and issued by the Main Committee. Your Council recommends the adoption of the specification.

Tenders in War Time.—The Institute of Builders approached your Council regarding a proviso which the Institute had authorised its members to endorse on all future tenders for building undertakings, with a view to providing for (*a*) the adjustment of any account for extras due to an increase in the cost of labour or materials owing to the war, and (*b*) a reasonable extension of time for any delay in obtaining labour or material owing to the same cause.

The question was also raised as to the liability or otherwise attaching to contracts for any damage caused by the King's enemies to works in progress. The suggestion was that a provisional sum should be reserved to cover the cost of insurance.

Your Council saw no objection to the principle of insurance against war risks, but it raised some objections to the form of the proviso and proposed a revised clause which the Institute of Builders has circulated to its members.

Your Council has received a number of inquiries from members relating to the difficulty of obtaining building materials owing to the war, and is in negotiation with the Local Government Board and other bodies which are conducting inquiries into the matter.

Northern Junction Railway Bill.—At the request of the Garden Cities and Town Planning Association, your Council appointed a representative to consider a proposition that the Society should join in a manifesto for opposing the Northern Junction Railway Bill. Mr. Percy Tubbs represented the Society, and as a result of his report it was decided to take no action in the matter.

Attendances on Sub-Contractors.—Your Council was approached by the Surveyors' Institution, who drew attention to the objection against accurate estimating imposed by the practice of leaving, in bills of quantities, the cutting away and attendance on sub-contractors to be priced in a lump sum by the principal contractor. As the ability of the Surveyors' Institution to deal with the subject of complaint depended largely upon the information placed at its disposal by architects, the co-operation of the Society of Architects was invited.

The matter was fully considered by your Council, which found itself in sympathy with the proposals of the Surveyors' Institution in principle, but suggested modifications in the method of carrying them into effect. The matter was still under negotiation at the end of the session.

Public Appointments.—Your Council has been able successfully to maintain the principle that candidature for important public architectural appointments should not be restricted to members of any one architectural body, but should be open to any bona-fide member of the profession. The case in point was that of the position of Superintending Architect for Nigeria, when the matter was taken up with the Crown Agents for the Colonies.

Your Council has also taken up with public bodies the question of the employment of practising architects rather than officials in connection with architectural works of a public character, and has approached a government department relative to officials undertaking outside architectural work in their spare time to the detriment of private practitioners.

First London Atelier of Architecture.—Early in the session the Beaux Arts Committee voluntarily released the Society from its financial guarantee, with due acknowledgment of the obligations to the Society which the Committee was under, in enabling it to carry on its work and become firmly established. The Committee asked that the privileges of using the Society's premises for its meetings and the clerical staff for its work might be renewed. Your Council gladly renewed these facilities, and in addition made a second donation of £100 from the Society's funds in furtherance of the Committee's work.

The members of the Society on the Beaux Arts Committee include Messrs. Percy B. Tubbs, E. C. P. Monson, R. Goulburn Lovell, A. Alban H. Scott, Thomas Wallis, L. Sylvester Sullivan, and the Secretary. The Atelier has now become firmly established and is recognised, even by those who at one time opposed the scheme, to be carrying on the traditions of the Beaux Arts method of architectural training on the right lines. Your Council is satisfied that its action in bringing into existence the Beaux Arts Committee and materially assisting in this work is one of the best things the Society has done, and is justified by results. There is little to show for it from a material point of view, but the influence which the Atelier is having on the future of architecture in Britain is already being felt and will undoubtedly be to the permanent good of the profession and the community.

The growth and development of the Atelier has been such that it was decided by the Beaux Arts Committee to establish a second Atelier in London, and premises had been secured when the outbreak of war put a stop for the present to any further progress in this direction. The Sous-Patron, Monsieur Chauers, was recalled to France for military duty, and all eligible members of the Atelier offered themselves for enlistment in the forces of the Crown, and those who were fit were accepted.

The Atelier is in the meantime carrying on its work successfully from the educational point of view, but under some material difficulties, and it may not be out of place to mention that architects who are interested in the movement can become members of the Atelier on payment of a subscription of £1 1*s.*, and so greatly assist the Committee in tiding over a difficult period. Many architects have taken this method of showing their approval of the principle upon which the Atelier is conducted.

Clerks of the Works.—At the request of the Incorporated Clerks of Works Association of Great Britain a Committee of your Council received a deputation from that body with a view to ventilating some questions affecting the interests of clerks of the works, more particularly in regard to the rates of wages offered to them by public bodies. It was thought that by enlisting the sympathy of architects, who were able to appreciate the points raised, something might be done in getting public bodies to see the advantage of offering such a wage as would secure the best available services.

The principle involved applies not only to clerks of the works, but to architects and members of other professions, and your Council was able to assure the deputation that they were in accord with them on this point. Another question raised by the deputation was as to who was liable in the event of injury or fatality to the clerk of the works in the discharge of his duty. Your Council, on subsequently going further into the matter, was advised that an injured person can claim for injury under Common Law, the Employers' Liability Act, or the Workmen's Compensation Act, and that therefore building owners should insure against this risk. The contract of service should be between the building owner and the clerk of the works, and the architect should, in his own interests, make sure that he does not incur any liability in the event of the building owner becoming insolvent, or from any other cause.

Architects and the War.—Within a few days of the outbreak of war, a meeting of architects, open to the whole of the profesion, was held at Conduit Street to consider the best way in which architects might offer their services to the nation during the crisis. Members of the Society were specially invited to attend a meeting, and a number of them did so.

Several resolutions were passed, and a committee was appointed to carry them into effect, the Society being repre-

Digitized by Google

sented by the President, the Vice-Presidents, and the Hon. Secretary.

Two sub-committees were subsequently formed, one for dealing with benevolence and the other with administration. Your Council held a meeting immediately afterwards, and unanimously decided to support the movement by placing at the disposal of the Architects' War Committee the Society's premises and clerical staff for the use of any of the sub-committees. Further, it voted a grant of one hundred guineas as a contribution to a fund to be formed for providing paid work for architects whose means of livelihood were stopped by the war. It also suggested the formation of a Professional Employment Sub-Committee for the administration of the fund, and outlined a scheme to enable architects in distress owing to the war to earn a living wage by doing work of a kind which would be a benefit to the community, rather than have to depend upon benevolent aid. Your Council also undertook to appeal to members of the Society for financial assistance. These offers, donations, and proposals were accepted and adopted by the Architects' War Committee, and the first meeting of the Benevolent Sub-Committee was held at the Society's premises on September 23, and has been continued every week since. The Society is represented not only on the War Committee, but on all the sub-committees. The Benevolent Sub-Committee has developed into the Professional Employment Committee. Mr. Percy B. Tubbs, F.R.I.B.A., M.S.A., is the Vice-Chairman of this latter committee, and Mr. C. McArthur Butler is the Acting Hon. Secretary. The Society is also represented by other members on this committee, and on the Executive and General Purposes Committee, the Selection Committee, and the Main Committee (Architects' War Committee).

The Professional Employment Committee is developing a scheme of civic surveys under the guidance of Mr. Lanchester, by which means it is hoped to offer employment not only to architects and surveyors, but to members of many other allied professions. In the mean time applications have been coming in from all parts of the country from architects affected by the war who desire employment, and the committee have been able to employ a number of them on useful work. One only need be mentioned as typical—that of replacing the collection of drawings and statistics on town planning, &c., belonging to Professor Geddes. These were lost in transit to Madras (where Professor Geddes is lecturing), owing to the ship in which they were carried being sunk by the *Emden*. The fund placed at the disposal of the committee by the Society, augmented by members and others, has so far enabled the committee to deal with some of the more pressing applications, but it is obvious that a much larger sum will be required if anything on an adequate scale is to be attempted. Your Council commends the matter to the generous consideration of members who have not yet subscribed. They will have the satisfaction of knowing that their money will be spent in productive work, the execution of which will enable distressed members of the profession to tide over a bad period. The Professional Employment Committee does not give benevolent aid, but refers any case requiring assistance of this kind to the Architects' Benevolent Society.

The state of war has naturally raised many questions of importance to the architectural profession in connection with contracts which are of too complicated a nature to be more than briefly referred to in this report. Your Council is dealing at every meeting with one or other of the points raised, such as prices, war risks, &c., and generally is doing everything in its power to assist members at the present crisis.

The Society was also invited to appoint a representative on the Professional Classes War Relief Council. Mr. Percy B. Tubbs was nominated, and is taking a very active part in the work of that body.

As far as can be ascertained, every member of the Society who is eligible and in a position to do so has offered himself for enlistment in his Majesty's Forces, and those who are fit have been accepted. The only member of the Society's clerical staff who was eligible enlisted. His place is being kept open, and the Society is paying him the difference between the Army pay and his salary.

At least one member is a prisoner of war, another has been mentioned in despatches, and it is certain that all who are on active service are taking their full share of the burden. Recognising this, your Council has in every case where such request has been made to it, relieved the member on active service from the payment of his subscription during the war.

Members who from force of circumstances are compelled to remain at home are doing other useful service by serving as special constables and as members of Volunteer Training Corps, or giving up a great deal of time to recruiting or to relief work of many kinds.

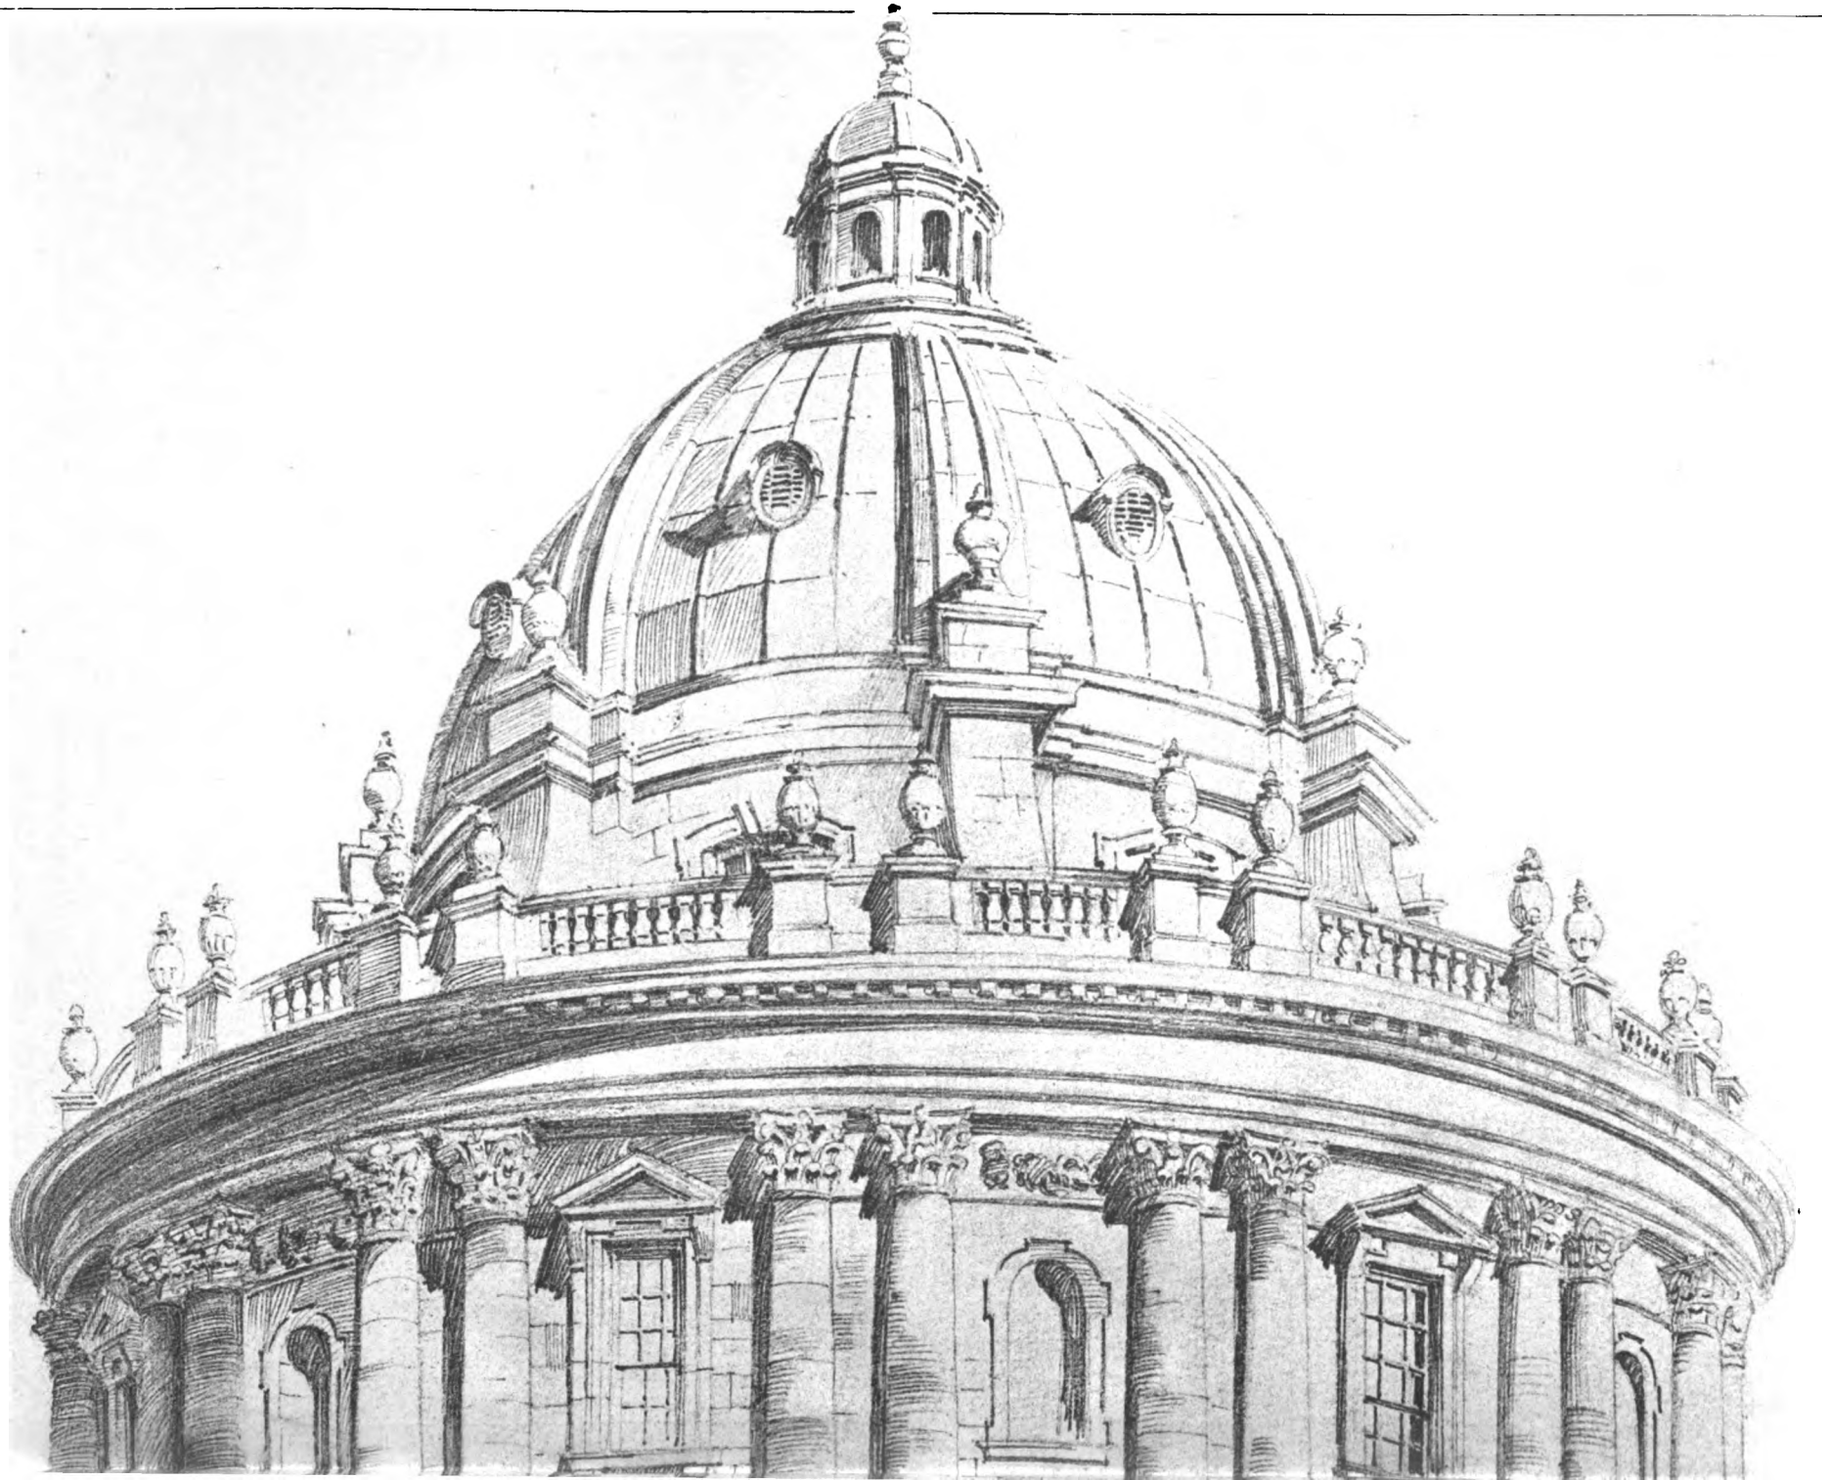
SOUTHAMPTON.*

By THEOPHILUS PITT, F.C.S.

AT first sight it would be supposed that the name of this striking town was of the simplest character, containing the *ham* and *ton* so frequent in our place names, with the addition of *south* as a prefix to distinguish it from Northampton. But the earliest form of the name was Hantune, containing, according to Mr. T. W. Shore (who in his time knew all there was to be known about the district), the Celtic word *an*, water. Mr. Shore does not tell us where this form of the name is to be found, but the form Hamtun occurs in a charter of Ethelwulf of A.D. 840, where it is described as a royal town of ancient demesne.

So important was the town of Southampton that it gave its name to the county at an early date. Hamtunscire is mentioned towards the end of the ninth century, and Suthamtune first occurs about 962.

The conquest of Celtic Britain by the Saxon races, though piecemeal, was complete in this part of the country.



TUDOR HOUSE.

The adjoining district of Anderida, now Sussex, was raided by Ælla and Cissa, who "slew all that were therein, nor was there afterwards one Briton left." Ælla and his three sons, Cissa, Wlencing, and Cymen, left their names in Ellanore, Chichester, Lancing, and Kynor, but we know not who led the Saxon invasion of the Southampton district. It would be expected that a place on the coast having such an important situation would rapidly grow, and even in the ninth century it was more than once referred to as the celebrated place called Heamtun. It was, moreover, the water way of approach to Winchester, most famous of cities and even the seat of Government for a period. Moreover, though so much farther from the Continent than Dover, there was in the past a very prominent French influence upon the town, as you will have had strongly impressed upon you in the walk round. The Danes made several

raids, as was their wont, and the inhabitants seem ultimately to have assisted them, for at Southampton Canute was chosen King. This forceful character has left his mark upon the south coast. The famous story of our school books is referred to Southampton, the western shore enshrines his name, he was supposed to have had a residence at Bosham, east of Portsmouth, and his daughter is traditionally buried there.

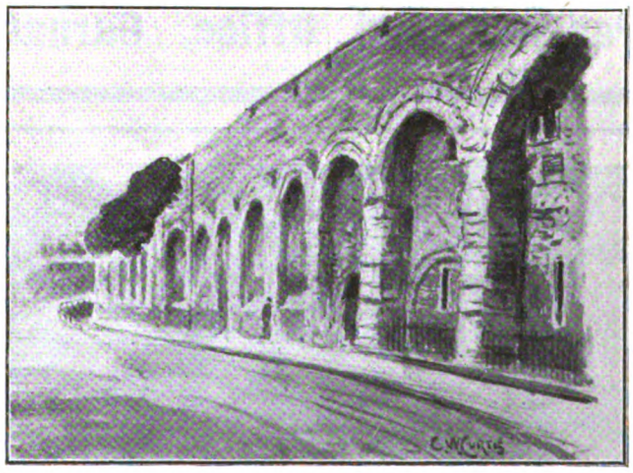
It is supposed that the site of Saxon Southampton was the district of St. Mary's, and not within the walls of the mediæval town. Excavations in various parts of St. Mary's parish revealed coins ranging in date from the eighth to the eleventh century, and no coins of parallel date have been found in the area of the mediæval town with perhaps

SOUTH-EAST TOWER AND GATE.

one exception. The Danes made repeated attacks from 837 to 1009, and peace was only secured by Canute's kingship.

Edward Confessor landed at Southampton on returning from France to claim the throne on Canute's death in 1035, but returned to Normandy until seven years later, when his claim was acknowledged. The period of the Norman Conquest gave a great stimulus to building: the town walls were commenced and the castle built. Of the castle nothing remains but the site, but parts of Norman architecture are to be seen in the interior arches of the Bargate, in the crossing of St. Michael's Church, in some underground work, and in the Norman domestic building known traditionally, but without definite reason, as "King John's Palace." There is no evidence that this building was ever a palace, or that King John had any special connection with it, and the name appears to have been given by John Duthy in 1839, as a mere conjecture. Apart from this, the building has a special interest of its own as a very early example of domestic Norman architecture. Of such we have a few specimens in the country—the Jews' House at Lincoln, with its typical round-headed arch facing the High Street; a house at Minster in Thanet; Christchurch in Hampshire; and Boothby Pagnell in Lincolnshire. These belong to the latter half of the twelfth century, while the Southampton building belongs to the earlier half. It is probably, therefore, actually the earliest Norman dwelling house in the country. It is a plain, square, stone building of about 50 feet on one side and 30 feet on the other, including the wall. One enters a doorway in Blue Anchor Lane having a round-headed doorway with plain chamfer to the arch and jambs.

Mr. R. M. Lucas, F.R.I.B.A., thus describes the building: "The lower room, into which one descends by five steps from Blue Anchor Lane, is about 24 feet by 18 feet, the long sides running north and south. In the northern wall is the doorway, and in the western are chamfered jambs indicating two wide openings, which were filled in (probably during the fourteenth century) with masonry, in which two oillets are formed. The room is lofty, and the original timbers (two oak beams roughly chamfered, about 14 inches square, on which rest smaller joists of various shapes and dimensions) remain, carrying the floor above it. The walls are rather over 2 feet thick. The upper room is open to the roof, of which the construction shows a desire to obtain symmetry with somewhat inadequate means. Two windows in the west wall and one in the north light this room. They are of the same size, but not of precisely similar construction. Every one of the three windows is divided externally by a baluster shaft, with base and foliated capital, into a pair of narrow, round-headed openings, while on the inside of the wall the whole opening is spanned by one arch about 3½ feet wide."



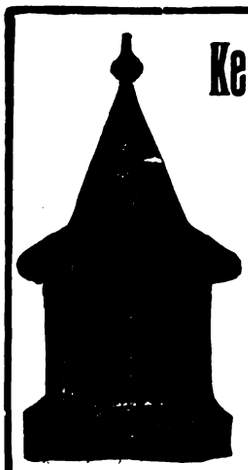
In 1124, Henry I. being King and Henry de Blois Bishop of the diocese, the Priory of St. Denis, with nine Augustinian black canons, was founded. To this priory Henry II. gave his four chapels, St. Michael, St. Cross (Holy Rood), St. Lawrence, and All Saints'. Of the Priory of St. Denis only a solitary fragment of grey wall remains. Here the remaining great conventual houses of Hampshire may be mentioned—Beaulieu, Netley, Romsey, Christchurch, Quarr, and Titchfield. The greater part of the churches of these confraternities exist, some entirely and used for services, others dismantled and roofless. Netley, in private possession and in urgent need of greater care, was a daughter house of Beaulieu, founded about 1231 by Bishop Peter des Roches. Its name is said to be Letley, derived from Laetus Locus (= beautiful spot).

In 1185 St. Julian's Hospital, God's House, was founded by Gervaise de Hampton and dedicated to God for the use of the poor. Edward III. gave the patronage and mastership to his Queen Philippa for her college at Oxford, and God's House still belongs to Queen's College. The hospital became very wealthy, and owned no less than 108 houses in the borough at the time of the French raid in 1338.

The Black Death came to Southampton in 1348. The town was nearly depopulated under its ravages, which are said to have deprived England of nine-tenths of its people. For ten years the customs were remitted to give opportunity for regaining prosperity. At this time the Preaching Friars were active in a material as well as a spiritual sense: they drained and purified the town, and it is said there are engineering works of theirs remaining to this day.

In 1346 no fewer than 1,600 ships are said to have sailed from Southampton with 32,000 troops, who fought victoriously at Crecy, the soldiers passing under the West Gate to embark. [In 1914 a far greater number embarked for the same battlefields in a smaller number of ships.] In 1539, in the Act for the dissolution of the monasteries, Southampton, Guildford, and the Isle of Wight were named as sees of suffragan bishops. Henry talked of founding twenty-three such: six only resulted. In 1556 Philip of Spain landed at Southampton with 160 sail. Here he stayed four days, attending Mass and drinking beer, while the Queen moved from Windsor to Winchester, where they were married.

In 1567 the Walloons, Celts of Flanders and the island of Walcheren, fled from the cruelties of the Spanish Inquisition in the Netherlands to Southampton. They desired that they might "live quietly and Christian-like," and



OLD TOWN WALLS ON WESTERN PARADE.

pursue their calling. "Lest, however, their coming should appear noisome and their occupation new and strange," they put their wishes in writing. They wished to have a church assigned to them in accordance with the doctrine of the Church of England, and asked for houses at a reasonable rent. Bishop Horne wrote to Cecil that they had undertaken that no corrupt religious acts or opinions shall be encouraged among them, and on his recommendation they were established in the chapel of God's House, with the sanction of Queen's College, Oxford. They were joined

by men of similar views from Northern France. For many years Presbyterian views prevailed among them, but from 1712 there was a desire to conform, and they are now ministered to by a priest of the English Church.

The year 1535 brings us to the time when the beautiful Tudor House was completed and occupied by Henry Huttoft. This citizen of Southampton was chief officer of the Customs, and the structure of the house shows that it served for the double purpose of dwelling and business premises. It is a very large building of four storeys, and the cellars are very extensive indeed. By the principal entrance access was immediately obtained to the Great Hall, having a length of 32 feet, but a partition has recently been erected to form a passage, thus obliterating the original plan. In the vaults Norman masonry may be seen, and, as Tudor House is adjacent to the Norman House, it has been suggested that the whole of the site was once covered by stone buildings of a pre-Norman and even pre-Saxon period.

Leland, Court Antiquary to King Henry VIII., remarks in his Itinerary that "there be many fair merchauntes houses in Hampton, but the chefest is the house that Huttoft, late custumer of Hampton builded in the west side of the town." Other four or five houses he mentions included one occupied by Guidote, an Italian. Now Huttoft was Mayor of the town in 1525 and 1534, and from the Burgesses' Book it appears that he conferred the dignity of burgess upon Anthony Guidotti, of Florence, without the consent of his brethren and contrary to the order of the town, and Guidotti was removed from the roll of burgesses in 1541. Guidotti was Huttoft's son-in-law, but a man of no principle; he absconded with money belonging to the King and to Huttoft. The story is a not uninteresting one, and occurs in the Letters and Papers of the Reign of Henry VIII., and is reproduced in the valuable account of Tudor House set forth by Professor Hearnshaw and Mr. R. Macdonald Lucas.

At the Revolution Southampton declared for the Parliament—after threats of bombardment, it is true. The Governor, Murford, set his chaplain to preach, and on the taking of the Solemn League and Covenant that "divine" thus prayed: "Bless the King, O Lord; mollify his hard heart, which delighteth in blood. Open his eyes, that he may see that the blood of his servants is dear in Thy sight." This pattern of Teutonic Protestantism domiciled in England no doubt emulated his "zealous brother in the ministry," who, when the organ and seats of Romsey Abbey and many other beautiful things were destroyed, got into the pulpit and for the space of two hours loudly applauded that *religious* act. Truly, we have had "frightfulness" in England ere this. At this time St. Michael's Church kept its regular Vicar during the first years of the Commonwealth, but a Presbyterian youth, Giles Say, was intruded, and in 1662 was rightly ejected.

NORMAN HOUSE.

The churches of Southampton are many, the majority, of course, being modern. The most beautiful is St. Michael's, standing in the centre of St. Michael's Square, seen at once from the High Street below Bar. Flanked on the south by the Tudor House, it presents a very vivid idea of the mediæval town. Its oldest part is the Norman base of the tower, a massive structure characteristic of the time, and yet without many counterparts among Norman remains in this country. But its heavy appearance is accentuated by the fact that it is enclosed in a parallelogram by the addition of chancel aisles and north and south aisles.

ST. MICHAEL'S CHURCH.

There was a time when some wooden buildings were attached to the church. These were set light to in the French raid of 1338, and fighting took place in the church itself, necessitating a Service of Reconciliation. The clock of St. Michael's set the time for the townspeople, and the bells of Holy Rood awakened them in the morning. The font of St. Michael's is one of a group of very similar appearance and construction, three of them found in Hampshire—at Winchester Cathedral, East Meon Church, and St. Michael's, Southampton. Others are to be seen in Lincoln Cathedral and at Ipswich. They are of black Tournai marble.

If St. Michael's Church is the most interesting, the mother-church, St. Mary's, is oldest in origin, although the present building is modern, the spire only just completed. It was designed by the late G. S. Street, and is a magnificent building. The first stone was laid by King Edward VII. when Prince of Wales.

Holy Rood was originally in the middle of the High Street, but was removed to its present site, given by Thomas de Bynedon, in the fourteenth century. The only portion of the old church is the tower, for the main body of the church was rebuilt in 1848. All Saints' Church is in the Classic style, built in 1795.

In the New Gallery, Shandwick Place, Edinburgh, there was opened on Monday last an interesting exhibition of facsimile reproductions of ancient Egyptian mural paintings, the proceeds from which will be wholly devoted to the Officers' Families Fund. The exhibition, which closes on the 16th inst., owes its initiative to the Rev. Colin Campbell, D.D., a well-known Egyptologist, who during several winters spent in the land of the Pharaohs had permission to trace in all their entirety a number of the mural paintings in old tomb-chapels at Thebes.

BUILDING STONES: THEIR MICROSCOPICAL STRUCTURE AND FORMATION.

SECTION I.

Written and illustrated by James Scott.

IT appears to me that architects would derive an advantage if they habitually studied the microscopical structures of the various stones which they advise the builders to use. In this way they would become acquainted with the composition of these things, and learn the reasons why some erections can almost indefinitely withstand weathering and similar influences, while others slowly crumble. Such knowledge could be increased by testing the sections in a chemical direction. The effects produced by climatic operations are really of a chemical character, the consideration of which

No. 1.—A view of Darley Dale stone, magnified through a space equal to a pinhole—about $\frac{1}{4}$th-inch diameter.

is as important as testing for stress and strain and kindred qualities.

It is not an easy matter to find a stone that possesses all the merits which are needed in a building stone of any value. Unless the stone is readily accessible and cheap, other points in its favour will be at once discounted. It must be tough, yet easy to cut; it must be strong enough not to split on account of the superstructure it may be called upon to carry; it must resist the changes of weather and be impervious to moisture; and it must be pleasing to the eye. When we come to examine the available stones we fail to discover many possessing all these merits.

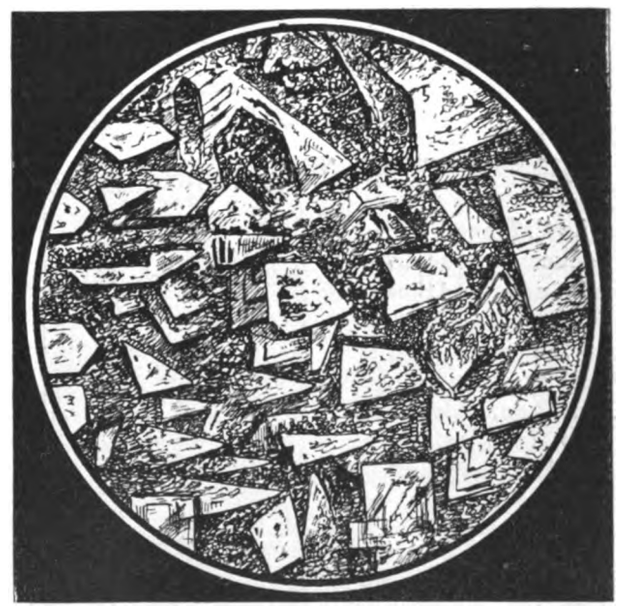
The continuous, systematic microscopical observation on stones would bring an intimacy with the science of petrology, which is also called petrography and lithology—a most interesting one, leading to the study of geology and mineralogy. Indeed, I should say that the *perfect* architect would be he who understood these overlapping branches of knowledge. It is remarkable how, when one learns something about one thing, there is a strong desire to pass to a connecting science, so that eventually a whole range of subjects is embraced. The initial or intuitive skill of designing would be strengthened by the acquisition of details bearing upon the materials used in erections.

You may meet with stones that have a very nice texture and tint at first, but which gradually exhibit irregular patches of discolouration. This behaviour is due to the fact that throughout the stone there happens to be a fine network, or connection, of softer grains, among which capillary action goes on, and smoky rain, or soil dampness, is unduly absorbed. In some cases there may be an actual chemical affinity, or attraction, between the linked-together particles of the stone and certain ingredients of the atmosphere. It is possible, of course, to meet with examples in which the natural inherent tendency to variegation exists, the native rock probably undergoing such changes simultaneously with the detached pieces which constituted the building, or portions thereof.

There is an immense diversity of stones—and of course the rocks whence they are quarried. Broadly speaking, they are divisible into three groups, depending on the manner of their formation—viz., igneous, sedimentary, and metamorphic. The igneous rocks are those which were once in a molten state—e.g., granites and basalts. The sedimentary rocks are those which have been formed by the gradual deposition of calcareous and kindred remains of animals in water, and by muds and sands—e.g., conglomerates and grits. The metamorphic rocks are those which contain features resembling both of the others, but are due to changes, amalgamations, and so on—e.g., schists and gneisses. It is quite impossible, in the space available to me, to adequately describe the exact properties of all these formations. Briefly speaking, igneous rocks have been caused by volcanic action; sedimentary rocks by oozes in oceans and lakes; and metamorphic rocks by a later mixture of both these productions.

A molten rock may undergo cooling and pressing for ages, minutely crystallising meantime, and then be cast up by earthquake agency and crumbled to dust by exposure. These remains, upon being washed by rains into waterways, eventually mix with the sediments or oozes of river and sea beds, and so help to form metamorphic rocks.

There are so many technical names for stones and their parent rocks that it is impossible to describe them all. I must reluctantly confine myself, principally, to the half-dozen definitely formed stones illustrated.



Among those stones which have not proved of any particular worth in buildings, after thorough testing, are basalt, diorite, dolorite, and serpentine, whereas the following are included in the group of highly serviceable kinds: granites, sandstones, many limestones, magnesian limestones, and similar formations.

Clays, shales, and the granular or chalky limestones have to be excluded from the list of suitable stones.

The granites, although so various in general texture and colour, always consist of masses of microscopical crystals (or pieces of the same) cemented together in an insoluble matrix of a siliceous nature.

Sandstones are composed of tiny grains of sand or quartz united by a similar bond of silica. These differ to a great extent, the evenly ferruginous, or iron-stained, ones being especially good. Calcareous sandstone—*i.e.*, containing lime—belongs to the same category of excellence.

Rejections in this class include the sandstones impregnated with pyrites (sulphide of iron) and with other iron combinations. These are very apt to discolour when in position. The colours of ferruginous, or iron-stained, sand-

No. 2.—A thin section of granite magnified in the space of a pinhole. From Mourne Mountain, Ireland.

stones pass from deep yellow, through brown, to red. Calcareous, or limy, sandstones are much too soft for building purposes, and are generally burnt for the manufacture of lime. The grey, argillaceous, or clayey sandstones, too, are not sufficiently hard for inclusion in erections. Pure sandstones, firm and unyielding, range from white to pale yellow.

The famous Darley Dale stone is a good example of grit, or metamorphic stone, and needs no advertising by me. The proprietors of the quarry whence it is obtained kindly sent me a sample of it for examination. It is a pleasantly drab-tinted stone, a microscopical surface view of which is given in No. 1. Its minutely sparkling effect is due principally to the presence of spangles of mica, but there are many other minerals which help to produce its close-grained texture. The unique effect of its surface is due to the neatly mixed assortment of crystals and amorphous matter, the tints, lights, and shades being well blended.

An attractive specimen of grey granite is that shown in No. 2, obtained from Mourne Mountain, Ireland. The paler parts are quite transparent, and when light is allowed to pass up through this slice of stone the greyness is seen to be occasioned by myriads of infinitesimally minute specks

No. 3.—A thin section of avanturine magnified in the space of a pinhole

of matter which, although obviously separate, still help to hold the overlapping crystals together.

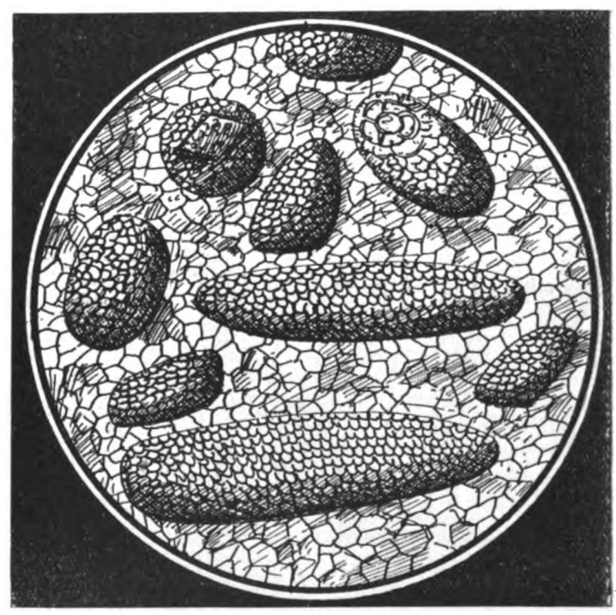
In this connection it is worth recording that it is possible to pick away the crystals and other particles of a hard stone by means of a needle point, and when the action is observed during magnification it makes the material look very friable. It does not necessarily follow, of course, that the stones would crumble in this way. Indeed, in hot weather it is quite possible that many of the particles would get softened and help to block up little pores which would otherwise let in the moisture. But at present I am not discussing this problem. Avanturin is used principally for the ornamental parts of buildings. In general appearance it presents a coppery lustre, due to patches of indefinite red particles, and crystalline plates of browned or blacked mica, and when viewed microscopically is like the section shown in No. 3. It is often harder than steel. The best kind emanates from the Ural Mountains, Russia, but India possesses a green variety of the stone. In the Museum of Practical Geology, London, is a vase 4 feet high sculptured from a single block of this remarkable substance.

All the illustrations have been drawn to the same scale of magnification, each circle representing an original space only $\frac{1}{21\frac{1}{2}}$-inch in diameter.

SECTION 2.

Limestones have proved of very great utility for building purposes, but in choosing them a great amount of discrimination needs to be exercised. Broadly speaking, they are composed of calcium in various combinations, principally as a carbonate—*i.e.*, carbon dioxide and lime. By the way, it may be pointed out that when crushed they are serviceable to the mineral water manufacturer, because of the fact just mentioned. Upon submitting any form of limestone—marble, chalk, &c.—to the action of an acid brisk effervescence ensues, and the gas named is at once liberated. This gas is variously called carbonic acid, carbonic anhydride, carbon dioxide, CO_2, and is that with which aërated waters are impregnated. This extreme liability to disintegrate when in contact with acids has a direct bearing on the stones when regarded from the point of view of the architect and builder.

The rains of towns and cities are frequently rich with gases derived from the decomposition of smoke, and, when the stones are continually drenched, are caused to percolate through them and dissolve out particles of lime, to the detriment of the whole structure. They are apt to crumble to pieces if continually exposed to the action of rain when it contains a large percentage of carbonic acid gas.



Limestones are seldom quite pure, among the chief defects being silica in the form of quartz, flint, and chert. In other stones silica is regarded as a meritorious ingredient, but in limestones its particles are apt to get loosened, and by constant friction against the soft calcium gradually wear the stone into a porous condition. A sandstone is practically all silica, but that is far different from a soft stone containing scattered specks of silica. The one is densely compact, the other more friable in consequence. A coat of armour would be durable, whereas a cloth coat containing a lot of tintacks would soon be ruined.

Some limestones weather admirably, but others disintegrate more rapidly than is good for the building of which they constitute a part.

There are so many limestones that it has been found necessary to name them after the abundance of the fossil remains which they contain. I cannot go into the details of this nomenclature, nor would it be of much use if I did so.

Limestones are often stained by iron oxide (rust is the familiar form of this substance), and by admixtures of a bituminous or asphaltic nature. Occasionally clay combines with the stone, thus constituting a marl, which is practically useless to the builder.

Two very different kinds of structure can be found in limestones. First we have the crystalline, or strictly mineral, formation, and then the organic. These definitions need a few words of explanation, so that there shall be no confusion in connection with any of them. Mineral substances comprise a large proportion of the anatomy, &c., of most living creatures, but in these cases they are referred to as organic in source because they have been associated with organisms. Fundamentally, however, one cannot distinguish much chemical contrast between the two kinds as found in rocks. In life the organic particles are compounded with gelatinous or

No. 4.—A thin section of Durham dolomite (magnesian limestone) magnified in the space of a pinhole.

slimy matters, but this is soon decomposed and washed away from the defunct creatures. Sometimes, however, certain ingredients may remain, and by becoming distilled settle as oily substance possessing a kerosene odour. But this would in due time evaporate. Its tendency is to harden the limestone.

With regard to shaping, however, there certainly can be detected many points of variance when the microscope is used in their investigation.

The crystalline limestones disclose, as their name implies, a mass of tiny crystals, whereas the organic limestones consist mainly of shells, corals, crinoids, bones, and kindred

Digitized by Google

Digitized by Google

calcareous fossils. Now it is a very curious fact that the organic calcium may become partly or wholly crystallised, but there nearly always remain sufficient details for their proper classification to be made.

The limestones are generally pale yellow in tint. The thickest beds or deposits are found in Yorkshire and Durham, and it was from the latter county that I obtained the sample of which a section is depicted in No. 4.

Bath stone and Portland stone are limestones.

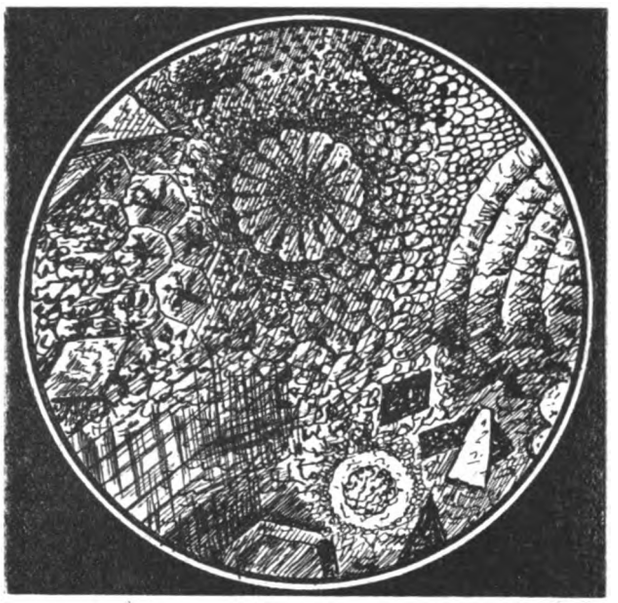
Some limestones contain magnesia as well, and if the quantity of this material is at all noticeable the substance is referred to as magnesian, or magnesium, limestone. A prominent member of this class is called Dolomite, because of the large percentage of carbonate of magnesia which it contains. A section is depicted in No. 4.

It appears to be full of gas spaces covered in by smaller granules than those found in between them. It is a debatable point whether these parts have once been occupied by minute fossils, or pieces of the same, which were afterwards soaked out from them, leaving casts behind, or are simply cavities due to chemical reactions. The former view appears to be the most feasible. Seeing that one may completely alter the formation of a section by means of acids, alkalies, and so on, we cannot be quite sure on any of these subjects.

Dolomitic limestone is often met with in aggregated masses about the size of cannon shot.

It should be understood that the microscopical views of a stone are very similar to one another in whatever direction they may be cut. The manner in which the various items are mixed together is often very curious and striking. With regard to the crystalline structures, the crystals often blend one into another so beautifully that no distinguishing junctions are left. They cross over each other so as to produce a great variety of patterns, and in many cases appear like pretty miniature mosaics. No. 5 gives a very good idea of the formation of the best kinds.

A stone of very elegant internal design is that called Permian Breccia, a slice of which is shown magnified in No. 6. The name Permia is derived from Perm, Russia, and has a bearing on the geological style and disposal, &c.,



No. 5.—A thin section of limestone from Llandovery magnified in the space of a pinhole.

of the beds composing that particular formation. Permian rocks exist in Great Britain. The Breccias are found to be minutely fractured, thereby producing a somewhat granular effect. Many minute fossils can be found, some of which are depicted in the illustration. Their actual sizes can be gathered by bearing in mind the diameter of the circle before magnification—viz., $\frac{1}{24}$ inch, or that of a mere pinhole.

The Breccias appear to have been produced principally by the grinding together of huge masses of igneous rocks, and the washing away and dispersal of the fragments among the organic ooze on the beds of oceans and lakes.

Some have been partly formed by means of hot molten lava entering seas and becoming split into angular scraps, which then subsided to the bottom and amalgamated with the corals, shells, and so forth, which were already in existence.

No. 6.—A thin section of Permian Breccia magnified in the space of a pinhole. From Alderbury, Salop.

Another method which produced them was the action of glaciers travelling slowly between rocks which they denuded, the minutiæ afterwards settling in the organic débris. Of course, subsequent drainage and hardening by pressure occurred.

It has been found preferable to lay building stones in their bedding planes. That is to say, if they are placed in a position corresponding with that in which they were quarried, they will serve their purpose much better than when they are irregularly fixed. This trait, no doubt, has something to do with the fact that they are generally formed layer upon layer, and are subjected to greater pressure in one direction than in another.

For the purposes of making the sections from which the drawings were produced, small pieces of the respective rocks were ground down until they were as thin as paper, and thus displayed their inner structure admirably.

TESTS OF BOND BETWEEN CONCRETE AND STEEL.*

(Continued from last week.)

(24) THE tests with plain round bars anchored by means of nuts and washers and with washers only showed that the entire bar must slip an appreciable amount before these forms of anchorage come into action. Anchorages of the dimensions used in these tests did not become effective until the bar had slipped an amount corresponding to the maximum bond resistance of plain bars. With further movement the apparent bond resistance was high, but was accompanied by excessive bearing stresses on the concrete.

(25) The load-slip relation for bars anchored by means of hooks and bends was not determined. The high resistance given in these tests was probably a result of the bearing stresses developed in the concrete ahead of the bends.

(26) Tests on specimens stored under different conditions indicate that concrete stored in damp sand may be expected to give about the same bond resistance and compressive resistance as that stored in water. Water-stored specimens gave values of maximum bond resistance higher in each instance than the air-stored specimens; the increase for water storage ranged from 10 to 45 per cent. The difference seemed to increase with age. The presence of water not only did not injure the bond for ages up to three years.

* **Abstract from Bulletin of the University of Illinois, U.S.A., on "Tests of Bond between Concrete and Steel." By Duff A. Abrams.**

Canadian Trade!

Referendex

TORONTO, CANADA.

NATURE OF PUBLICATION.

The text of Referendex consists of construction data and specifications covering every department of building construction, information the architect and engineer must have. No effort is made to present a treatise on any subject. Such is properly the function of the text book. We assume that the user knows his business and our aim is, then, to provide a convenient and complete memorandum of the working data of construction and, where possible, general specifications or specification clauses following the best modern practice. Great care is taken throughout to make the text reliable. A bibliography concludes each section.

The text is separated into departments, and each section is correlated with the advertising of companies or individuals from whom the product dealt with may be purchased. Such advertising is the natural supplement of the purely technical when, as in REFERENDEX, it shows the extent to which theory may be carried into practice. Each advertiser is asked to prepare his copy in such a way as to impart a maximum of information concerning his products, emphasising the utilitarian aspect of the book, so that the user is free to make his selection of materials from our pages on the merits of the products.

USEFULNESS.

Utility is the master-key of modern business, and utility is the fundamental of REFERENDEX.

No structure is ever planned without recourse to various technical data and related advertising, and until the advent of our publication reference was necessary to many sources of information and a multitude of catalogues if an intelligent design was to be attained.

Which is logical: to secure required information from one volume systematically arranged and thoroughly indexed for ready access to every department, or to use many separate works of doubtful convenience and a never complete library of catalogues?

Obviously the combining in one volume of the essential data concerning each branch of work makes for the convenience and pleasure of the user. And it is in this combination of the text book and the catalogue that REFERENDEX is unique. Modern architectural practice demands not only a knowledge of the theory of construction, but an intimate knowledge of the many patented and manufactured materials and appliances which constitute so important and an ever increasing part of all building. Here again REFERENDEX holds value for its readers in the wide range of the subject matter of its advertising.

REFERENDEX vs. CATALOGUES.

Those who are familiar with the average drafting room know with what an astonishingly meagre supply of catalogues the design of a building is sometimes worked out. This is possible because there are a number of very common materials which may be used in almost any building. But immediately the designer has a wish to bring his work in line with the modern trend, he becomes dependent upon the advertising of periodicals for information relating to the newest materials and processes.

A catalogue which is not kept is worse than useless—a catalogue kept, but forgotten, is nearly useless—a catalogue kept, remembered, but lost in a pile of others, is a nuisance—a catalogue in use is worth more than its weight in gold. The chances of uselessness, however, are high. They are further increased by the fact that very few firms can indulge in broadcast circulation.

This, then, is the "catalogue problem." It is solved by REFERENDEX. Unlike catalogues and literature, an announcement in it is not publicity for a short, indefinite period. Our publication reaches 3,000 architects, engineers, builders and contractors. It is kept by these 3,000 members of the building interests for 365 days. Kept because it is a limp-leather covered hand-book which is a veritable treasure house of information pertaining to their business.

REFERENDEX circulation is positively definite. REFERENDEX is too big and handsome to get lost on the shelves. REFERENDEX is not so big as to be unwieldy. REFERENDEX is indexed and cross-indexed. Its information is as accessible as a book can make it. In short, our publication does most of the work of the ideal catalogue, and at a much lower cost.

EASE OF REFERENCE.

The size of our publication makes it an ideal one for its purposes. Cumbersome volumes can never find a place on the drafting table. They may offer the advertiser a large page for the display of his announcement, but in doing so defeat their own object, which is utility in the designing room. A work of this nature to be practical must be of a size allowing it to be in active use. An architect working out plans and specifications wants his information where he can refer to it instantly. This demands a volume of compact size. REFERENDEX, an ideal size, 11 inches by 7 inches, allows it to become part of the actual equipment of the office.

OUR ORGANISATION.

In every organisation the policy which governs its attitude toward those with whom it deals is the determining factor in its success or failure. The policy of REFERENDEX COMPANY, LIMITED, is broad, founded on the basis of giving more than the actual contract calls for. The possibilities of our organisation have been carefully considered. We have got on an elevation and judged results in the aggregate rather than in the individual case. Every assistance and service possible is rendered our advertisers and the users of our publication.

Every department of the organisation is in charge of practical, experienced men—men qualified by special fitness to handle the work to which they are assigned. The publication is conducted without fear or favour. All advertising copy is subject to the approval of the publishers. Users are assured that to the best of our knowledge and ability nothing is advertised in our pages which is not as represented.

LOW COST.

The amount of investment in any advertising should be one of the determining factors, and in this respect REFERENDEX is splendidly situated. Our rates are lower, considering the quality and duration of circulation, than those of any medium reaching the building interests. These rates mean a page announcement can be placed before each of the desirable individuals and firms who use REFERENDEX at a cost of two cents each. The more pages the lower the rate.

This is lower than the cost of one letter, and considerably less than it would cost to have the same matter printed and sent out. On this basis the user of our publication would need to read an advertisement only once to give the advertiser the publicity obtained from a letter or circular. Announcements in REFERENDEX are, however, referred to many times by the users. Our manual remains as a valued work in their offices every day in the year. Dollar for dollar of advertising values it is by far the best publication in its field in Canada.

GILBERT WOOD & CO., LTD., Publishers, 6-11 Imperial Buildings, Ludgate Circus, London, E.C.

Digitized by Google

but it was an important factor in producing conditions which resulted in high bond resistances. However, it was found that specimens tested with the concrete in a saturated condition gave lower values for bond than those which had been allowed to dry out before testing. The bars in specimens which had been immersed in water as long as three and one-half years showed no signs of rust or other deterioration.

(27) Specimens made out-doors in freezing weather, where they probably froze and thawed several times during the period of setting and hardening, were almost devoid of bond strength.

(28) Pull-out tests made at early ages gave surprisingly high values of bond resistance. Plain bars embedded in 1-2-4 concrete and tested at two days did not show end slip of bar until a bond stress of 75 lb. per square inch was developed. Bond resistance increases most rapidly with age during the first month. The richer mixes show a more rapid increase than the leaner ones. The tests on concrete at ages of over one year showed that the bond resistance of specimens stored in a damp place may be expected ultimately to reach a value as much as twice that developed at 60 days.

(29) The load-slip relation of leaner and richer mixes was similar to that for 1-2-4 concrete. For a wide range of mixes the bond resistance was nearly proportional to the amount of cement used. This relation did not obtain in a mix from which the coarse aggregate had been omitted.

(30) When the application of load was continued over a considerable period of time, or when the load was released and reapplied, the usual relation of slip of bar to bond resistance was considerably modified. The few tests which were made indicate that the bond stress corresponding to beginning of slip is the highest stress which can be maintained permanently or be reapplied indefinitely without failure of bond. The effect of continued and repeated load, impact, &c., may well be the subject of further experimental study.

(31) Little difference was found in the pull-out tests whether the load was distributed over the entire face of the block or over a narrow ring at the centre of the block or around the edge of the face of the block.

(32) Specimens moulded in a horizontal position gave lower bond resistance than those moulded in a vertical position; when settlement of the bar with the settlement of the concrete was entirely prevented, the bond resistance was reduced to about 60 per cent. of that found for similar specimens which were moulded with the bars in a vertical position. Plain bars tested by being pulled in the same or the opposite direction from the settlement of the concrete during setting gave about the same bond resistance, but in the tests of certain deformed bars this was not true.

(33) The term "autogenous healing" is used to designate phenomena observed in pull-out tests and in compression tests of concrete cylinders in which the hardening of the concrete was interrupted by loading the specimen at early ages to its ultimate resistance. Up to an age of one year the bond resistance of specimens stored in damp sand was not affected by as many as four loadings at intervals during the period of storage up to the ultimate resistance. For specimens stored in air and tested in the same way, the bond resistance was less than for damp-sand storage, but the tests showed a steady increase in bond resistance with each loading up to three months. Specimens which had been stored in air for two months before the first test and in water thereafter showed a decrease in bond with each subsequent loading, although the bond resistance in the last test was fairly high. The presence of water apparently permits the continuation of the hydraulic action of the cement for several months after the mixing of the concrete.

(34) Bond resistance of plain bars is greatly increased if the concrete is caused to set under pressure. With a pressure of 100 lb. per square inch on the fresh concrete for five days after moulding, the maximum bond resistance was increased 92 per cent. over that of similar bars in concrete which had set without pressure. The greater density of the concrete and its more intimate contact with the bar seems to be responsible for the increased bond resistance. Light pressure gave an appreciable increase in bond resistance. With polished bars the effect of pressure was slight.

(35) As might have been expected, the compressive resistance of concrete setting under pressure was increased in much the same ratio as the bond resistance. At the age of eighty days the initial modulus of elasticity in compression for concrete which set under a pressure of 100 lb. per square inch was about 37 per cent. higher, and the compressive strength was increased by about 73 per cent. over that of concrete which had set without pressure. The density of the concrete, as determined by the unit weights, was increased about 4 per cent. by a pressure of 100 lb. per square inch on the fresh concrete. The increase in strength and density was relatively greater for the low than for the high pressures. A pressure continued for one day, or until the concrete had taken its final set and hardening had begun, seems to have produced the same effect in increasing the strength and elastic properties of the concrete as when the pressure was continued for a much longer period.

(36) Concrete cylinders tested in compression at age of eighty days after having been loaded to failure at seven days gave compression strengths nearly as high as those tested for the first time at the same age. Retests of cylinders which had set under pressure gave similar results.

(37) Beams of comparatively short span reinforced with bars of large size were used in order to develop high bond stresses and give bond failures. Most of the beams failed in bond; a few failed by a combination of bond and diagonal tension or by tension in the steel.

(38) The usual method of computing the bond stress in a reinforced concrete beam does not take account of all the phenomena of bond action. Slip of bar due to beam bond action and the presence of anti-stretch slip may be expected to greatly modify the distribution of bond stress over the length of the bar, and otherwise to affect resistance to beam bond stresses. However, the nominal values for bond resistance, computed by the usual formula, form a useful basis for comparison in beams in which the dimensions and general make-up are similar.

(39) Slip of bar was a phenomenon in all beam tests in which careful slip observations were made. These load-slip relations give important indications as to the bond stress developed at points along the length of the beam.

(40) Slip was first observed in the middle region of the span at loads producing a tensile stress in the steel of about 6,000 lb. per square inch. In this region the shear is zero, and hence beam bond action, as usually understood, is absent. As the load was increased, slip of bar progressed through the outer thirds towards the ends of the beam at a rate nearly proportional to the increase of load. After slip occurred at the ends, the outer thirds of the length of the bar moved towards the middle of the span relative to the adjacent concrete. Slip of bar was probably partly responsible for the opening of outer cracks, since slipping was observed in the outer thirds of the beams before the cracks became visible.

(To be concluded.)

Any of the above specifications may be obtained from J. D. Roots & Co.

Correspondence

[The Editor will not be responsible for the opinions expressed by Correspondents.]

Whitby Abbey.

SIR,—The damage to Whitby Abbey caused by the bombardment of December 16 is described in the following report, which I am communicating to the Society of Antiquaries.

The west end of the nave has suffered most. This is the latest part of the church, dating from the early years of the fourteenth century, and its condition before the bombardment was as follows: The lower part of the west wall of the nave itself was standing up to the level of the sill of the great west window; the west doorway was complete, except its central column and part of its tympanum, and on each side of the doorway, on the inner side of the wall, was a wall-arcade of similar character to those of the nave aisles of York Minster and the west end of Howden Church. The western respond pier of the north arcade of the nave remained its full height, with its capitals and the springing of the arcade arch, and behind this was a newel-stair. The north jamb of the great west window remained its full height up to the springing, attached to the wall and buttress containing the stair. The west wall of the north aisle was fairly complete to its full height, except that the window had lost part of its tracery, which, like the great west window of the nave, was an insertion of the fifteenth century.

The arch of the west doorway and the walling above it have been destroyed. The wall-arcades on either side of the doorway have collapsed, leaving the rubble core of the wall—except a small fragment at each end, north and south. The north jamb of the great west window has fallen, with the whole of the eastern half of the stair, down to below the capitals of the respond pier. The south half of the inner arch of the west window of the north aisle has fallen, and what remained of its tracery has been dislocated. Much of the north face of the buttress in line with the west wall of the aisle has been stripped off.

Elsewhere the church has suffered some lesser injuries. The gable-end of the north transept is flanked by turrets rising from great buttresses; on the eastern of these the upper arcade has lost one of its arches and small gables, and one of the gables of the lower arcade has lost its apex stone; the wall around the eastern angle of the buttress at the latter level shows signs of having been struck, and some surface damage, and the blow seems to have brought down two arch stones from the north side of the bay of the east clear-storey of the transept next the crossing. One of the main piers of the north arcade of the choir, the fourth from the east end, has been struck, and the capitals of two of its shafts on its north-east side have been shattered. Otherwise the beautiful choir has fortunately almost entirely escaped injury.—Yours, &c.,

JOHN BILSON, F.S.A.,
Local Secretary for Yorkshire of the Society of Antiquaries.
Hull, January 7.

Belgian Chamber of Commerce in London.

SIR,—The Belgian Chamber of Commerce in London (Incorporated), 24 St. Dunstan's Buildings, St. Dunstan's Hill, E.C., appeals to the British manufacturers and merchants for support.

It has rendered valuable services since 1890 to industries and commerce between the two countries. Since the beginning of the war their task has become much more arduous through all the various questions due to the difficulties of trade.

After the cessation of hostilities they will have very important duties to perform in helping the commerce of the two countries, which are now bound up more than ever in ties of mutual trust and friendship, by bringing together manufacturers and buyers of goods and in many other ways. But they find great difficulties in carrying out their duties through lack of funds, as the call upon them has been greater than ever before, and their Belgian supporters are unable now to send their usual remittances.

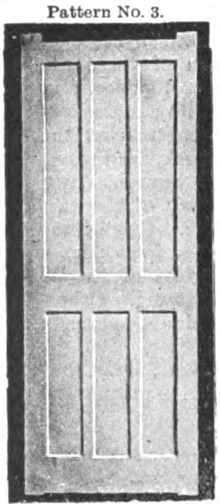
Applications for membership and contributions should be sent to

Yours faithfully,
PAUL DORCHY,
The General Secretary, Belgian Chamber of Commerce in London (Incorporated).
24 St. Dunstan's Buildings, St. Dunstan's Hill, E.C., London.

Municipal Trading.

SIR,—Your "Note" in the current issue of your valued weekly, respecting the proposal of Edinburgh Corporation to seek powers to trade in electrical fittings, draws attention to a very reprehensible tendency in municipalities at the present day. The matter is one for condemnation from a higher standpoint than the mere architect's; it is one that affects the ratepayer *qua* ratepayer; and—in the present instance—it also adversely affects a well-deserving trade. But it is larger even than the effect upon any one trade, for the whole matter of municipal trading is initially wrong, except to the extent that the general public weal is concerned. Municipal trading saps the healthy spirit of competition, speculates in public money unjustifiably, having everything to win and not much to lose (when compared with private trading), and is an extension of the principle of centralisation, which is so utterly opposed to the present-day polity.—Faithfully yours, ARCHITECT.

Kensington, January 1915.



Westminster Cathedral

SIR,—The first paragraph in your Notes and Comments last week is an interesting description of the beautiful work which is gradually being installed. Might I respectfully draw the attention of the cathedral authorities and the architects to the fact that we have in this country beautiful marbles and decorative stones, and that they might surely give preference to British materials, for a British building, whether it be known as Roman Catholic, Church of England or any other sect? I have quite recently had my attention called to some delightful examples of pure white marble, also some of a creamy nature, a British production from British quarries; also a delightful pale green and a Welsh stone of various colours and granite nature which for decorative effect cannot, I am sure, be surpassed.—I am, your obedient servant, BRITISHER.

London, W.C., January 10, 1915.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addresed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than* 2 P.M. *on Thursdays.*

COMPETITIONS OPEN.

BRADFORD.—March 31.—The Corporation invite competitive designs for the re-planning of streets in the central area of the City of Bradford. Mr. Reginald Blomfield, R.A., will act as assessor. Particulars may be obtained on application to the undersigned, accompanied by a deposit of £1 1*s.*, which will be returned on receipt of a *bonâ-fide* design. Mr. Frederick Stevens, Town Clerk, Town Hall, Bradford.

COVENTRY.—The City Council invite competitive sketch plans for the erection of a public elementary school at Folly Lane, Coventry. The competition is strictly limited to architects practising in the City of Coventry. Particulars of the competition may be obtained on application at the Education Office, 44 Bayley Lane, Coventry.

DONCASTER.—Jan. 23.—The Town Council invite architects to submit designs for the laying out of a site of about twenty acres at Carr House, Doncaster, and the erection of 102 workmen's dwellings on four acres thereof on Garden City lines. Copies of the particulars and conditions of the competition may be obtained at the office of Mr. R. A. H. Tovey, Town Clerk, Doncaster.

LIVERPOOL.—Feb. 8.—The Corporation invite designs for workmen's dwellings, to accommodate about 500 persons, and proposed to be erected on the site known as the Rathbone Street area. Premiums of £100, £50 and £25 respectively are offered for the first three selected designs, and the Council have appointed Mr. Henry Hartley, F.R.I.B.A., as assessor. The first premiated design will become the property of the Corporation. A plan of site, together with a copy of the printed conditions and instructions, will be forwarded to the applicant on payment of a deposit of £1 1*s.*, which will be returned on the receipt of a bona-fide set of drawings. Mr. E. R. Pickmere, town clerk, Municipal Offices, Liverpool.

MACCLESFIELD.—Jan. 31.—The Lands and Town Development Committee invite competitive plans, &c., for a housing scheme from the local architects and builders. Plans, specification, and estimate must be deposited not later than January 31, 1915, marked on the outside cover, "Housing Scheme." Mr. S. C. Baggott, Borough Surveyor, Macclesfield.

CONTRACTS OPEN.

ANGMERING.—Jan. 25.—For erection of four cottages at Angmering, Sussex, for the East Preston Rural District Council. Mr. A. Shelley, clerk, Town Offices, Littlehampton.

ASTON-BY-STONE.—Jan. 26.—For erection of a farm institute at Aston-by-Stone, comprising model farm, dairy, hostel, principal's house and cottages, for the Staffordshire Education Committee. Send applications and £2 2*s.* deposit by Jan. 26 to Mr. Graham Balfour, director of education, Stafford.

BACUP.—Jan. 23.—For erecting a propagating house, and also for alterations to certain buildings to form pavilions at the Moorlands and Stubbylee Park for the Corporation. The Borough Engineer's Office, Bacup, Lancs.

BISHOPSTOKE.—Jan. 19.—For erection of offices for 305 children on the site for Bishopstoke new Council school, for the Hampshire County Council. Deposit 10*s.* 6*d.* Mr. A. L. Roberts, architect to the Education Committee, The Castle, Winchester.

BRISTOL.—Jan. 18.—For plastering, painting, &c., ward 162 and staircase, bathrooms, &c., adjoining, at the Eastville institution, for the Guardians. Mr. J. J. Simpson, clerk, St. Peter's Hospital, Bristol.

BURY.—Jan. 30.—For construction of an extension to reinforced concrete retaining wall at the electricity generating station, Chamber Hall, for the Corporation. Deposit £2. Mr. J. A. Settle, A.M.I.C.E., borough engineer, Bank Street, Bury, Lancs.

BUXTON.—For the rebuilding of Devonshire Laundry, Bridge Street, for Messrs. Oram. Messrs. Garlick & Son, architects, Quadrant, Buxton.

COLCHESTER.—Jan. 20.—For erection of tuberculosis pavilion, scarlet-fever ward, and alterations and additions to the administration block at the Infectious Diseases Hospital, Mile End, for the Borough and Port Health Committee. Mr. H. Collins, A.M.I.C.E., borough engineer and surveyor, Colchester.

DARWEN.—Jan. 20. For erection of proposed baths, Railway Road, for the Health Committee. Separate tenders may be submitted for general builders' work, plastering, painting, slating, plumbing and glazing. Mr. R. W. Smith Saville, C.E., borough surveyor, Darwen.

ROCHDALE.—Jan. 27.—For erection and completion of repair shops in Mellor Street in the following trades, for the Tramways Committee: (*a*) reinforced concrete foundations and car platform; (*b*) steelwork (steel frame); (*c*) builders' work. Mr. P. W. Hathaway, A.R.I.B.A., Town Hall, Rochdale.

ST. HELENS.—Feb. 23.—For erection of a refuse destructor, together with all contingent works, at the Parr Depôt, within the borough. Deposit £2. Mr. A. W. Bradley, M.Inst.C.E., borough engineer, Town Hall, St. Helens.

SCOTLAND.—Jan. 20.—For the following works in connection with alterations to be carried out at No. 43 Lauriston Place—viz.: (1) Mason work, (2) joiner work, (3) plumber work, (4) plaster work, for the Edinburgh School Board. The School Board Offices, Castle Terrace, Edinburgh.

SCOTLAND.—Jan. 26.—For mason, concrete, and brick work, carpenter and joiner work, plumber and slater work, steel and iron work, cement and rough casting, and painter work of buildings proposed to be erected at Greenhead Filters, for the Irvine and District Water Board. Deposit £1. Mr. H. Thomson, architect, Saltcoats.

SCOTLAND.—Jan. 27.—For the following work required in connection with the reconstruction and extension of Couper Institute, Cathcart, for the Glasgow Corporation—viz.: (1) Digger, mason, brick, and steel works; (2) carpenter, joiner, glazier, ironmonger, and iron-roofing works; (3) plumber work; (4) lath and plaster works; (5) slater work; and (6) tile work. The Office of Public Works, 64 Cochrane Street, Glasgow.

SEATON DELAVAL.—Jan. 28.—For erection of a police station, for the Northumberland Standing Joint Committee. Deposit £2. Mr. J. A. Bean, county surveyor, Moothall, Newcastle-on-Tyne.

SLAITHWAITE.—Jan. 22.—The West Riding Education Committee invite whole or separate tenders for the following works at the Slaithwaite Mechanics' Institute: fitting up as special subjects' centre (builder, joiner, plumber and painter). The Education Architect, County Hall, Wakefield. Send £1 deposit by separate letter to the West Riding Treasurer, County Hall, Wakefield.

SUMMERSEAT (LANCS.).—Jan. 20.—For works required in alterations and additions at the Summerseat House municipal special school, Summerseat, near Bury, for the Manchester Education Committee, each section to be let separately as follows: (1) excavator, drainer, concretor, and bricklayer; (2) stonemason; (3) slater; (4) carpenter and joiner; (5) supply of cast-iron work; (6) plumber and glazier; (7) plasterer and painter. Deposit £1 1*s.* Education Offices, Deansgate, Manchester.

TOWCESTER.—Jan. 27. For erection of refreshment rooms at Towcester, for the Stratford-upon-Avon and Midland Junction Railway Co. Deposit 10*s.* 6*d.* Messrs. Knight & Hebery, architects, 5 Rother Street, Stratford-on-Avon.

UPHOLLAND.—Jan. 30.—For erection of eight workmen's dwellings, for the Upholland Urban District Council. Deposit £1 1*s.* Mr. A. Hunt, surveyor, Council Offices, Upholland, Lancs.

WALES.—The Breconshire County Council invite tenders for the following works—viz.: Builth Bridge, widening, &c. (*a*) widening in stone and ferro-concrete, and (*b*) widening entirely in stone; Saleyard Bridge (near Gilwern), improvement, new bridge and road diversion; Clydach Bridge (near Brynmawr), widening. Mr. C. W. Best, M.I.C.E., county surveyor, County Hall, Brecon.

WALES.—Jan. 20.—For erection of two shops and alterations to an existing shop at Abertridwr, for Mr. F. Hawkins, Pontypridd. Deposit £1 1*s.* Messrs. A. O. Evans, Williams & Evans, architects, Pontypridd.

WARRINGTON.—Jan. 19.—For the supply and erection of six cast-iron ornamental tramway shelters at the various tramway termini, for the Electricity and Tramway Committee. The Borough Surveyor, Town Hall, Warrington.

WEYMOUTH.—Jan. 25.—For extension of Weymouth Post Office, for the Commissioners of H.M. Works and Public Buildings. Deposit £1 1*s.* The Postmaster, Weymouth, and H.M. Office of Works, &c., Storey's Gate, S.W

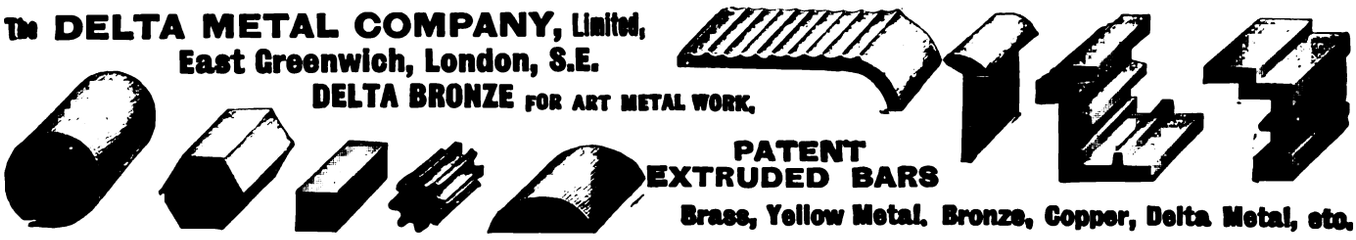
THE SANITARY ASPECT OF ELECTROLYSIS.

THE successful employment of electrolysers for bleaching, laundry, medical, and sanitary work has long been an accomplished fact, but, the application being technical and the process withal very simple, little of what is being done has found its way into the Press.

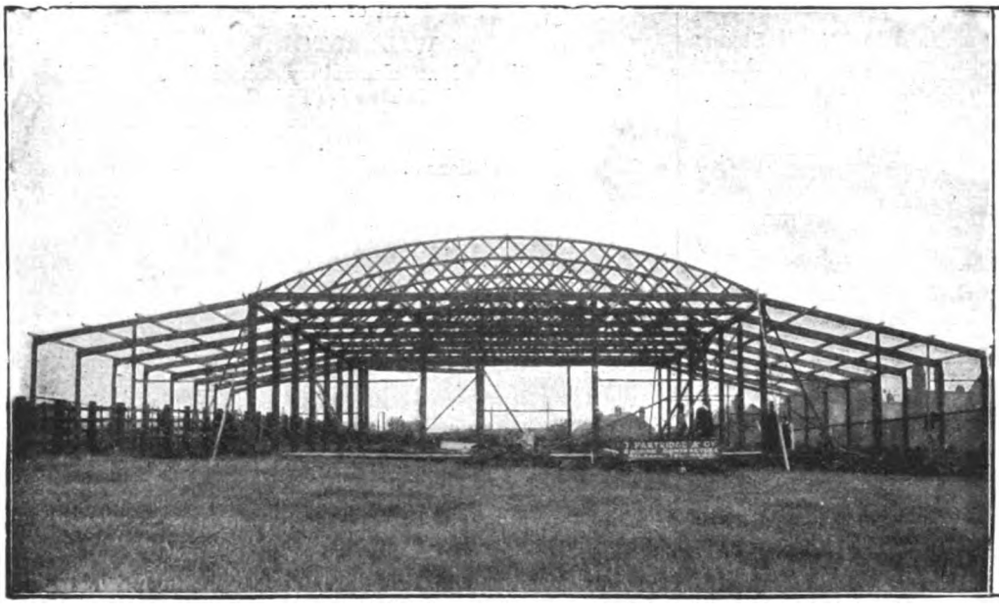
Electrolysers are employed to convert ordinary salt water into what is termed electrolytic sodium hypochlorite by sending a current of electricity through it. This decomposes the brine, setting free clorine, oxygen, hydrogen, &c.: the hydrogen escapes into the atmosphere, the chlorine combines with the oxygen to form hypochlorite, which has powerful oxydising properties, but it is very unstable—i.e. it readily parts with its oxygen again.

This hypochlorite as coming from the electrolyser is neither acid nor alkaline, and this is the cause of its instability, or tendency to form combinations with other bodies: either the chlorine or the oxygen is always ready to leave the other element and form fresh alliances. The more unstable the compound, the more rapidly and energetically it acts; therefore the oxygen in this form is one of the most powerful bleaching agents that we have, and it is also a most valuable steriliser—we use this term advisedly in place of the hackneyed word "disinfectant" (a steriliser destroys beyond regeneration organic matter and germs; a disinfectant merely covers up one smell by another and more powerful one—the offending matter is not necessarily destroyed beyond resuscitation). It is far more powerful than carbolic acid in whatever form made up, and is practically equal to perchloride of mercury; it is also cheap to produce.



USES OF THE LIQUOR.

In the Laundry.—One bucketful, or two gallons, of the liquor as made is thrown into the washing machine, and twenty gallons of soapy-water added, clothes thrown in, and washing proceeds as usual. The liquor does not curdle soap; it rather promotes lathering, so less soap is used. Many laundries prefer to add the electrolytic liquor to the cold breakdown, in which case it may be used slightly stronger.



Chlorine has a remarkable affinity for nitrogenous and albumenous matter, under which headings come sweat, composed of lactic and uric acids, and other excretory products of the human body, combined with dead skin dust, which is of albumenous origin. The action of the hypochlorous acid is of a twofold nature, the molecule of oxygen which combined with the chlorine leaves its base and attacks the soluble colouring matters present, oxydising and destroying them. To this extent it does the work chemically better than soap, which only acts mechanically.

The chlorine set free combines energetically with the albumenous matter, which escapes the action of the oxygen, forming an insoluble compound along with ammonia and nitrogenous matter present. It is these substances, together with the lactic and uric acids, which, when decomposing or becoming rancid, give foul linen its sour, unpleasant odour. Bacteria and the germs of infection from enteric, cholera, diphtheria, phthisis, scarlet fever, &c., are destroyed; consequently the linen is effectually sterilised and sweetened without damage, as the liquor employed is one-tenth bleaching strength, and the time it is under action is at most twenty minutes, against two hours in the bleach croft.

Sterilising.—Linen known to be infected may be placed in the strong liquor for ten minutes, or for thirty minutes in liquor diluted six times; at this strength it may be employed to wash down the floors and walls of the wards or dormitories, sterilising and sweetening them. The odour which remains is reminiscent of the seaside.

The strong liquor may be used to flush closets, urinals, and drains; it is superior to chloride of lime solution, as it deposits no lime to choke the pipes in time.

It is used still weaker for sterilising suspected drinking water, or removing green weed in reservoirs, where it has

rendered good service: the addition of 3 per million (or 20 minims in 220 gallons) to the water to be treated is amply sufficient for this purpose, and prevents mildew on goods in process of dyeing and finishing.

Every person is aware of the relief secured from the bathing of an open wound in sea-water, which not only reduces inflammation, but is also an excellent means of cleaning it of pus and other matter which militates against healing. If the bandages of a fresh wound be immediately wetted with a weak chlorine solution rendered slightly saline with common salt, the wound will nearly always heal by first intention; it is sterilised, and germs cannot enter to set up inflammation, blood-poisoning, and septic troubles. A sufficiently dilute solution of chlorine will not injuriously affect the tissues of the body.

A weak solution of electrolytic sodium hypochlorite in swimming baths, by combining with and destroying the impurities cast from the bodies of the bathers, will prevent the very prevalent and unpleasant odour in these establishments.

The photograph herewith illustrates a hospital or sanitary type electrolyser as made by Messrs. Vincent, Roberts & Co., Leeds, heating and ventilating engineers. In its essential parts the outfit consists of: "Brine-mixing and supply vat; automatic supply tank, with valve, to give constant flow and prevent overheating (this supplies the electrolyser direct, which receives the current of electricity); the sodium hypochlorite flows from the opposite end of the electrolyser and is stored in a slate tank, to be drawn off for use. A switch-panel, fitted with voltmeter, ammeter, starting and reversing switch, safety fuse, and automatic magnetic cut-out switch for instantaneously cutting off the current should heating-up take place, completes the plant.

The electrolyser is also supplied with electric-contact thermometer, which rings an alarm bell should the temperature rise to 95° F., which may be caused by mixing the brine too strong, or allowing the brine vat to run empty, or forgetting to turn the brine cock on, or permitting the plant to get into a neglected state. If the alarm is ignored, in a few moments the magnetic contact, which shows a red light if everything is working well, comes into action: the red light is extinguished, the current is cut off, and the alarm bell sounded. This time the fault must be remedied, or the apparatus cannot be started again.

With such an equipment the most ignorant person cannot go wrong, so long as he is capable of mixing brine to a 4 per cent. density; all that is needed is to open the brine cock and switch on the electric current.

The electrolysed brine runs through the electrolyser at the rate of twelve gallons an hour, giving 120 gallons a day. It has one fixed strength, due to the two controls mentioned, and this is rather under bleaching strength and therefore harmless; any attempt to make it stronger would cause the plant to cease working. The current employed is 110 volts × 8 to 10 amperes, say 2 h.-p., or 1 unit an hour.

Coarse freezing salt is good enough for the brine; 4¾ lb. per hour run is the consumption.

For an institution employing five washing machines the electrolyser would need to run seven hours, and this would provide the additional liquor for badly stained clothes, for sterilising known infected linen, for washing walls and floors, and for flushing closets, urinals, drains, &c.

Cost of the liquor, about ten gallons for one penny. All other disinfectants are rendered unnecessary. Soda in the laundry may be discontinued, obviating the tendency of clothes to go yellow and linen to rot. There is a saving in soap also, especially in hard waters.

Where an institute generates its own electricity, as most of them do, the cost of the plant should be recouped in less than two years.

Space occupied, about 5 feet by 4 feet by 9 feet high; if the height cannot be conveniently given, the brine dissolver may be set up in a room above.

There are practically four separate controls on the correct working of the electrolyser:—

1. Hydrometer test of brine density.
2. Ammeter reading for correct current passing.
3. Electric-contact thermometer, which rings bell should current rise unduly.
4. Automatic magnetic control, which cuts off current and rings alarm bell if current rises unduly; when working, a red lamp is lit up: this is extinguished when current is cut off.

For checking the accurate working of the electrolyser and the strength of the solution when made, a simple chemical colour test is employed, but apart from this there are four visible checks, viz.:—

1. Hydrometer test for brine, which should read 4 per cent. density.
2. Temperature when working, which should be 90° F.
3. Voltage 110, amperes 8.
4. Flow of liquor, 1¾ pint per minute.

Any variation of one of these factors throws some or all the others out, and one or another of the alarms sooner or later comes into action.

The apparatus being so simple and autonomous, skilled labour is unnecessary; to commence work the brine cock is turned on, followed in a couple of minutes by switching on the current.

VARIETIES.

A REFUSE destructor is to be erected at the Corporation electricity works, Bridlington.

MR. JAMES EDWARD TAYLOR WAINWRIGHT, of Bidston, of the firm of Thomas Wainwright & Sons, architects and surveyors, Liverpool, left estate valued at £56,592, of which net personalty is sworn at £49,927.

MR. ARTHUR POLLARD has been appointed architect to the North-Eastern Railway Company in place of Mr. W. Bell, who retired at the end of December after fifty-seven years' service.

THE Glasgow Parish Council have approved in principle a proposal to provide accommodation for 300 additional patients at Gartloch Asylum. A definite scheme will now be prepared.

A LOCAL Government Board inspector has held an inquiry at Burton-on-Trent concerning the application of the Corporation to borrow £30,000 for a continuation of the duplicate rising main in connection with the sewage-disposal works.

AN extension to Messrs. Boardmans' at Stratford is being commenced by Messrs. E. A. Roome & Co., Urswick Road, Hackney, under the supervision of Messrs. George Baines & Son, architects. A feature of the contract is the very short time in which the work has to be executed.

THE Hull Corporation Bridges Committee have postponed for three months any further progress with the scheme for rebuilding the North Bridge. Any large expenditure of public money on a work of such magnitude was considered unwise in the present national crisis.

THE Scarborough Borough Engineer has reported to the Corporate Property Committee that damage to the extent of £200 has been caused to the Floral Hall (owned by the Corporation), and £90 to the Town Hall, by the bombardment of the town by the German cruisers.

MR. WILLIAM SMITH, a well-known Aberdeen architect and valuator, has died, at the age of seventy years. Mr. Smith had been in business in Aberdeen for about thirty years, and during that time was concerned with many important building developments.

AT a meeting of the Pontypridd Board of Guardians last week plans were submitted for proposed new buildings and additions to the children's home at Maesycoed. The cost of the work was estimated at £19,965. After a discussion the plans were referred back for further consideration.

THE Conway Board of Guardians have under consideration a scheme for the erection, at a cost of about £6,000, of cottage homes for the children at Llandudno Junction. The plans have been prepared by Mr. S. Colwyn Foulkes, Colwyn Bay, the architect whose designs were awarded the prize in a recent competition.

AT this week's meeting of the Cheshire Education Committee, at Crewe, the county architect's plans of the proposed dairy institute at Henhull Hall, Nantwich, were approved, and ordered to be forwarded to the Board of Agriculture. The plans include a dairy block, education block, and a hostel for thirty-two students, and the approximate estimate of cost is £25,668.

A COURSE of five public weekly lectures on "Belgian Art" will be given in the Architectural Lecture Theatre, University College, Gower Street, by M. Camille Poupeye, of Malines, Licencié en Art et Archeologie, at 5.30 P.M., on the Thursdays beginning the 21st inst. Admission is by free ticket, which is obtainable from the Secretary of University College.

CARDIFF Waterworks Committee have agreed that a circular letter be sent to the architects, builders, and contractors, stating that on and after March 1 next all water fittings and appliances must be submitted to the Corporation for testing, excepting those bearing the registered trade mark. This action is due, it is said, to the unsatisfactory character of the fittings used within the area of the Corporation, and the testing fees will vary from 1*d.* for taps to 4*d.* for cisterns.

THE partnership heretofore subsisting between Mr. J. W. Chessum and Mr. Roland B. Chessum, carrying on business as Messrs. J. Chessum & Sons, at 7 South Place, E.C., has been dissolved by mutual consent as on and from September 30, 1914. All debts due to and owing by the late firm will be received and paid by Mr. Roland Bruce Chessum. The business of the late firm will be transferred to a company to be called J. Chessum & Sons, Ltd., of which company Mr. Roland Bruce Chessum will be governing director

THE Secretary of the War Office announces that, owing to the very great number of offers of assistance and applications for employment received from civil and mechanical engineers, architects, and surveyors, it has been found impossible to acknowledge letters individually. Should an opportunity arise for utilising the services of any of the applicants, they will be communicated with, but the number of applications received far exceeds the probable requirements.

THE Northampton magistrates on Monday last granted an application made on behalf of Mr. A. Clarke, a builder, for an order upon the military authorities directing them to restore an apprentice who had enlisted. Mr. H. W. Williams said that his client was not unpatriotic, for 20 per cent. of his employees were serving with the Colours, and he was treating them liberally. The lad, however, had defied him, and Clarke wished to show him the first duty of a soldier was obedience to those in authority.

CAPT. E. G. PRETYMAN, M.P., has sent to the Press a copy of letter he received from Mr. Lloyd George regarding claims for increment value duty which have been served upon builders and other property owners where sales of property have shown a profit taxable under the Lumsden judgment. Property owners will be glad to learn from it that such claims will not be pressed pending the remedial legislation promised by the Prime Minister. Mr. Lloyd George says: "I am afraid the Government could not possibly see their way to suspend the assessment and collection of increment value duty generally; but they are prepared to instruct the Inland Revenue to hold in abeyance cases in which the relief claimed by the taxpayer is such as would have been granted under the legislation promised by the Prime Minister. Such cases could then be allowed to stand over until a date to be hereafter fixed. Special consideration will, of course, be shown in the case of persons liable to increment value duty who are serving with H.M. Forces."

MESSRS. SPRAGUE & Co., LTD., the lithographers, of 69 and 70 Dean Street, Soho, W., have the courage to make their highly useful Diary a real waistcoat-pocket affair. Yet it gives a space for each of the 365 days in the year, and includes much important technical information and tables, besides the usual postal guide, almanack, &c. The memorandum book, which has now reached its forty-sixth annual edition, has been carefully compiled for the benefit of architects and surveyors. Messrs. Sprague have, of course, for several years devoted their attention to the requirements of the architectural profession in such different matters as photography and lithography, office stationery, and "Ink-photo" process for reproduction of water-colour or pencil drawings, or photographs. As specialists of long experience, they are in a position to give marked satisfaction in all that they execute. Without undue egoism, we may hint that our own centre plates week by week demonstrate the firm's skill in at least one department. Perhaps of more personal importance to our readers is the fact that Messrs. Sprague have exceptional facilities for executing such lithographic work as in bills of quantities, specifications, plans, elevations, &c., and they undertake to supply copies at a few hours' notice for town delivery and by return of post for country.

FURTHER arrangements have been made by the committee of the Scottish Artists' Benevolent Association in organising the special fund for the relief of artists in distress owing to the War. A circular is being sent to a number of Scottish artists inviting them to contribute a good, representative example of their work in oil, water colour, or pastel, or in sculpture, to an exhibition which will be held in Glasgow during the month of March. The exhibited pictures and sculpture will be given to purchasers of five-guinea tickets, the number of which will correspond with the number of works, and each subscriber of five guineas will therefore be allocated one work, many of which will be of considerably greater value than the amount subscribed. In addition to the gift by Mr. D. Y. Cameron of one-half of the proceeds from the publication of an etching (limited to fifty copies at ten guineas each), another distinguished etcher, Mr. Muirhead Bone, has offered to publish a new etching for the benefit of this special fund. A donation of £100 from the London "Arts Fund" has been given to the Scottish Artists' Benevolent Association, and it is probable that a portion of the money at the disposal of the committee of the "Alexander Nasmyth Fund" will be utilised for the same object—to relieve distressed Scottish artists. Donations will be gladly received by Mr. Lawrence Scobie, 49 West George Street, Glasgow.

FORTHCOMING EVENTS.

Monday, January 25.

Architectural Association : Paper entitled "What Architects may learn from the Enemy," by Professor W. R. Lethaby, F.R.I.B.A., at 8 P.M.

London University College : Paper entitled "The Sculptures at Rheims Cathedral," by Mr. Arthur Gardner, at 5.15 P.M.

Surveyors' Institution : Papers entitled "The Report of the Land Inquiry Committee on Urban Land Tenure," by Mr. J. G. Head, F.S.I., and Mr. Joshua Bury, F.S.I., at 8 P.M.

Tuesday, January 26.

Institution of Civil Engineers : (1) Discussion on Paper "The Lateral Pressure and Resistance of Clay and the Supporting Power of Clay Foundations," by Mr. A. L. Bell; and (2) Paper entitled "Engineering Operations for the Prevention of Malaria," by Mr. F. Dudley Evans, A.M.I.C.E., at 8 P.M.

Royal Society of Antiquaries of Ireland : Annual general meeting, 6 St. Stephen's Green, Dublin, at 5 P.M., and evening meeting at 8.15 P.M.

Wednesday, January 27.

Royal Society of Arts : Paper entitled "Portrait Painting." by Hon. John Collier, R.O.I., at 8 P.M.

Carpenters' Hall : Paper entitled "Old Bridges," by Mr. Aymer Vallance, M.A., F.S.A., at 7.45.

EXPANSION OF BRITISH TRADE.

WE referred last week to a proposal to form a public company for the advancement of British manufactures in foreign trade, and we noted that the proposal emanated from a preliminary "Committee for the Expansion of British Trade" formed in Sheffield. It is characteristically English, when we want to do anything that requires funds, either to form a "society" which will appeal to charity or a "company" which may attract cupidity. The primary object of a company is to earn dividends, and, even when the object of the company is so far altruistic that the dividend is limited to a certain maximum percentage, the earning even of that limited dividend must be kept in view and influences the policy and action of the directors even in the operations of charity at five per cent.

In the pamphlet to which we referred last week by Mr. Reuss we find the statement that the editor of the *Financial Times* pointed out that, in his opinion, a great deal of time would be unnecessarily wasted unless a company formed to deal with the difficulties of many manufacturers, and want of knowledge on the part of others, had merged into it some good commercial organisation with established connections abroad, enfolding within itself a competent personnel accustomed to precisely the kind of work which would be required by the company.

We are also told by Mr. Reuss in the pamphlet: "I was approached, and agreed to accept the Managing Directorship, and to allow my business to be merged into that of any company formed, with a view to the extension of British trade, should this be desired and ratified by the Final Committee (an expansion of the "preliminary" Committee), thus permitting myself, on behalf of manufacturers, that wider field at present inaccessible to me for the practical application of the experience and knowledge of trade conditions overseas personally gained."

Thus it would appear that the basis of the proposed company would be Mr. Reuss and his business, which are to be expanded into a big concern with a capital of half-a-million sterling. Whether the present business of Mr. Reuss is a sufficiently good foundation for a company with a capital "of not less than £500,000" we are not in a position to say. The question may be left to the "Final Committee" to determine. "Undoubtedly," says Mr. Reuss, "the company would make very good returns to its shareholders; but the principal object of the company would be a patriotic one, and those manufacturers taking an interest in the company's work and availing themselves of its organisation would derive great benefit in increased business, in addition to the dividends upon any shares they may hold in the company."

The indubitability of the "very good returns" will, as in all companies, depend upon the management of the business. But we cannot forget that "John Company" founded our Indian Empire, and there is no primary reason why a company should not beneficially expand British trade. It might be supposed that the object of the proposed company should be to act as an intermediary between the manufacturer and the ultimate purchaser or consumer, either as a representative or a middleman. In either rôle there is room for such an intermediary.

It cannot be doubted that a partial cause of the inability of British manufacturers to hold their own against the enemy in overseas markets has been the ineffectiveness of their representatives. These consist, as we all know, of two classes—travellers and agents. The former proceed to foreign parts to introduce their employers' goods and secure orders; the latter, whether immigrant or native, reside overseas, and are presumed to have better opportunities of knowing the customers than a visitor. The system of travellers has not been successful because the supply of suitable men is extremely limited and the expense of the system is considerable, so that, except for large firms, it is out of the question. Nor does the system of agents meet the need of the small manufacturer in an entirely satisfactory fashion. There are too many professional agents who, in plain language, betray the trust that a manufacturer must of necessity place in them; men who make an income by collecting agreed payments for "expenses" from a number of firms in this country and obtain precious few orders for the firms they represent.

It might be presumed, therefore, that there is room for a "company" which should organise the selling department for foreign trade of British manufacturers and, by a staff of competent and reliable personnel, provide such an organisation of travellers and agents as, working for many firms, could give to each the advantages that any one could not obtain for itself. But we understand that the intention of Mr. Reuss is rather a company which should meet the conditions that now obtain in many cases of manufacturers who are dubious of the expense of putting down plant to enable them to meet the requirements of foreign trade, either in the fear that there might not be such continuity of business as would recoup them for the expense or from the fact that they do not possess the necessary capital.

These conditions are undoubtedly strong deterrents

Digitized by Google

in the attempt to capture enemy trade, and we understand that the intention of the company advocated by Mr. Reuss is to contract for and to stock the necessary quantity of goods to assure a manufacturer of a proper return for plant laid down, and also to finance any manufacturing member of the company, in part or whole, for the acquisition of necessary plant and machinery, provided that the manufacturer shall be a member of the company. It is further suggested that the company should be prepared to finance any engineering or other contract, under proper safeguards, in the interests of the country—and, we presume, of the company.

The company, therefore, would be middle-men, who would buy from the British manufacturer and sell to the purchaser overseas. Such an arrangement would probably be more eagerly welcomed by the manufacturer as it would save him the trouble, which experience shows he is loath to encounter, of making the study which is necessary for success in foreign markets of the languages, the weights and measures, the catalogues, the consignment work, the intricacies of freights, the consular invoice work, the insurance work, the financial work, the question of risk, &c. But the manufacturer's profits would have to be kept down in order to allow of the "very good returns" to the shareholders of the company.

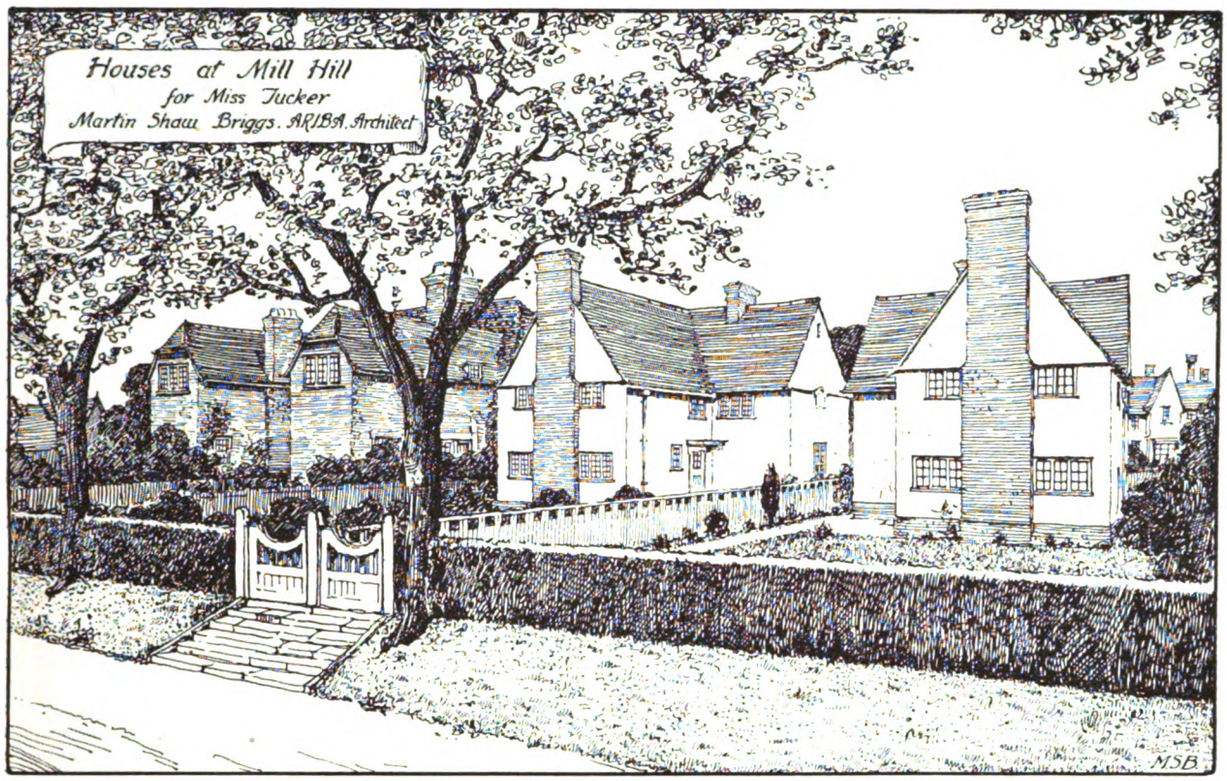
Mr. Reuss shows his appreciation of the many elements that influence the possibility of successful expansion of British trade not least by the proposition that his company should not be in any way dependent upon the present banking methods of this country, but should be in a position of independence in so far as overdraft and financial accommodation are concerned. We agree with him that the establishment of traders' or industrial banks would undoubtedly be a step in the right direction. We would go further and say that the provision of financial support for our manufacturers equal to that enjoyed by the German is an absolute necessity for the continued adequate expansion of British trade.

NOTES AND COMMENTS.

THE report on the work of the Waterways Association during the past year shows that the policy of the association met with gratifying support and made good progress in the first half of the year. Since the war broke out a check in its operations had taken place, but the need for the development of water transport had been emphasised.

Birmingham City Council had already in 1913 unanimously passed a resolution stating that when the Government gave effect to the report of the Royal Commission by appointing a Waterways Board and submitted to Parliament schemes for the improvement and development of the trunk canals connecting the Humber with the Severn and the Mersey with the Thames, they would favourably consider the principle of contribution. On January 29, 1914, a conference of Midland Municipal Authorities was held in Birmingham and addressed by the chairman (Mr. Neville Chamberlain), when the principle of local contribution was approved, followed by communications to authorities situated on the main trunk canals, resulting in the adoption of the following resolution by forty-two local authorities: "That this Council approves of the recommendations of the Royal Commission on Inland Waterways (1909) for the appointment of a Central Waterways Board to acquire and improve the principal canals of the country, but without acting as carriers thereon, recognises the equity of the principle that the local authorities of districts specially benefiting by any national scheme of development should directly contribute, and, should such Board proceed to improve and develop the canals serving this district, is prepared favourably to consider a proposal to bear a portion of the cost, and that the clerk be and is hereby instructed to forward a copy of this resolution to the Prime Minister, the members of Parliament for the district, and the secretary of the Waterways Association."

Nottingham City Council has gone still further in upholding the principle of support by local authorities to improved waterways intended to benefit their particular district, and has pledged itself to take over that portion of the Trent between the city and Newark with a view to the improvement of water transport with the Humber ports. The city will promote a Bill in the coming session of Parliament for power to acquire property, to find the necessary capital for improvement, £150,000, and control and manage the navigation. In August the Corporation had hoped for the assistance of the Development Commissioners, but with the country's commitments, due to the war, that authority, hesitating to expend public money on constructional works in the absence of unemployment, withdrew its support, resulting in Nottingham, subject to the approval of Parliament, boldly shouldering the whole burden of the improvements.



The design of these is such that the improved waterway will form a part of the scheme recommended by the Royal Commission, and may fairly be described as the first step to connect the Midlands with the sea. Boats of 100 or 120 tons will be able to load ex ship at Hull and other Humber ports, and discharge in Nottingham, without transhipment, into 30-ton barges, now necessary at Newark. From Nottingham, canals capable of development to the same standard connect with Leicester (33 miles) and, via Burton-on-Trent (29 miles), with Birmingham (63 miles) and Wolverhampton (78 miles).

The prospect of unemployment for many workers in consequence of the war resulted in a suggestion to the Board of Trade that employment upon works which would ultimately be a remunerative investment for the nation could be found in canal development. The President of the Board of Trade thereupon called for more detailed proposals, which were drawn up in consultation with the Chairman of the Waterways Association, and forwarded to him. The proposals suggested that the Government should announce that they were prepared to advance the sum of £2,000,000 for canal development, roughly divided into four sums of £500,000, to be applied to each of the four arms of "the Cross," conditional upon local authorities giving support of at least an equal amount, the Government to pave the way for the acquisition of existing properties by guaranteeing the owners a rent charge by valuation, based on the earnings of recent years. However, the call for immediate action in canal development to provide employment passed away, the labour returns fortunately showing that, instead of unemployment, there was in almost every district a demand which could scarcely be met.

In conclusion, the report stated that the year's work of the association had demonstrated that the country was ripe for the adoption of the recommendations of the Royal Commission on Canals, when the Government deemed it expedient to give a lead, and that it only needed that to translate the promises of local authorities to support a national system of inland waterway development into action backed by contribution. The present disastrous and scandalous congestion of traffic on the principal railway systems, with the consequent delay of material urgently required for war purposes, served strongly to emphasise the absolute necessity for some alternative method of transport.

The report of Sir Thomas Jackson, R.A., on the tower of Holy Trinity Church, Coventry, is sad reading, but the £6000 he estimates as the probable cost of repair ought to be readily forthcoming from the town itself, the enormous increase of whose industrial prosperity has no doubt contributed in some measure to the decay

Digitized by Google

These two small houses were erected by Messrs. WM. MOSS & SONS, LTD., from the designs of Mr. M. S. BRIGGS.

of the stone wall. The spire was blown down in 1665, and rebuilt within the next two years. Further repairs are reported nine times between 1674 and 1854, the latter repairs being described as 'thorough.'

In his recent examination the architect did not detect any failure in the arches, and the piers seemed upright. He concluded the foundation was good, and probably was laid on the solid sandstone rock which was near the surface. Some signs of crushing in the south-west pier under the nave arch were noticed; in the south transept there was a serious crack in the west wall, and a corresponding one in the east wall. These did not come to the ground, and were worst at the top, that in the west wall being nearly 2 in. wide in the upper part. The tower was of very slight construction, and the walls were so much cut up by windows that, except at the angles, they were very weak. They were of perishable sandstone, and somewhere about 1830 the whole seemed to have been refaced with new stone.

"The whole of the tower below the parapet," says Sir Thomas, "is in a terrible state of decay, though the refacing is not a century old. Many of the features of the design are nearly obliterated. Some parts are better than others, and in places the decayed masonry has been mended with new, but the whole surface, though comparatively modern, is in a state of absolute ruin. Mr. Chataway (the local architect) tells me he has already had to remove six tons weight of loose surface to prevent it falling on to the roofs. . . It will be understood from what I have said that the masonry is far past remedy by injecting any preservative solution. There is, I fear, no alternative but refacing the whole tower again as it was done before, but doing it in a better manner and in a better material.

The Sheffield electrical trades do not seem to have made a very good show in their opposition at the Local Government Board inquiry to the application by the Council for borrowing powers in regard to the building of new offices and shops in Bow Street. Of course this is but a flanking movement on the City Council's scheme of setting up as suppliers of electrical fittings. Possibly a frontal attack would be the better policy.

In a letter to the *Western Morning News* a "Ratepayer" writes:

"I notice in the agenda for Monday's Council meeting that the sub-committee appointed by the Visiting Committee make the following recommendation:

"'That it is desirable to extend the asylum to provide accommodation for 440 additional patients. That Messrs. Thornely and Rooke, architects, of Plymouth, be instructed to prepare designs for the extension of the asylum on the terms laid down by the Royal Society of Architects.'

"From the first recommendation it is evident this is to be a very large extension, costing, in all, probably £40,000 to £50,000, and will, no doubt, be built in blocks very similar to each other; and, as to the second recommendation, I consider that before the architects are instructed to prepare designs the Council should know as to the amount of commission that will be charged by them if they should be elected to carry out the work.

"As it is clearly laid down in the R.I.B.A. scale of professional charges, clause 4: 'When several distinct buildings, being repetitions of one design, are executed at the same time from a single specification and one set of drawings and under one contract, the usual commission is charged on the cost of one such building, and a modified arrangement made in respect of the others.'

"This being one of very few opportunities an architect has of quoting the value of his services, I would suggest that the above-mentioned recommendation should receive further consideration before the Council is asked to approve, in order to ascertain what the 'modified charges' under the circumstances would be for the architect and the quantity surveyor. There are several architects in the borough who would acquit themselves with credit, and should be given a chance of obtaining a good-sized job."

"An Architect Ratepayer" follows this up with the reply:

"Whilst agreeing with the letter of 'Ratepayer,' might I suggest that the time is now come when all qualified architect ratepayers should be put on a

Digitized by Google

'roster' by the Council, and the work undertaken be fairly spread amongst the architects of Greater Plymouth. This would save much heart-burning on the part of the architects, and also obviate the invidious position of many members of the Council owing to the importunities of their professional friends."

The two letters form an interesting illustration of professional life in a provincial town which scarcely, we think, requires comment.

COMPETITION NEWS.

BURNLEY.—The Board of Management of the Burnley Victoria Hospital have received the award of Mr. H. Percy Adams, F.R.I.B.A., of London, the assessor appointed to adjudicate upon the plans submitted by the ten selected architects in competition for the proposed hospital extension. The names of the authors of the four premiated plans, in order of merit, were as follows: (1) Mr. William A. Pite, London; (2) Messrs. Hitchon and Pickup, Burnley (premium of £75); (3) Messrs. Taylor and Simister, Oldham (premium of £50); (4) Mr. T. H. Vowles, Burnley (premium of £25). The names of the other competing architects were (in alphabetical order): Messrs. John Brooke and Elcock, Manchester; Mr. Hugh Healey, Manchester; Mr. William A. Quarmby, Burnley; Mr. Thomas A. Pole, London; Mr. A. Saxon Snell, London; Mr. Arthur W. Worrall, Wolverhampton. The proposed extension will hold about fifty beds, and a new operating theatre and a new nurses' home will be provided.

DONCASTER.—At the last meeting of the Town Council a recommendation was considered from the Council in Committee: "That the Corporation prepare a new sewage scheme for the extended borough on competitive terms and ask the advice of the Institution of Civil Engineers as to the conditions consistent with their Institution." It was urged that the borough surveyor was overworked, and that an expert ought to be engaged to do the work. A motion to reject the recommendation was defeated, but a further resolution to refer the matter back to committee was carried.

MACCLESFIELD.—At the meeting of the Lands, Railway, and Town Development Committee a letter was read from the Hon. Secretary of the Manchester Society of Architects protesting against the competition for obtaining plans, &c., of workmen's dwellings, and suggesting the engagement of an architect to prepare the scheme; also that an assessor should be a well qualified architect in independent practice. After consideration it was decided that the Town Clerk reply, stating that the competitive scheme is a purely local one, and that it rests with the local architects to send in plans themselves or not, and, further, that the architects can make arrangements with the builders of the town, so that they can do the work. It was further resolved that the borough surveyor reply to a letter from the Royal Institute of British Architects that the proposed competitive scheme for plans, &c., for workmen's dwellings is purely a local one.

Members of the Society of Architects are requested not to take part in this competition without first ascertaining that the conditions have been approved by the Society, which is in negotiation with the promoters with a view to securing certain amendments.

NEWCASTLE.—The competition for the extension of Rutherford College for Girls has been decided in favour of the plans submitted by Messrs. Marshall and Tweedy, architects, 17 Eldon Square, Newcastle. The competition was limited to six local firms experienced in school designing. Part of the scheme includes the erection of a new assembly hall to accommodate 1,000 persons.

WHITAKER'S ALMANACK for 1915 is no less amazing than any of its predecessors, for a compilation of this sort must always arouse a feeling not unlike awe. The text of the forty-seventh edition occupies nearly 900 pages, and comprises the concentrated essence of several volumes. It is significant that last year's article on "The World's Peace" is replaced by one on "The Great War." In many other ways the information is brought as abreast of the moment as the exigencies of printing and publishing allow. All the familiar and invaluable features of the Almanack are retained. We were surprised to learn that the mural paintings in the Central Criminal Court were by Sir W. B. Richmond and "General" Moira—surely the latter professor has enjoyed phenomenally rapid promotion.

ILLUSTRATIONS.

HOUSE AT BUDLEIGH SALTERTON.

THIS drawing shows the south front and a bird's-eye view of a house and garden for Mrs. Ferrier at Budleigh Salterton, Devon. Owing to the steep slope of the site, it has been necessary to lay out the garden in terraces. The materials of the house are red and various toned bricks up to the first floor, with rough-cast above. The builder was Mr. J. C. Palmer, of Budleigh Salterton, and the architects Messrs. Rogers, Bone & Coles.

DODBROOKE CHURCH, DEVON.—DESIGN FOR A NEW REREDOS.

THIS design shows an adaptation of existing triptych to a carved oak frame and base forming a reredos in the Lady chapel at Dodbrooke Church, Devon. The carving was carried out by Mr. A. Robinson, of 54 Broad Street, Bloomsbury, and the architects are Messrs. Rogers, Bone & Coles.

OFFICES OF THE AGENT GENERAL OF WESTERN AUSTRALIA, SAVOY HOUSE, STRAND, W.C.

IN view of its historical associations and position, "Savoy House" has become a landmark to Londoners, a circumstance due possibly to its name rather than to any architectural merits which it may possess.

Situated midway in the Strand, at the junction of Savoy Street and that busy thoroughfare, it is recognised as an ideal position for the offices of the representative of such a progressive State as Western Australia, which has so many and varied resources to bring before the people of the world's metropolis. The programme of rendering the building distinctive was not an altogether easy one.

The street front to the Strand and Savoy Street, from the pavement up to and including the main cornice at the first floor level, has been pulled down and rebuilt in pure black Belgian marble without relief whatsoever, save that which comes naturally from the highly polished surfaces, the white lettering of the fascias, and the large white marble panel over the main entrance inlaid with the black swan of Western Australia, which gives the key note of the whole scheme.

The design has been kept severely simple in character and the full richness of the marble thus accentuated. By an arrangement of lighting the swan panel is brilliantly illuminated at night.

The whole of the building above the black marble base has been painted white, the effect of which has pulled together and dignified the former ineffectual architectural detail.

Through swing doors one steps into a fine entrance hall running the depth of the building, some 66 feet. The old entrance hall and staircase from Savoy Street, which formerly divided the building into two, have been swept away, and a re-arrangement of the old floor levels has given the interior a new aspect.

The hall is divided by a glazed screen and counter, approached by wide circular steps, on the right of which is the passenger lift and telephone exchange.

The walls, at present painted, are ultimately to be panelled with fine Western Australian jarrah to a height of 9 feet. The panels to the front of the counter afford an example of the beauty of this timber, the use of which in England is likely to become extensive when it is better known. At present it is generally considered that both jarrah and karri are eminently suitable for wood-block road paving and dismissed at that, but this is a view soon altered when the full possibilities of utilising these magnificent timbers are realised.

From the entrance hall, in which the emigration offices are mainly situated, a new oval staircase leads up to the first floor and down to the lower ground floor; while the well-lighted windows, both in the Strand and Savoy Street frontages, afford ample room for the display of the numerous Western Australian products.

At this level there is a second entrance, from Church Row, with a staircase leading to the basement, which comprises lavatories, heating chamber, motor room, and stores.

The main feature of the alterations throughout is the elimination of many of the old division walls, giving large airy offices in place of small rooms.

On the second floor, overlooking Savoy Chapel and the river, are the administrative offices of the Agent-General and the Secretary. Here, again, the note of black is found.

Digitized by Google

The two fireplaces are built of black Belgian slabs and white statuary marble, the heavy projecting shelves being supported by two bronze lions, the masks being modelled by Mr. Albert Hodge. This floor, as well as that in the entrance hall below, is laid with secret-nailed Western Australian jarrah boards 3 inches wide, unstained, and wax polished. The woodwork throughout the room is painted black, powdered with gold and polished, and the cornice to the vellum white ceiling is again black, relieved with gold lines and stencilling.

The remaining offices are treated in one scheme of colour of a pleasant cool green with cream walls, while, thanks to sound craftsmanship, there is throughout the building an atmosphere of convenience and comfort, without unnecessary embellishment.

The architects were Mr. John W. Simpson, F.R.I.B.A., and Mr. Maxwell Ayrton, A.R.I.B.A., and the general contractors were Messrs. W. E. Blake & Sons, Ltd., London.

ORIEL WINDOW, HAMPTON COURT.
ST. BRIDE'S CHURCH, FLEET STREET.

THE drawings we reproduce of these buildings were made by Mr. Chas. S. Carter during his tour as holder of "The Architect" Travelling Studentship for 1914.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

AN ordinary general meeting of the Royal Institute was held at their premises on Monday, the 18th inst., Mr. A. W. S. Cross, M.A., Vice-President, in the chair.

The death was announced of Mr. John Henry Cossar, Licentiate.

Mr. F. C. Eden, M.A. (Oxon.), then read a paper entitled

"VARALLO AND ITS IMITATIONS."

The district to the south of Monte Rosa and the Simplon, while not remarkable for the excellence of its ecclesiastical architecture, is rich in the interesting class of buildings known as sanctuaries.

They are of every degree of architectural importance, ranging upwards from the tiny mountain shrine, rudely built and poorly furnished, at the bottom of the scale, through the modest church provided, maybe, with lodgings for a chaplain or a suite of rooms for the accommodation and refreshment of pilgrims, to the vast proportions of such an institution as Oropa, dominated by its enormous hospice. Others consist of scattered chapels grouped round a monastery, or strung out along the way to a pilgrimage church, famed for the possession of a miraculous image or other venerated object. Each has its special *festa*, usually in August or September, attended by larger or smaller throngs of country folk, according as the celebrity of the sanctuary is confined to its own valley or is something more than merely local. They are to be found in the most varied situations, on the very mountain top, on the verdant slopes of the foothills, and by the high road that skirts the valley.

But the most complex and interesting type of sanctuary is undoubtedly the Sacro Monte. This consists of a series of chapel-like buildings designed to protect and exhibit groups of life-sized statuary, provided with porticoes or other shelter for spectators, and so arranged as to be approached in a definite order. Of these Varallo is the most famous, both as being the first thing of its kind, and for the great artists who participated in its production.

In the year 1481 Bernardino Caimi, member of a noble Milanese family, minor observant of the Order of St. Francis, on returning from Palestine, conceived the project of founding a sanctuary, a new Jerusalem, which should represent with some verisimilitude the sacred sites yet fresh in his mind.

Great ideas are seldom original in their essence; usually they are based on something that has gone before. The originality of genius merely precipitates what was already in solution. This was the case with the new idea of the Sacro Monte.

The Sacro Monte must be understood as a development of the centuries-old practice of making memorials of pilgrimages to the holy places in Jerusalem. The chapels are so many "stations," though not all, nor indeed any of them, necessarily connected with the Way of the Cross. At Varallo the whole of the Redemption Story is displayed in more than forty groups of figures; at Orta the life of St. Francis is the theme; at Varese and Crea the XV. Mysteries of the Rosary; at Oropa the life of Our Lady; while Graglia, the grandest scheme of all, which, however, never came to completion and is now ruinous, was to have included no less than a hundred scenes from the life of our Lord.

As in its origin, so in its evolution, the devotion was typically Franciscan, and the three best-known sanctuaries of this class all grew up under the fostering care of that famous Order.

About the year 1486, after examining many sites, Caimi came to the conclusion that the hill overhanging Varallo, and known for its steepness as "sopra la parete," was the most convenient for his purpose. The townsfolk falling in readily with the project, he obtained cession of the ground and also of the site for a convent at the foot of the hill. Some sort of establishment in Varallo itself was essential; a place for work, study, collection of materials, and direction of the workmen. So the convent and church of St. Maria delle Grazie at the foot of the hill came into being. The steep, narrow path by which the hill-top had been approached was succeeded by a commodious road for the transport of materials, and finally, in the year 1491, took place the inauguration of the Chapel of the Holy Sepulchre, the *clou* of the whole scheme.

Caimi was a man of extraordinary energy. Though constantly travelling on the business of his Order, he managed to find time between his tenure of various offices to visit Varallo for the purpose of organising, directing, and hastening the completion of the work. And to such good purpose that at the end of his life (1499) he left not only a sufficient number of executed groups to make his conception clear, but a fund of potential energy to carry it to completion.

To the south and west the ground falls away precipitously towards the town; less so to the east, while towards the north it rises, at first gradually, then more steeply, to a forest-clad hill, from whence you may get a good bird's-eye view of the whole Santuario.

In spite of their variety the planning of these chapels is of the simplest. Three systems have been followed.

The very earliest was a simple rectangular chamber without any sort of barrier or division, so that the spectators actually passed through the show-space. There were obvious inconveniences to this arrangement, witness the sixteenth-century names and dates still to be seen scribbled on the frescoed walls of the Crucifixion Chapel, and so the place for the spectators came to be railed off. The partition was effected by a screen or grille of carved wood, so designed as to allow an easy view of the ceiling and wall paintings as well as the figures. Most of these screens are highly ornate and varied in design. In the latest examples the whole of the interior space is given up to the sculptures, and an external portico is added for the accommodation of the pilgrims. Both methods, the screen and the portico, are used at Orta, at Varese the latter only.

The walls are of plastered rubble with granite dressings, and the roofs are covered with the heavy stone slabs which give such dignity and character to all the roofs in these upland valleys.

It is the piazza with its two-storeyed cloister and circumjacent chapels that must be deemed the climax of the whole composition, not the big church which strikes the only jarring note with its aggressive modern façade.

At Varallo the chief artistic interest centres in the contents of the chapels, at Orta and Varese in the buildings themselves. These are designed to contain groups of painted imagery, which combine with their frescoed backgrounds to form tableaux of Sacred History, emphasised with all the realism of a scene on the stage. It is hard to resist the conclusion that the designers of these tableaux had in mind the scenes in the "Sacre Rappresentazioni," or Mystery Plays, with which they would be familiar. The chapels are, in fact, small theatres, and their form must have been suggested by the little erections called "mansiones" used in the Mysteries, and labelled "Palatium," "Templum," and so forth, from one to another of which the actors moved for the different scenes of the drama.

The arrangement of the groups themselves follows in many points the accepted conventions of the contemporary religious theatre; compare, for instance, the introduction in the Annunciation scene of a *prie-dieu*, one of the recognised "properties" in representation of that subject; in the Flagellation, the man in the foreground stooping down and tying a bundle of rods; the crowd of what are really stage "supers" following in the Way to Calvary; the arrangement of the personages in the Last Supper; five one

Digitized by Google

side of the table, three at each end, and two, one of them being Judas, on the remaining side.

The earliest figures, those which came from the Franciscan workshop, were of wood. But early in the sixteenth century Guadenzio Ferrari, at that time quite a young man, was summoned to fresco the convent church, where he painted what Symonds calls "a whole epic of the Passion"; and a few years later we find him at work in the chapels of the Sacro Monte. It was he who introduced the use of terra-cotta in place of timber for the figure groups; and in 1523 he is engaged upon the groups and frescoes of the Crucifixion Chapel, being then at the height of his powers. Several other artists of note were employed, the most eminent of whom was Jean Wespin, a native of Dinant, in Belgium (1560-1615), known, according to the Italian practice, by the nickname Tabacchetti.

The architcetural merits of these buildings, considered in the abstract, so to say, or as they would appear when reduced to line and scale, are not, perhaps, particularly noteworthy. On the whole it is certainly not so, though Orta and Varese may supply instances to the contrary. It is simply as they are, where they are, and as what they stand for that they make their appeal. All these sub-alpine valleys still possess the charm of romance; and when the works of man enhance instead of detracting from that rare and vanishing quality they have done all we need ask of them.

The Sacro Monte of Orta occupies a wooded promontory overhanging the town and lake of that name.

The same materials are employed here as at Varallo—viz., granite and plaster; but with the addition of a rusty green serpentine, which takes and retains the finest detail, and is used for the smaller moulded members. The lay-out is less confused than at Varallo, and the chapels seem to have been placed so as to get the best effect from each separate building, rather than with an eye to picturesqueness of grouping. By this time any such attempt would have been rendered nugatory by the denseness of the trees.

The first stone was laid in 1591, and between that date and 1630 all the best chapels were built. The evidence of the building accounts still preserved in the archives of the monastery points to a certain Padre Cleto of Novara as their author. It is significant that the style is old-fashioned—in fact, about a century behind the times—suggesting the inference that the designer was an amateur of Classic architecture, uninfluenced by current movements and fashions in art.

The highest point of the Sacro Monte is occupied, as at Varallo, by the circular Chapel of the Stigmata. The plan is noteworthy not only for its simplicity and inevitableness, but as the earliest example among these chapels of a circular temple surrounded by a portico, and as the model for much subsequent design both here and at Varese. But it has further claim upon attention. Once this type of plan had been brought to the notice of the artists of the Renaissance by the study of Classical antiquity, it seemed to inspire many of their dreams. The pictorial value of the grouping of columns and arches, the ever-changing lights upon curved colonnades gleaming against their shadowy background, made an irresistible appeal. The difficulty was to find an excuse for such a building, some real use to which it could be put. For ordinary church-building purposes a plan of this kind had been out of fashion for centuries, and was now considered impractical.

But once again on this wooded hill by the lake of Orta came the opportunity. For sheltering and displaying groups of statuary the circular plan was as serviceable as any other, and, since the pilgrims had to stand outside, the external ambulatory was justified. The longed-for ideal could at last be adapted to practical needs, and with the opportunity came the man. Our wonder is that it should have been left for an obscure friar, whose name is unknown to fame, whose resources were limited, who was born out of time, to give us one of the purest, most refined, and most original buildings which the Italian Renaissance ever produced.

The buildings of which the earlier sanctuaries consist seem to be strung together upon their connecting paths like a chaplet of beads allowed to fall into accidental folds and kinks. At Varese the thread is stretched to its full length, and the chapels follow one another in orderly progression by the side of a high road. But what a road! Imagine a broad-paved pilgrim's way about two miles in length, ascending in zigzags along a wooded ridge till it reaches a mediæval town perched on the summit of the "Arête." At every turn of the road stands a chapel, so placed as to show to the best advantage from below and to afford from the loggias provided by the thoughtful designer the best viewpoints for the enjoyment of the landskip.

Here, for the third time, the scheme of a Sacro Monte originated with the Franciscan order, the moving spirit being a Capuchin friar, Giovanni Battista Agguggiari. The task of raising funds was attended with no little success. The cost of the finely engineered road, the construction of which seems to have proceeded contemporaneously with that of the chapels, must have been enormous. The chapels themselves are on a more ambitious scale than had been attempted before, and stand on lofty substructures which jut, like bastions, from the retaining walls of the road.

The subjects illustrated are the Fifteen Mysteries of the Rosary, divided into the usual triad, Joyful, Sorrowful, and Glorious. The commencement of each group is marked by a triumphal arch and a fountain, while the church at the top containing the venerated image is, of course, the *raison d'être* and climax of the whole.

The design was entrusted to a local architect, Bernascone of Varese. With the possible exception of five late and unimportant chapels, all are his work, and show their author to have been a man of no little imaginative and inventive power. Though begun only ten years after Orta, about the year 1606, they are quite a century later in feeling. One is at once struck by the difference in the colour of the buildings; the stone roofs and whitewashed walls of the mountain valleys have been exchanged for the red tiles and yellowish stucco of the plain. Granite is more sparingly employed, while the increased use of stucco imparts a sort of coarseness that smacks of a declining art.

An important new departure was inaugurated by Bernascone. At Varallo and Orta the figure groups can only be seen from one point of view. Now for the first time additional openings are provided at the sides. The architecture generally suffers from the indifference and worse of the carving. Bernascone seems to have recognised the impossibility of securing tolerable sculpture, and wisely limited himself to a minimum, a truss here, a festoon there, and sometimes a cherub's head in a tympanum; but these latter are often inconceivably gross and spiritless.

The ironwork generally is poor. The grilles in the view openings are loose and invertebrate where they are not mere grids of upright bars; their dulness somewhat relieved by the exquisite patina of the bronze reels and spindles through which they are threaded.

DISCUSSION.

Mr. Paul Waterhouse, in proposing a vote of thanks, said he thought the only reason why he should have been honoured with that task was that he had been born in Manchester, which was perhaps the place least like Varallo. It was difficult to add anything in the way of a speech to the paper just read. More than thirty years ago he paid his first visit to Orta. Mr. Eden's paper had been most illuminating and most charming. He had read them much more than a mere architectural paper, for the buildings could not be described properly, so full of sentiment were they, by anyone who did not understand them. Mr. Eden has given more architectural study to these mountains, perhaps, than anyone else. There seemed to be something particularly touching about the alliance of the Franciscan Order with such graceful examples of Renaissance building. It was touching that a poor Order should be allied to such luxuries. The whole spirit of the Order seems to breathe in these delicate pieces of work, though at first sight they may seem contrary to it. Every student of the Renaissance who views the period aright realises, not merely that common gratitude for opportunities received made the architect the servant of the Church, but that the entire spirit of the Renaissance was intimately consecrated to religion. Nowhere is that better seen than in the mountains of northern Italy. Though some of the buildings are so simple, barely more than cottages, yet they are full of intricate architectural thought. A present-day architect engaged to design a circular building could not do better than go to one of the sanctuaries. On his last visit to Orta he had been particularly struck by the well-house for the way in which it got over certain technical difficulties. Mr. Eden had alluded to the Church of St. Maria delle Grazie at the foot of the hill overhanging Varallo. He (the speaker) believed there was only one other church where the same arrangement exists for the display of a large painting; here the east end seems practically all closed by a wall which serves the purpose of a chancel screen, while the only sounds of the Mass come from the low arches at the base. The trees at Orta may possibly have overgrown the artist's original intention, but

Digitized by Google

nothing can exceed the charm of the many temples hidden by the thick growth. In conclusion, he would like to say that the pictures shown on the screen had been most excellent and that they thanked Mr. Eden for leading the audience into the very spirit of the men who erected those buildings.

Mr. E. P. Warren remarked that, having followed and read the paper with the greatest possible interest he would begin by seconding the vote of thanks for a most charming paper. What had struck him very much when visiting Orta was the confusion of the plan caused by the growth of the trees and the magnolias which gave an extraordinary charm to these semi-circular looking buildings. The coarse-grained dark granite used there produced an effect like what may be seen in Brittany. They struck him as being a direct evolution from the necessities of the material. At Varallo the effect is less concentrated because there is more of it. These immense groups of terra-cotta of extraordinary excellence are commingled with the wall paintings and produce an effect unlike anything he had seen elsewhere. The whole thing was intensely theatrical, though that was not a term of opprobrium. The appeal still remains forceful and the groups serve their end with the people for whom they were intended. To the tourist they produce an appeal which is very singular and very definite. He thought that a painter or a sculptor would get very valuable lessons in composition from them. There was also abundant opportunity for the study of circular, elliptical, and variously shaped buildings and of their lay-out as caused by the ground. One thing which ought to be borne in mind when considering such groups of buildings as shrines or sanctuaries was that, although they served as an excitation to devotion, they also meant an enormous access of wealth to the town in which they were placed. There was always a natural tendency to make the most of such a possession and to rival the shrines or sanctuaries of other towns. Unless that element were taken into consideration it was impossible to arrive at a just appreciation of the effects one finds.

Mr. Walter Tapper alluded to the tremendous amount of interesting detail which is to be found in these sanctuaries; the ironwork, for example, is very well designed. At Orta the colonnades are striking from the use of differently coloured pebbles. Indeed, the first thing which struck him when he saw the place was its delightful colour. The diversity of plan was most remarkable. The first chapel one sees seems to have the only possible plan; but the next one may be even more interesting.

Mr. Curtis Green considered Mr. Eden was one of the most interesting minds in the profession at the present time, so he always listened to what he had to say. In this part of Italy the whole countryside is rich in mountain sanctuaries. It was noteworthy that here were an ignorant primitive people doing work in a perfectly natural way, and that art was the result. He felt sure that if the people of that date could do such pleasant work with such simple materials it was possible for architects at the present time to do pleasant work with the means at their disposal.

A vote of thanks was then passed by acclamation.

Mr. F. C. Eden, in acknowledging the vote of thanks, said there were three kinds of figures—namely, the timber, the terra-cotta, and the stucco. Some of the figures in the groups had been in course of time altered, terra-cotta placed with wood and so on. Certain of the figures had been draped in linen and then the surface decorated with gesso. A figure of Eve had been transformed into a Roman soldier. In many cases flax was stuck on as hair. Such accessories as canopies, tastas ,&c., were real.

The next meeting will be on Monday, February 1, when the Council's nomination for the Royal Gold Medal will be received and a consideration will take place of the revised schedule of charges.

THE DAMAGED COLUMN OF MARCUS AURELIUS ANTONINUS, ROME.

By J. TAVENOR PERRY.

THE appalling earthquake which has just visited central Italy has for the moment withdrawn the attention of architects from the ravages of the northern barbarians elsewhere, but the details we have so far received are too vague and insufficient to enable us yet to measure the extent of the damage done to the public buildings. From the accounts, however, published in the *Times* and other journals we can judge that, so far as Rome itself is concerned, except perhaps, in some shaking which the upper part of the dome of St. Peter's, not at present defined, has sustained, the damage to the ancient or historical structures of the city is mainly superficial, the most important exception being the celebrated Antonine Column standing in the centre of the Piazza Colonna. This, however, is alarming enough if we accept as correct the first *Times'* report sent to that paper from Rome on the same day that the accident happened. It runs thus: "The column of Marcus Aurelius in the Piazza Colonna was broken in various places, and the beautiful bas-reliefs have been irreparably damaged. Possibly the column will have to be pulled down." A further account states that the shaft, about half way up, appears to be twisted about six inches out of the straight, and that the damage to the bas-reliefs occurs principally in those which "represent the conquest of the Marcomanni."

A brief account of the state of this column at the end of the sixteenth century, and the works carried out for its reparation by Domenico Fontana, will be to some extent reassuring, and will tend to show that it is not in so dangerous a condition as is supposed; while a general

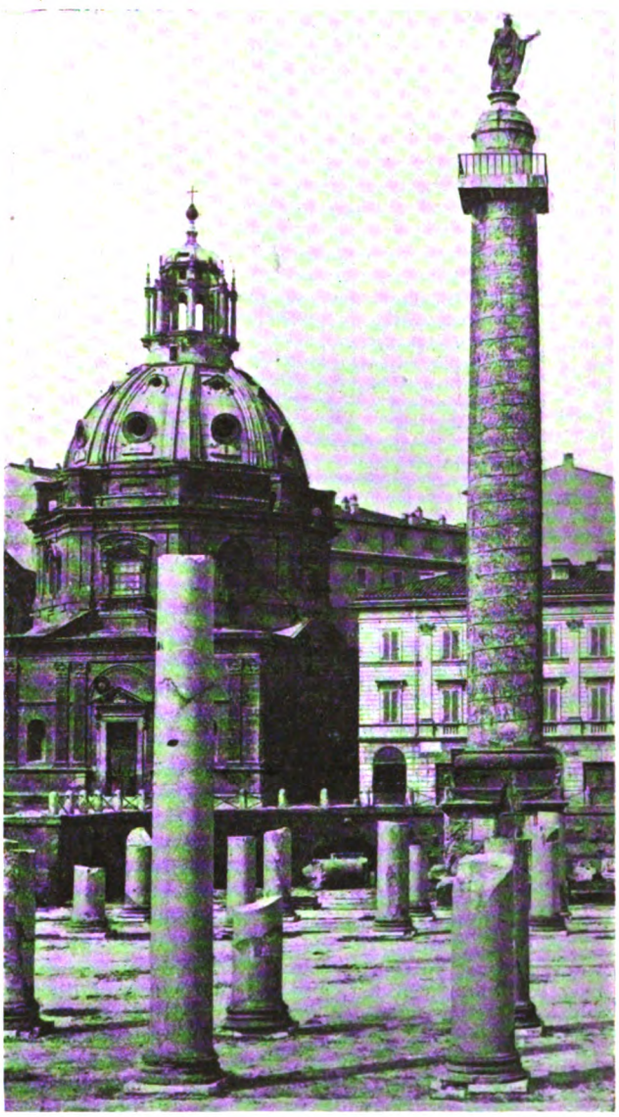


FIG. 1.—TRAJAN'S COLUMN.

description of the other ancient monumental columns still standing in Rome cannot fail to be of interest to all architects at the present juncture.

There are now five such columns in various parts of the city, of which three occupy the positions on which they were first set up. These are Trajan's column in the Foro Traiano, the Antonine in the Piazza Colonna, and the column of Phocas—"the nameless column with a buried base"—in the Roman Forum; and, besides these, the pedestal of the column of Antoninus Pius, removed from its original position on Monte Citorio, is preserved in the Vatican. The two other ancient columns are the one set up before the entrance of Sta. Maria Maggiore on the Esquiline and the other in the Piazza di Spagna, both taken from ancient buildings by the Popes and now carrying statues of the Blessed Virgin.

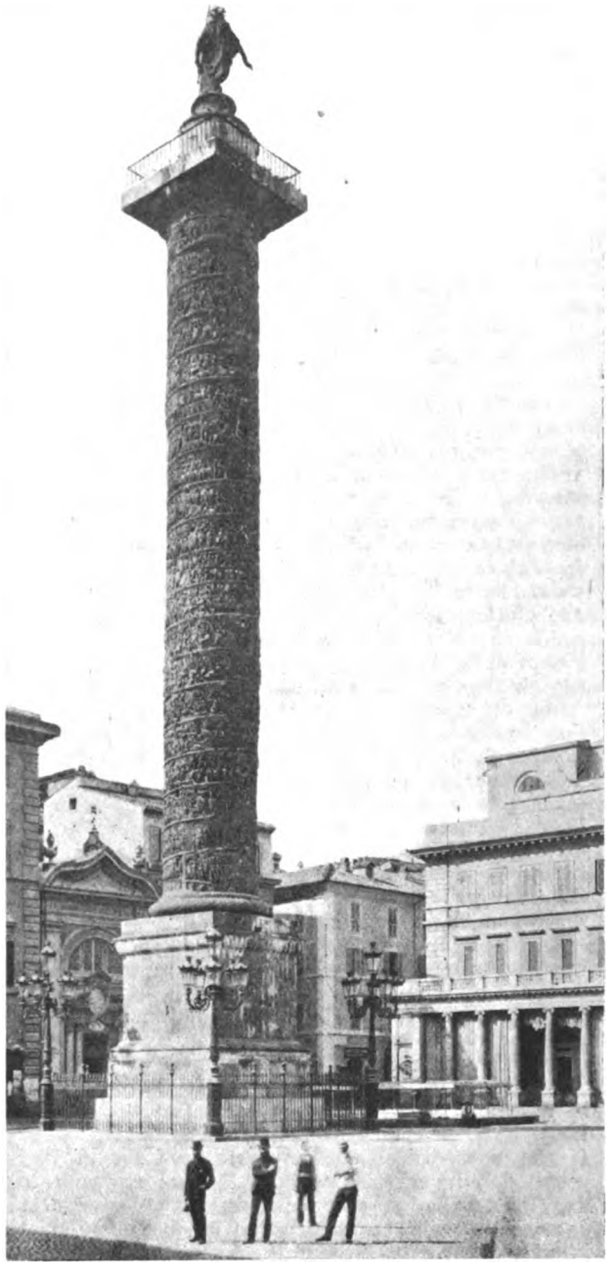

FIG. 3.—COLUMN OF MARCUS AURELIUS, NORTH-EAST SIDE, AS RESTORED BY FONTANA, 1588.

The columns of Trajan and Marcus Aurelius occupy a pre-eminent position in the minds of all visitors to Rome, whatever their particular taste or however uninterested they may be in works of art, and they form two of the sights which every "personally conducted" tourist is taken to see. They excited the greatest interest throughout the Middle Ages, and were spared by the Vandals in the fifth century and by the Germans in the fifteenth during the *Sacco di Roma*. The solicitude of the Romans for the preservation of these monuments of antiquity is shown by the decree of the Senate in 1162, in particular in reference to the column of Trajan, which runs: "In order that it shall never be mutilated or destroyed, but shall remain as it stands to the honour of the Roman people, as long as the world endures. Anyone daring to injure it shall be punished by death and his property shall fall to the treasury." And an inscription, in the atrium of S. Silvestro in Capite, in the care of whose convent the column of Marcus Aurelius was placed, says in forcible language: "Anyone taking the column by force from our convent shall be eternally damned as a spoiler of the Temple, and shall be encompassed by the everlasting anathema. So be it. Peter by God's grace humble Abbot of this convent, with his brethren drew up and ratified this in the year of the Lord 1119, in the XII. indiction." In refreence to Trajan's column it may be noted that it was in use as a bell-tower when Charles V. visited Rome.

Trajan's was the first of these columns to be erected in Rome, the architect being Apollodorus, who placed it in a courtyard about 40 feet square surrounded by lofty buildings from which the sculptures could be carefully studied, and only the statue at the top could be seen over the roofs in the city (fig. 1). It stood, without the statue, 128 feet high, and was constructed of thirty-four blocks of Carrara marble, of which eight form the pedestal, one the base, twenty-three the shaft, one the capital, and one the base of the statue. The spiral band of high reliefs, representing the Dacic wars, contains 2,500 figures, all carved after the shaft was set up, and these were discovered by Professor Semper to have been originally brilliantly coloured and gilt. He says in his well-known essay on Polychromy in Architecture, "the Trajan column, which I have examined, retains traces of colour and gilding; the entire column had been once covered with a thick coating of colour, in which I recognised green, blue, and yellow; but it is probable that this last was the remains of the gilding." The top of the column was reached by 185 steps of a spiral staircase, which were only roughly hewn out of the block before fixing and finished in position; and at the top, near the doorway of exit, are scribbled, in quite modern fashion, the names of many who had climbed so high, the earliest dating from the year 663.

The Column of Marcus Aurelius Antoninus was erected in 174, or sixty years after that of Trajan, of which it is a distinct imitation. It commemorates the Emperor's victories over the Quadi and Marcomanni, Teutonic barbarians of his period; and the events in his campaigns against them are shown in the sculpture which winds round

Digitized by Google

the column in a spiral band in higher relief than the work on the earlier column, and which was probably coloured in the same manner; and it seems almost certain that it stood in a small courtyard, from the surrounding buildings of which the details could be viewed. It was known as the Columna Centenaria because the shaft, base and capital

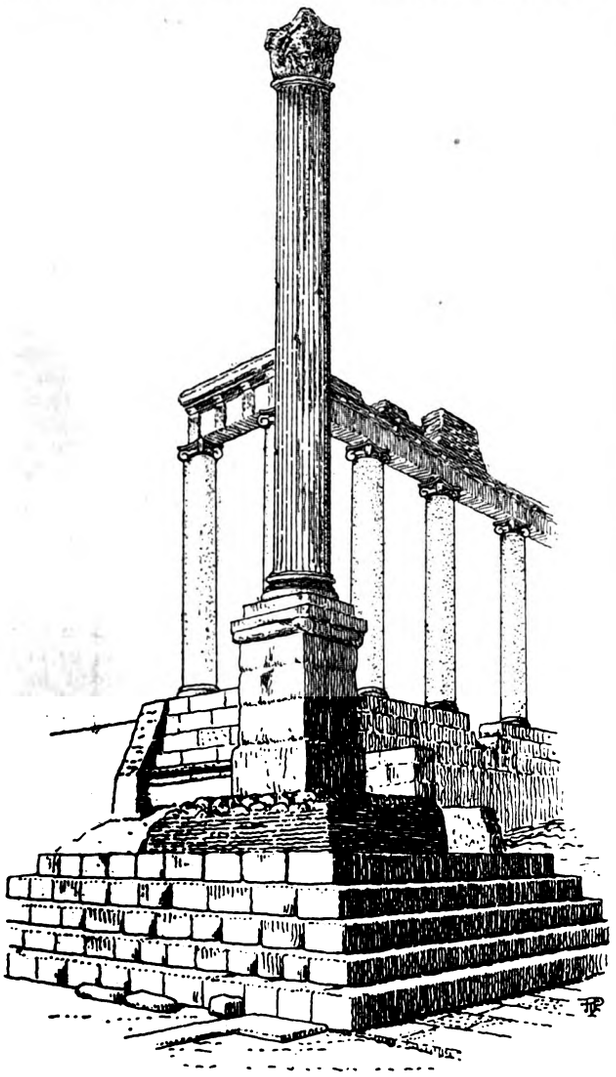

FIG. 4.—COLUMN OF PHOCAS IN THE FORUM ROMANUM.

together were 100 Roman feet in height; but was more generally spoken of as the Antonine, from a mistaken idea in the Middle Ages that it was really the column of Antoninus Pius. Its present height, exclusive of the modern pedestal, is 122 feet 8 inches, and its external diameter is 11 feet 6 inches. The summit, which was a great attraction to mediæval pilgrims, is reached by 203 steps which are lighted by 56 loopholes, each towards a cardinal point, but cleverly concealed by the sculpture; and it is through these loopholes that cracks have formed, and, developing, threatened the stability of the structure.

By the end of the sixteenth century the column had become in so ruinous a condition that its fall seemed to be imminent. The City Council repeatedly held discussions on the subject and more than once employed commissioners to report upon the subject; and it was evidently saved from the fate with which it was threatened by Sixtus V.'s happy discovery that it and Trajan's column also formed first-rate positions for religious statues, and he asked Domenico Fontana's opinion on the subject. He quite agreed with the Pope's idea for the conversion of such Pagan monuments, and he says in his report that "the column of the supreme and best of all Emperors should be dedicated to Petrus, the prince of the apostles, and that of the Emperor-philosopher Marcus Aurelius to the philosophic Apostle Paulus." The Pope therefore instructed the architect to carry the work into execution, although he had already stated that the building "was, partly by age and partly having been burnt by the barbarians, reduced to such a state that it seemed impossible rather than difficult to restore it. Wide cracks rent across the surface, which also offered alarming holes." Nevertheless Sixtus V. was not a man to be baulked in his scheme, nor was the man who had raised the Vatican Obelisk to be daunted by a difficulty; so he built up a circular scaffold to the top, and with marble from the Septizonium, which the Pope had turned into a quarry, he filled in all the holes and cracks, piecing out the sculpture as best he was able, and set about erecting the statue on the top.

Whence the bronze came from for the great image seems uncertain, as sufficient of the material had to be sought for throughout Rome, and it is said that the bronze doors of Sant' Agnese were threatened, but were left to meet their fate later on; and it appears probable that an ancient bronze pilaster of the Pantheon was made to serve.

The condition of the column before Fontana took it in hand is shown in our sketch (fig. 2), taken from an old engraving, which shows not only the great defects in the shaft, but the state that the ancient pedestal had got into denuded of most of the sculptured decoration that doubtless once encased it. The level of the pavement of the square was originally 13 feet lower than the present, and, though Fontana is credited with the design of the present pedestal, there seems some doubt in the matter. On the walls of the Vatican Library is a contemporary fresco showing the column surmounted by the statue of St. Paul and the pedestal in two stages, though different in design from that shown in fig. 2, and quite different to that now existing and showing in fig. 3. The explanation appears to be that the raising of the street level has occurred since the picture was painted and that the lower portion of Fontana's work has been buried, while the sculptured decorations shown on the upper part either were never executed or have been subsequently pared off. So far as his repairs to the shaft are concerned, it is quite possible that the recent earthquake has loosened or even shaken out some of his inserted marble, and the state of the column be no worse than it was when he took it in hand; and what he did once may certainly be done again. The cost of the repairs amounted to 9,284 scudi.

It is interesting to know that the repairs were con-

FIG. 5.—COLUMN FROM THE BASILICA OF CONSTANTINE NOW BEFORE STA MARIA MAGGIORE.

sidered to be quite satisfactory by the Pope, and in October 1588 the column was solemnly inaugurated. A patriarch, after celebrating Mass in San Lorenzo, headed a procession to the square, accompanied by the Papal

Digitized by Google

singers, to bless the column and its statue. Probably it had already been exorcised, as had happened in the previous November to the column of Trajan.

The column of Antoninus Pius met with a more unhappy fate, but when discovered in 1703 it was in a fairly perfect condition, though fallen down and buried beneath ruins. The shaft was a monolith of red granite nearly 50 feet high, which had stood on a richly carved marble pedestal; and Clement XI. instructed his architect, Carlo Fontana, to re-erect it on Monte Citorio. During the operations it was stored in a wooden shed, which, catching on fire, so damaged the shaft that it could not be reused; but the pedestal with high reliefs representing the apotheosis of Antoninus and Faustina was restored, and is now in the Vatican gardens.

The column of Phocas in the Forum (fig. 4) was, until 1816, when its base was excavated, always supposed to be the fragment of a ruined temple; but the inscription then discovered showed that it had been set up as late as 608 by the Exarch Smaragdus in honour of the Emperor Phocas, and was evidently not the work of that period, but had been removed from an earlier, and probably destroyed, edifice.

Of the two columns raised in modern times by the Popes the most important is the one standing in front of Sta. Maria Maggiore (fig. 5), which once was one of the great eight pillars supporting the vault of Constantine's Basilica in the Forum, and stood 62 feet high. It was taken down by order of Paul V. and set up by Carlo Maderno, who designed its base and capital; while the bronze statue of the Virgin which surmounts it is by the sculptor Bertolot. The other column is the one erected by Pio Nono in the Piazza di Spagna in front of the Propaganda. It is a monolith of Cipollino, 42 feet long and 4 feet 9 inches in diameter; and it does not appear to have been before used, although discovered in some excavations made on Monte Citorio. But it may have been rejected for some defects at the lower end now concealed by the modern ornamental bronze work.

Some superstitious people may be struck by the coincidence of the damage this earthquake has done to the Church of St. Agatha of the Goths—S. Agata dei Goti—and to the sculptured representation of the Roman Emperor's triumph over the German hordes of his time. But the omens are eminently favourable, the former indicating German defeat, and the second calling on the Italians of to-day to take a hand, with the rest of civilisation, in the completion of the work which Marcus Aurelius did not quite accomplish.

PASSED BY THE CENSOR?

By NON-IGNOTUS.

IT would seem that poets are not alone in enjoying the privilege of licence and of coining fanciful words and phrases that exaggerate whatever they may be writing about. They have, during the last five months, enjoyed the comradeship of Press reporters and Press photographers, and a fairly nice hash of things some of these good gentlemen of the Press have made of facts and names, little suspecting that some of the readers of their illustrated literature happen to know the localities named and the buildings illustrated better than themselves, on the spot though the P.r.'s and the P.p.'s may have been when despatching their effusions to England for our consumption.

As to the rampant geographical Press misstatements and misprints of place-names (such as the dubbing of Belgian seacoast towns as cities and mere straggling villages as towns, and the gratuitous raising of parish churches into cathedrals, and the mixing up of places in South Belgium with those of North Belgium in alleged telegrams from Holland), the Press agencies have also shown themselves to be masters in the art of Press licence (or Press lie-sense!) and must share the blame accordingly (the employers being responsible for the work of their employees), for their transcribers of telegrams from abroad, in their sapience, have wildly jumped at the most idiotic conclusions on seeing, for instance, in a message from Holland the name of Thourout (near Bruges), and decided on their own that the man at the other end of the wire must mean Turnhout (near the Dutch frontier)

Heyst, too, which is on the coast, is reported to be "near Malines," but the Heyst "near Malines," but nearer Aerschot, is Heyst-op-den-Berg, a straggling village, and not the place on the coast defended by the Germans, where nobody is allowed to enter, nor to depart thence, under penalty of death! The transcriber of the Heyst "near Malines" telegram clearly took, as he has frequently done during the war, an unwarrantable liberty with the original message, and jumped at a conclusion which was as impossible and intangible as it was ridiculous, or pretended he knew better than the telegraphist on the spot.

Almost on a par is "Peverloo, near Liège," in a transcription of a telegram in one of the papers this week. We can find no such place on our very complete map of Belgium, but we know of Beverloo, about half-way between Diest and Moll, which is the Belgian Aldershot.

But one illustrated daily has been surpassing itself in its eagerness to be written by the best authors and illustrated by the best artists, yet anxious not to "give away" any military secrets. On that score the editor would appear, in an instance which we give a few lines lower down, to be on very safe ground.

The paper has been tripped up for calling St. Peter's at Louvain a cathedral; it has twice been called to book for stating, under pictures of the remains of St. Giles's Church, Termonde, that they showed "the principal church which has been entirely destroyed" (which is, apparently, not a fact, and even St. Giles's tower still stands). The principal church is that of Notre Dame, and that information was imparted to the editor on the first misstatement. Then came, among other samples of "licence," a picture of our gracious King conferring with Albert Cœur de Lion, the great King of valiant little Belgium, at a review of King Albert's troops "in a city in Northern France near the Frontier."

We were unaware that Furnes was a city, and in Northern France to boot. However, the grotesque error, on being pointed out to the editor, was corrected under a small reproduction in the weekly issue. Good!

About that time came a view of the bottom part of the transept of a brick and limestone bad Gothic modern village church, whose ruined cupola (*sic*) was stated to be in the *débris* between the transept and the house beyond in the picture. We readers were asked to believe the sacred edifice (of which the part was depicted) was "a cathedral in the North of France!"

We failed absolutely to recognise the magnificent building, nor did we remember any Gothic cathedral in that part of Europe which was near the enemy's guns and which had, till then, been graced by a cupola.

With regard to cathedrals in Northern France, the transcriber of a telegram given in the same paper attributes a phenomenal feat to the Germans. He declares that, among other damage to Soissons Cathedral, they have destroyed the spire there! If that is the case, the spire must have been put up within the last few days, as a view of the cathedral was given in that paper only a few days previously, and a truncated tower is shown as the only thing there in the way of a steeple. But, there! the Censor—so knowing—has permitted the publication of the telegram, and *he* ought to know, as well as does the transcriber!

At the end of 1914, on December 30, the paper gave a startling picture of the roofless interior of a long and very narrow church which had had a central tower, and of which only the lower part of the eastern face remained, balanced over the chancel arch. This poor dilapidated shell was stated to be "German's legacy to Belgium" for the New Year, and to be the remains of a church "in a small town in Belgium."

On being appealed to to state where it was, the editor has maintained a most diplomatic and dignified silence. Evidently the secret was too important a one to divulge, even in the weekly issue which followed.

We have also seen—it was submitted to us for the correct title to be given—a photograph of the Grand Place at Termonde, looking towards the Corps de Gardes ruins and showing the blackened shell of the Hôtel de la Bourse (the name was just visible through the smoke marks between the windows). The knowing party who supplied it to the editor (not the one we have just been dealing with, but of an important weekly) had stuck on the back of it a typewritten label bearing the words, "Termonde: Ruins of the Railway Hotel."

That was too much for us, and we informed the editor that his readers would be gulled if that were allowed to pass.

That photograph did not get inserted.

We presume the Official Blue-penciller to the War Office passed all the above samples of licence as part of his day's work, and that he knows every inch of Belgium and North France, and the name and status of every city, town, village, and hamlet therein, and their correct spelling and accurate location.

If so, we bow to his sapient majesty!

Digitized by Google

But the palm for misstatements cannot, surely, be rightly given to the representatives of Belgium who have just published their report on German atrocities in Belgium. They should know better than to refer to the "Destruction of the Cathedrals of Malines and Termonde." But the signed English translation of the report makes them say such an extraordinary parody of truth as regards Termonde.

Clearly there must be in that translation a lot of verbal alterations by the person or Press agency that supplied the report to the English newspapers. Verbal alterations are always a dangerous game in order not to give away some great military secret. If that is the case, we must reluctantly grin and bear it. We have a lot to thank this war—or the Kaiser—for.

INSTITUTE OF SANITARY ENGINEERS.

MR. A. P. I. COTTERELL, M.Inst.C.E., F.R.San.I., the President of the Institute of Sanitary Engineers, gave his Presidential Address at Caxton Hall, Westminster, on Wednesday, January 6, of which the following is an abstract:—

Ours is no mean profession. Whether in peace or in war, year by year witnesses to its growing importance. The day when the sanitary reformer was brushed aside as an impossible idealist is long since past. Sanitation is now recognised as essential to the world's well-being and those who practise it as an integral and indeed to a large extent as an official part of the nation. It has saved the lives of hundreds of thousands, and has built up strong manhoods where formerly weakness and disease would have flourished. Man is a gregarious animal, and whether in city or village we are becoming more and more dependent upon efficient sanitation. We might even call Sanitary Engineering the handmaid of civilisation, so necessary is she wherever civilisation spreads.

I should like to briefly review some of the progress made by Sanitary Engineering in our own land during the last four or five decades. There have been astonishing changes. Forty years ago few beside the larger towns had an adequate water supply, and the conditions even in some of these left much to be desired. Now, almost every town and many villages have their public water supply; the larger towns, concurrently with an influx of population, have improved theirs out of recognition; lakes have been constructed or tapped to provide for the wants of densely populated cities, whilst many others are drawing far afield upon the resources of the country. London stands by herself. She has enormously increased her reservoir accommodation and is engaged in still further extensions for the purpose of utilising to the full her present sources of supply. Incidentally, by means of storage she has also succeeded in improving the quality of the water.

In the department of sewerage and sewage disposal even greater advance has been made than in water supply. In one sense the art of sewage disposal may be said to have been created in the last forty years. I do not mean that before this period very little was known of the principles of sewage disposal, for I am one who holds that the past has much more to teach us than we are generally ready to admit. But there has been material advance with more and more confident step. Forty years ago only the larger towns possessed a sewerage system, now many of our villages are provided. Then, the disposal of sewage was at the best embryonic except in a few enlightened instances, now we can design disposal works with practical certainty that they will fulfil the purpose intended if properly looked after.

It is in the utilisation of sludge that the greatest activity is at present being shown. After the disappointments and losses that have been the lot of investigators in years past, it is not surprising that a few years ago the search was almost given up and every effort made to get rid of sludge in the quickest and cheapest possible way.

The notable success of Bradford in transforming the greasy constituents of its sewage into a source of revenue has had an effect in drawing attention once more to this wasted source of national revenue. At Bradford, I understand, the recovery of fats produces so large an income that much of the annual upkeep of the works is thereby paid for, and the authorities go out of their way to encourage the introduction of trade wastes from the factories into the sewers.

Another scheme for the treatment of sewage sludge was described by my predecessor in this chair. It is in operation at Dublin, and is, I understand, to be introduced shortly on a large scale at Birmingham. Mr. Watson described the process so fully in his Address that I need not again particularise. Suffice it to say that it consists of two main sections:—

1. Fermentation of the crude sludge by the addition of yeast with separation of the resultant water, which in this case is drawn from underneath the thick scum formed by the fermentation.

2. Drying the sludge after the incorporation of phosphates and potash and its conversion into a fertiliser.

I have had occasion recently to examine professionally a method of sludge utilisation that is being worked by a company who have lately erected a plant at Wimbledon capable of dealing with twenty-five tons of sludge per day. This undertaking boldly sets out to recover the valuable constituents of the sludge, and claims that effective uses can be found for all of them.

Manchester has just brought to our notice still another process. It has several points of novelty in that it proposes so to perfect the preliminary or tank treatment of sewage as to do without filtration altogether.

I ought not to omit mention of the notable work done by the Royal Commission on Sewage Disposal. They have been a long time about it, but they have certainly left their impress on the problem. Much of their work may have been merely to systematise existing methods, but their last Report strikes out much more boldly, in that it proposes to resume the discarded method of purification by dilution and to introduce sewage into the streams in a more or less crude form, under scientific control, relying upon the previously ascertained exygenating resources of the river to complete the purification.

I ought not to allow this portion of my subject to go by without drawing attention to the great advance that has taken place in the disposal of refuse. Those appalling heaps of rubbish that used to disgrace the thickly populated portions of our cities are not so numerous as they used to be. One of the finest sanitary developments of modern times has been the institution of the destructor. We have come back to the ancestral use of fire for the disposal of our refuse. May it be our fortune to see it extend to the disposal of our dead and so revert to a practice in which our forefathers were wiser than we.

I am going to ask you to consider with me the problem of housing in so far as it affects the poorer classes of our people both in the city and in the country. I submit that it is a subject not only germane to the aims of the Institute, but one in which we have a direct interest. We touch it as citizens, but we also come in contact with it in our profession. It will fall to the lot of many to assist in the solution of the problem, and just as we have had our part in improving the sanitation of the country in the past, so we ought also to find a place in the future in helping toward the provision of better houses for the people.

There is another way of looking at the subject. Whilst we have been engaged in works of water supply and sewerage, and whilst sanitary services have been improved, good as all these are, they have in a sense made it more difficult for the small householder to secure a satisfactory home. For, as a direct consequence of such outlay, the rents are bound to rise, and unless wages rise concurrently with the growing rent and cost of living the last state of the cottager is worse than the first.

Every city has its slums and the countryside its mean dwellings. I am glad to admit that the conditions both of the town dweller and of the countryman have vastly improved under the same impetus that has brought about such sanitary progress in other directions. In the towns the Housing Acts and municipal diligence, coupled with private example, have either abolished many slum areas or so altered the dwellings of those who lived there as to make them moderately habitable.

Since the passing of the Housing Act of 1909 we have entered a new era. Many localities are taking advantage of the new powers placed in their hands with admirable results, and are endeavouring to make up for the deficiencies of former days.

It may reasonably be asked whether this course does not involve a serious interference with private enterprise, and whether the public provision of houses should only be encouraged as a strictly temporary measure. For my own part I deprecate State interference if the object aimed at can be obtained in another way. But it is not likely that the public control of housing will ever be relaxed, although it may be that private enterprise will so rise to the occasion that public outlay can be reduced. Yet I am inclined to think that public expenditure in housing will continue for

Digitized by Google

some time to come. It is a heavy responsibility, of course, for a locality to undertake, but there is security for the outlay at least as good as upon sewerage and water works which, with the abandonment of the houses served, would become of very little value.

We need not conclude that insanitary houses are always due to the neglect of an absentee landlord. It is far too often the small owner or the actual occupier who is also the owner whose property is in such a deplorable condition. The difficulty is intensified when such a cottage is both owned and occupied by a poor widow whose little all is in the property, and who really has not the means to carry out the necessary sanitary alterations.

As regards overcrowding or insufficiency of accommodation, it sometimes arises through the influx into the locality, either permanently or temporarily, of some of the better-class town dwellers who like to have a country cottage to retire to, but who do not realise that this makes one house the less for the indigenous population.

Any traveller by some of our main lines out of London, looking through the windows, must pity the circumstances of the dwellers in the mean streets and dirty courts that he passes. Something of the same kind of thing can be seen in many provincial towns where the railway runs in embankment or on viaduct.

There are other problems mixed up with that of housing when the poorest poor are considered. There is the question of utterly insufficient wages to meet an economic rent, of inability to rise out of the slough in which they have lived so long, of want of resource, and of a love for a herded life in narrow courts or congested buildings.

The able investigations carried out by Booth and Rowntree, and the noble lives lived by Octavia Hill and others like her, have probably done more than anything else to rouse the public conscience in the matter of urban housing. The nation had to do it when it came to know the facts. We can gladly acknowledge the efforts made by London and by many of our large cities to house some of their population under better conditions. Liverpool is shouldering a rate of 1½*d.* in the £ in order to house at rents of from 9½*d.* to 2*s.* 9*d.* per week people unhoused from insanitary areas who were utterly unable to rent a decent dwelling. The Corporation declare that it pays them handsomely. Typhus has practically disappeared, the typhoid death rate has fallen nearly 75 per cent. in ten years, the mortality rate has been reduced from 50 to 27 per 1,000, public-houses have been swept away, and the police are losing their usual employment. Colonel Kyffin-Taylor, M.P., the chairman of the Corporation Housing Committee, says: "Some of the tenants in our buildings so improve their position that they ask for and obtain our better houses, and some get well to do and go further out into houses built by private enterprise. It is untrue to say that these people will make slums of any place they go to. It is easy for folk who live in charming houses, wear lovely clothes, and have lovely gardens, to say that environment makes no difference. Liverpool says that in its experience that statement is wholly untrue. Fifteen years ago the people objected to being disturbed. Now some of them want to be disturbed, and are anxiously waiting their turn, and those whom we have rehoused have learned to realise and value their surroundings to such an extent that money that previously went in one direction now goes in another, and they have new aspirations, new ideals, new hopes."

There is one part of the United Kingdom where very notable progress has been made in housing. It is where perhaps one would least have expected to find it—viz., in the rural districts of Ireland. These changes have been brought about by a wise administration of the law under successive ministries. From 1883 to the end of 1912 no less than 42,640 cottages were built by 211 out of the 213 rural district councils of Ireland at an average cost, including buildings, roads and land, of £185 per house, and containing usually one living room and three bedrooms. Of the above number more than half have been erected since 1906. It has been possible to carry out this great work because the State undertook a substantial contribution towards the cost, amounting practically to 36 per cent., and the houses built can therefore be let at low rents within the compass of the wages of those who inhabit them.

In England changes are also taking place. The erection of better cottages in urban and rural districts, and the development of estates to rehouse congested areas, is also proceeding. I ask that it should not be allowed to slacken during this time of stress and of prodigal expenditure in other directions. The fact that immediately after the declaration of war an Act was passed through all its stages in one day, providing for the issue of £4,000,000 for housing purposes, although not very much when compared with the huge sums now being spent by the nation, shows the importance attached by the legislature to the subject.

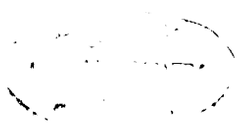
The cost of building naturally varies in different parts of the country, and according to the accommodation considered necessary. The houses already erected in districts in England that have undertaken housing appear to run from £300 to £160 per house. A concrete cottage exhibition held recently produced designs for buildings containing a living-room, scullery with offices, and three bedrooms for £125, exclusive of builder's profit, sanitary fittings and drainage, fences or land, which, if added, would total up to much the same outlay as ordinary buildings. I think, therefore, that we may take these as rock-bottom prices.

Under the favourable loan conditions hitherto allowed it has been found possible by local authorities to let houses of the values named at rents varying from 7*s.* to 5*s.* a week, and in a few cases rather less before a point is reached where, as in Liverpool and in Ireland, a part of the rent has to be paid by others. These are lower rents than private enterprise can possibly afford to charge even with land acquired on the same terms. The consequence must be that private house building for the poorer classes will tend to be cut out, and the onus of providing the necessary cottages will fall upon the local authority. An immediate consequence of this legislative change may easily be a shortage of houses and worse sanitary conditions unless localities are stirred up to undertake the duties now placed upon them by the State.

In these days of improved and improving traffic facilities the wider spacing of the country's workshops is not impossible. Hence I think that we can support the development of new suburbs, making them garden towns if you will, and design them for happier conditions than can ever be made of the old unhealthy areas. We can advocate also the grouping of our agriculture population in new and better cottages, so that life both in city and in country may be more like what it ought to be.

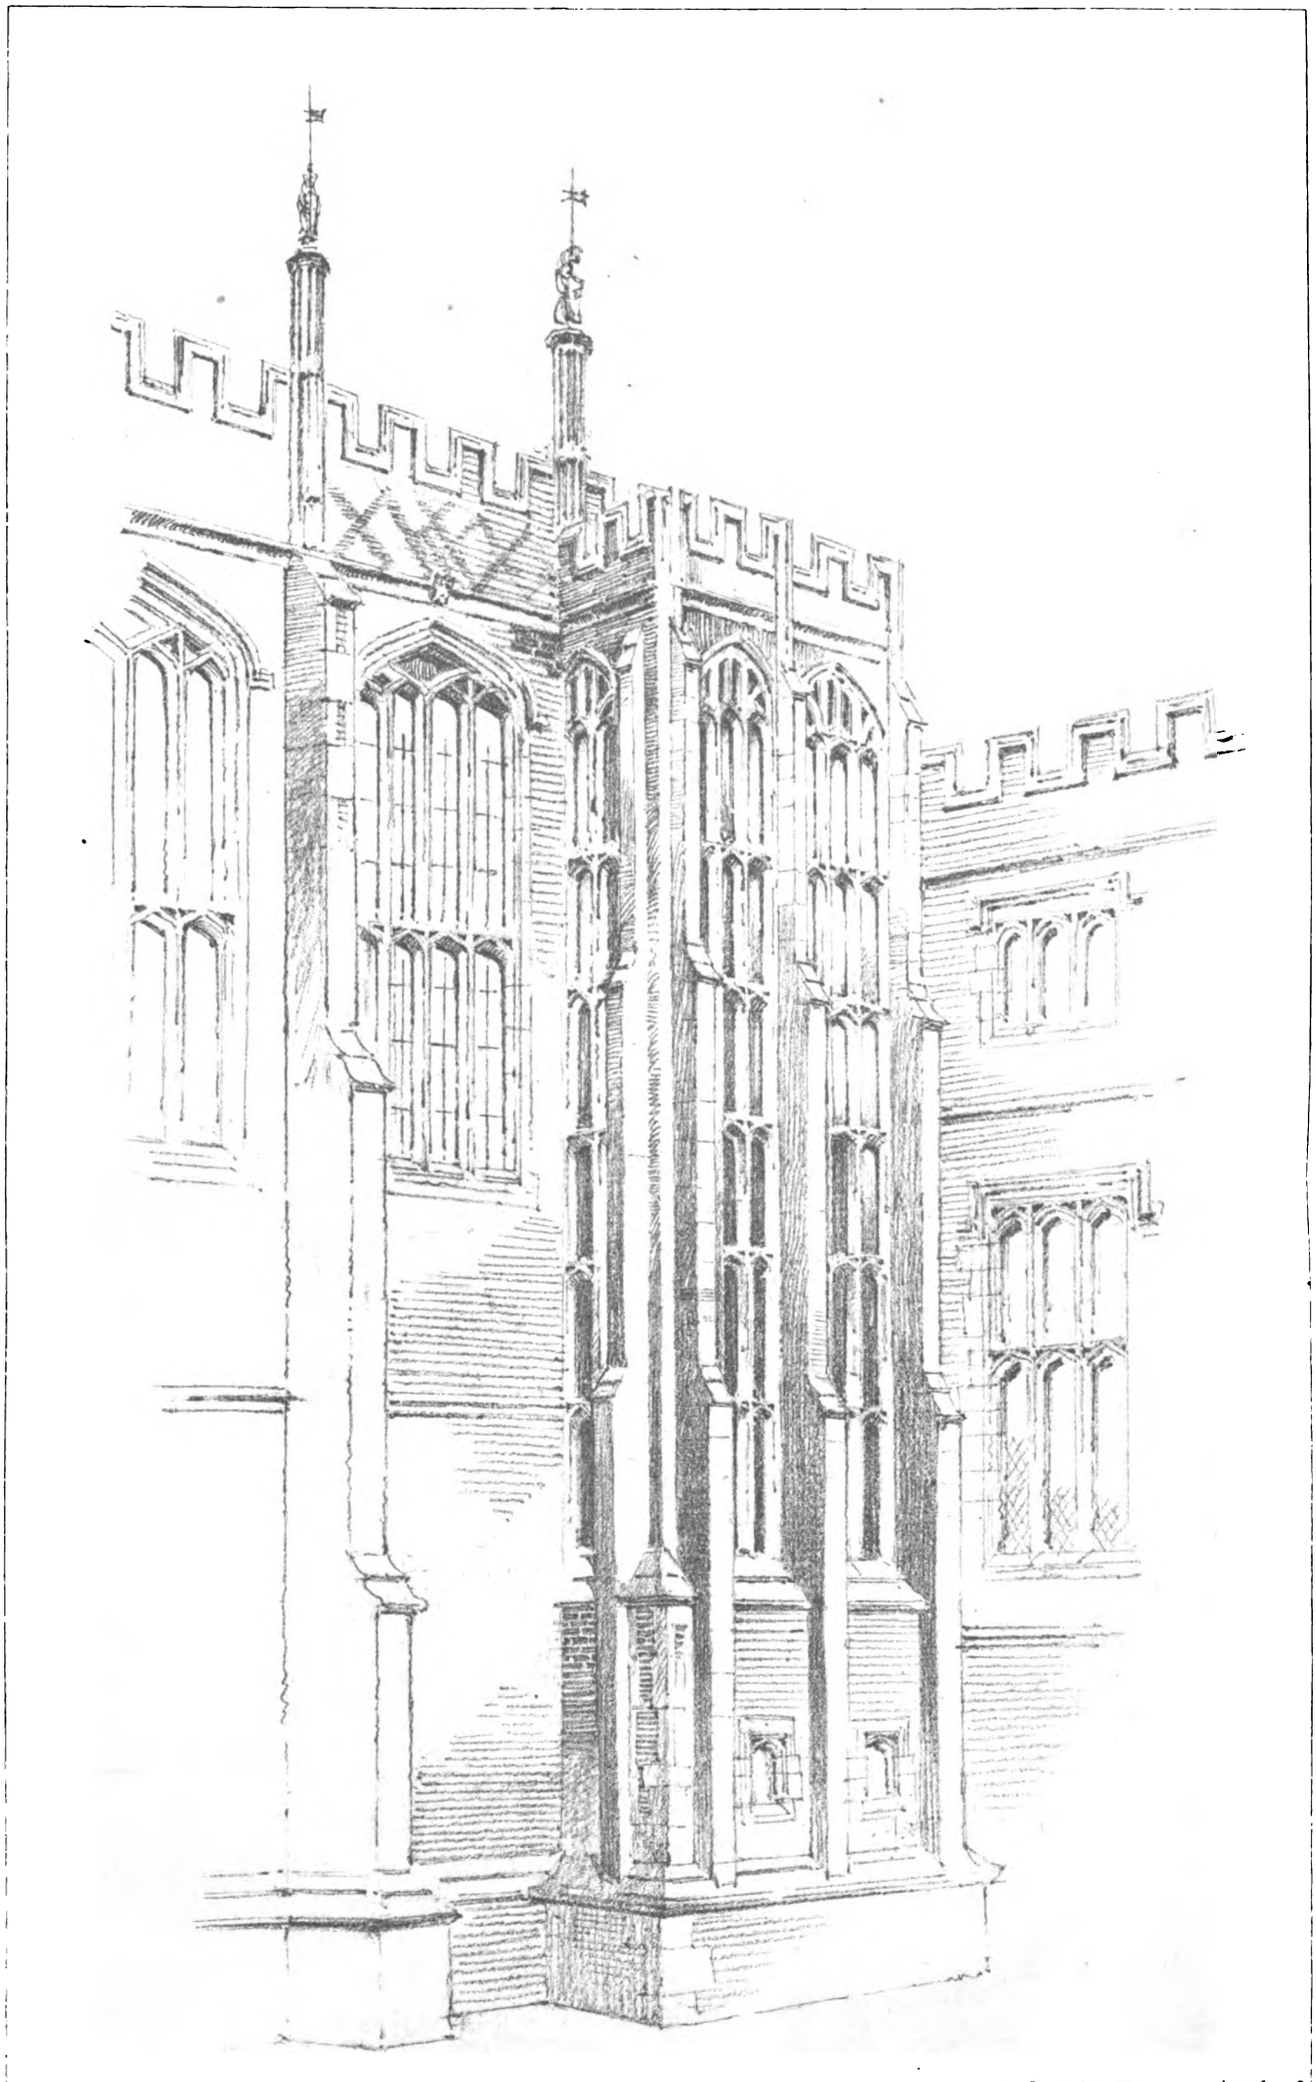
There is another feature of housing that must not be overlooked. The working man of to-day now needs and is entitled to demand better amenities and greater conveniences than were considered necessary forty or fifty years ago. He has been educated by order of the State, and his outlook on life has been completely altered thereby. All this has brought about a standard of comfort unknown to previous generations.

Then again, sanitary teaching pressed home year after year has made us to be a cleaner nation than we were. But cleanliness cannot be got for nothing. It costs to be clean. The mother who sewed her boy up for the winter did it with the object of economy as well as the man who, according to a well-known advertisement, omitted to use soap for quite two years. It is all right to provide greater cubic space, better windows, a bath, and other sanitary conveniences, but they not only affect the first cost, they increase the annual upkeep of the tenant.



Has the wage paid kept pace with the growth of requirement? Is it not a fact that the cost of housing alone, to say nothing of other things, has outstripped the wage paid to the householder? Should the workman still be expected to spend so large a proportion of his income on rent when his family has so many other needs to be satisfied before it can fulfil its duty to the State?

It may be said that these questions might have been answered a year ago, but now that the nation is struggling for its existence all such things have to be put aside. It would be a poor victory that succeeded in overcoming other nations but failed to maintain the vitality of our own. And this is recognised. Whilst large sums are being poured out for the maintenance of the Navy and of the Army in the field, for the first time in our history, I believe, we are also caring for the wives and dependents at home. Steps have been taken and duties shouldered that cannot be entirely abandoned. It has been done because we know it is as true to-day as when Canning used the words 100 years ago:—



> "Princes and kings may flourish or may fade,
> A breath may blast them as a breath has made;
> But a bold peasantry, our country's pride,
> When once destroyed can never be supplied."

We can therefore never be quite the same again. We have undertaken a responsibility towards one another that should not be entirely set aside. It is an outcome of the spirit of the age—a spirit that will continue after the responsibilities raised by the war shall have passed away.

SHEFFIELD SOCIETY OF ARCHITECTS.

AT the Sheffield University Mr. A. B. Burleigh, of York, delivered a lecture to members of the Sheffield Society of Architects and Surveyors on the 13th inst. His subject was "Castle Howard: its History and Architectural Features and its Artistic Treasures." The lecturer opened with some account as to the proper lighting of picture galleries, especially roof lighting, and spoke very highly of the arrangements in the galleries of Castle Howard. He dealt at length with the history of the family, and with the variety of Vanbrugh's genius. He went into considerable detail respecting the plans of the famous Yorkshire mansion, and its mausoleum, whose sheer magnificence made Horace Walpole declare that "it almost tempted him to be buried alive!" The paintings and other treasures were described, the whole lecture being illustrated by limelight views taken from photographs secured by the lecturer, to whom a hearty vote of thanks was accorded at the close.

TESTS OF BOND BETWEEN CONCRETE AND STEEL.*

(Concluded from last week.)

(41) THE mean computed values for bond stresses in the six-foot beams in the series of 1911 and 1912 were as given below. All beams were of 1-2-4 concrete, tested at two to eight months by loads applied at the one-third points of the span. Stresses are given in pounds per square inch.

	Number of Tests	First End Slip of Bar	End Slip of 0.001 in.	Maximum Bond Stress
1 and 1¼-inch plain round	28	245	340	375
¾-inch plain round . .	3	186	242	274
⅝-inch plain round . .	3	172	235	255
1-inch plain square . .	6	190	248	278
1-inch twisted square .	3	222	289	337
1⅛-inch corrugated round	9	251	360	488

(42) In the beams reinforced with plain bars end slip begins at 67 per cent. of the maximum bond resistance; for the corrugated rounds this ratio is 51 per cent., and for the twisted squares 66 per cent.

(43) The bond unit resistance in beams reinforced with plain square bars, computed on the superficial area of the bar, was about 75 per cent. of that for similar beams reinforced with plain round bars of similar size.

(44) Beams reinforced with twisted square bars gave values at small slips about 85 per cent. of those found for plain rounds. At the maximum load, the bond-unit stress with the twisted bars was 90 per cent. of that with plain round bars of similar size.

(45) In the beams reinforced with 1⅛-inch corrugated rounds, slip of the end of the bar was observed at about the same bond stress as in the plain bars of comparable size. At an end slip of 0.001 inch, the corrugated bars gave a bond resistance about 6 per cent. higher and at the maximum load about 30 per cent. higher than the plain rounds.

(46) The beams in which the longitudinal reinforcement consisted of three or four bars smaller than those used in most of the tests gave bond stresses which, according to the usual method of computation, were about 70 per cent. of the stresses obtained in the beams reinforced with a single bar of large size. The progressive opening of cracks with increase in load was well shown in these tests. These beams showed cracks nearer the ends than usual. The distances of the outermost cracks from the ends of the beams suggest that the unbroken length of embedment has an important bearing on the maximum loads which the beams may be expected to carry before failing by bond. It seems probable that the lower computed bond stresses in these tests are due to errors in the assumptions made as to the distribution of bond stress and not to actual differences of bond resistance in the bars of different size.

(47) The tests on beams with the loads placed in different positions with respect to the span gave little variation in bond resistance during the early stages of the tests. The maximum bond resistances increased rapidly as the load approached the supports. These tests indicate that the variation in the maximum bond stresses must be due to the presence of other than normal beam action.

(48) Nearly all the beams tested on span lengths of 7 to 10 feet failed by tension in the steel and did not develop the maximum bond resistance, although high bond stresses were obtained. The bond stress corresponding to first end slip of bar did not vary much with the span length.

(49) The bond stresses developed in the beam tests indicate that with beams of the same cross-section the bond stresses are distributed in the same way during the early stages of the test in beams varying widely in span length and loading. During the later stages of the test the distribution of bond stress seems to depend largely upon the conditions of stress in the concrete through the region of the span where beam bond stresses are high. The distribution of bond stresses in beams of different cross-section apparently varies with the relative dimensions of the beam and the reinforcing bars.

(50) The use of auxiliary tensile reinforcement in the outer thirds of the beam served to modify the distribution of bond stress during the early stages of the test, but did not have any influence on the maximum bond resistance. While the auxiliary bars seemed to prevent the opening of outer cracks, the tests indicate that interior cracks which did not appear on the surface of the beam may have opened to an extent that permitted the same distribution of bond stress as was found in other tests.

(51) Increasing the thickness of the concrete below the reinforcing bars beyond the depth usually employed caused a very large increase in the resistance to bond and web stresses. The added stiffness of the beam and the increased flexural strength through the outer thirds of the span prevented the formation of cracks in these regions. In the other beam tests such cracks were found to interrupt the continuity of bond action and to be an important factor in producing lower average bond resistances.

(52) Increasing the length of overhang of the ends of the beam beyond the support did not increase the resistance to web stresses as indicated by the opening of outer cracks, but it had an influence on the bond resistance. The bond resistance at first end slip was greater in the beams with the longer overhang. The maximum bond resistance was materially increased by the additional overhang.

(53) In the reinforced concrete beams it was found that very small amounts of slip at the ends of the bar represented critical conditions of bond stress. For beams failing in bond the load at an end slip of 0.001 inch was 89 per cent. to 94 per cent. of the maximum load found in beams reinforced with plain bars, and 79 per cent. of the maximum load for similar beams reinforced with corrugated bars. As soon as slip of bar became general, other conditions were introduced which soon caused the failure of the beam.

(54) The bond stresses developed in a reinforced concrete beam by a load applied as in these tests varies widely over the region in which beam bond stresses are present. High bond stresses are developed just outside the load points at comparatively low loads. The load which first developed a bond stress nearly equal to the maximum bond resistance in the region of beam bond stresses produced a stress near the support which was not more than about 15 to 40 per cent. of the maximum bond resistance. As the load is increased, the region of the high bond stress is thrown nearer and nearer the support, and at the same time the bond stress over the region just outside the load point becomes steadily smaller. This indicates a piecemeal development of the maximum bond stress as the load is increased. The actual bond stresses in certain tests varied from less than one-half to more than twice the average bond resistance computed in the usual manner.

(55) Slip of bar in a reinforced concrete beam has a marked influence in increasing the centre deflection during the later stages of loading.

(56) The comparison of the bond stresses developed in beams and in pull-out specimens from the same materials is of interest. Such a comparison should be made for similar amounts of slip. In the pull-out tests the maximum bond resistance came at a slip of about 0.01 inch for plain bars. The mean bond resistance for the deformed bars tested was not materially different from that of the plain bars until a slip of about 0.01 inch was developed; with a continuation of slip the projections came into action, and with much larger slip high bond stresses were developed. The beam tests showed that about 79 to 94 per cent. of the maximum bond resistance was being developed when the bar had slipped 0.001 inch at the free end; hence the bond stress developed at an end slip of 0.001 inch was used as a basis

of the principal comparisons in the pull-out tests. However, it is recognised that, under certain conditions, the stresses developed at larger amounts of slip may have an important bearing on the effective bond resistance of the bar.

(57) The pull-out tests and beam tests gave nearly identical bond stresses for similar amounts of slip in many groups of tests, but it seems that this was the result of a certain accidental combination of dimensions in the two forms of specimens and did not indicate that the computed stresses in the beams were the correct stresses. However, it is believed that a properly designed pull-out test does give the correct value of bond resistance, and gives values which probably closely represent the bond stresses which actually exist in a beam or other member as slipping is produced from point to point along the bar. The relative position of the bar during moulding may be expected to influence the values of bond resistance found in the tests.

(58) A properly made pull-out test on a specimen of correct design is a valuable aid in determining the bond resistance of reinforcing steel in concrete, if due consideration is given to the load-slip relation. The tensile stress in the bar should be kept well below the elastic limit. Best results will be obtained by using a relatively short embedment. An embedment of eight diameters is recommended.

(59) A working bond stress equal to 4 per cent. of the compressive strength of the concrete tested in the form of 8-inch by 16-inch cylinders at the age of twenty-eight days (equivalent to 80 lb. per square inch in concrete having a compressive strength of 2,000 lb. per square inch) is as high a stress as should be used. This stress is equivalent to about one-third that causing first slip of bar, and one-fifth of the maximum bond resistance of plain round bars as determined from pull-out tests. The use of deformed bars of proper design may be expected to guard against local deficiencies in bond resistance due to poor workmanship, and their presence may properly be considered as an additional safeguard against ultimate failure by bond. However, it does not seem wise to place the working bond stress for deformed bars higher than that used for plain bars.

Concluding Remarks.—The tests described in this bulletin have thrown considerable light on the value of bond resistance and the distribution of bond stress for a wide range of conditions in both beam and pull-out tests. It may not be expected that all of the results indicated can be applied without modification to members in which the conditions of stress differ widely from those present in the tests.

Most of the foregoing discussions and conclusions are based on comparisons involving the load-slip relations. In a few of the tests the bond stress was determined from a study of the variations in the tensile stress in the reinforcing bar. The latter method furnishes a much more direct means of measuring the bond stress, but it has been available only since the recent development of a non-fixed extensometer. Additional tests are planned which are expected to give further information on this subject.

BUILDING PROGRESS IN THE PROVINCES AND SUBURBS.

A LIST OF WORKS PROJECTED OR COMMENCED.

(N.B.—Local Authorities, architects, and others are invited to submit full particulars for insertion in this weekly list. Where districts are not entered against names of architects and builders the address is as a rule local.)

ENGLAND.

BEDFORDSHIRE.
Bedford.—Workhouse Infirmary: sick wards, for B.G. (£6,800).

BERKSHIRE.
Reading.—No. 15 Church Street, Caversham. Mr. G. Millar, architect.

CHESHIRE.
Stockport.—Proposed Council schools at Higher Brinkway, Great Moor and Mid Reddish.

CORNWALL.
Falmouth.—Infectious diseases hut and disinfecting chamber, for H.M. War Office.

DERBYSHIRE.
Shuttlewood.—Mixed Council school for 320 places.

DEVON.
Babbacombe.—Proposed fourteen houses, near St. Anne's Terrace, for Mr. Wiltshire.
Plymouth.—Asylum: extensions. Messrs. Thornely (F.R.I.B.A.), Rooke, and Barron, architects, 11 The Crescent.
Teigngrace.—Church school.

DORSET.
Portland.—Six workmen's cottages, St. Martin's Estate (£1,400).

DURHAM.
Sunderland.—Bede Collegiate school (£30,000).

ESSEX.
Brentwood.—Proposed isolation hospital.
Maldon.—Caretaker's lodge and lavatories at the recreation ground. Council surveyor.
Pattiswick and Rayne.—Proposed working-class dwellings, for Braintree R.D.C.

GLOUCESTERSHIRE.
Avonmouth.—Cold store and general warehouse, E. Wharf, Royal Edward Dock.
Cheltenham.—Public elementary school, Charlton Kings.
Over.—Tuberculosis hospital.
Pebworth.—House. Messrs. Knight & Hebery, architects, 5 Rother Street, Stratford-on-Avon.

HAMPSHIRE.
Aldershot.—Four workmen's dwellings (£800).

HEREFORDSHIRE.
Hereford.—Business premises, Commercial Street. Messrs. Groome (A.R.I.B.A.) & Bettington, architects, Palace Chambers, King Street.

HERTFORDSHIRE.
St. Albans.—Proposed Council roadmen's cottages, Potter's Crouch.

KENT.
Broadstairs.—Town depôt (£2,700).
Mersham.—Smallpox hospital, for East Ashford R.D.C.
Tenterden.—Proposed Council school.

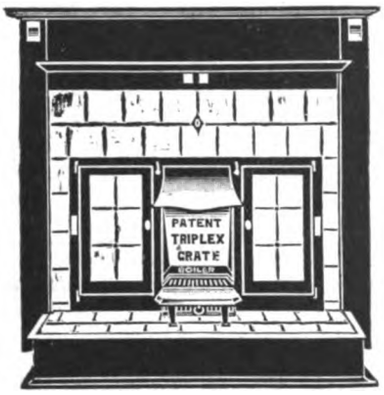
LANCASHIRE.
Ashton-under-Lyne.—Secondary school (£20,000).
Barrow-in-Furness.—Four houses, Longreins Road. Messrs. J. H. Neal & Son, Ltd., builders, Abbey Road Bridge.
Forty-five houses, Dartmouth Street, for Messrs. Vickers, Ltd.; also
Forty-eight houses, Liverpool Street; also
Power house, Bridge Road.
House, Dunoon Street, for the Cavendish Park Estates Company; also
Four houses, Farm Street.
Five houses, Newcastle Street, for Mr. P. H. Fisher.
Two houses, corner of Oxford Street and Clarence Road. Mr. J. Neal, builder, 170 Ainslie Street.
Burnley.—The "Angel" Inn, Accrington Road and Sandygate: rebuilding and enlargement, for Mr. J. Forrest.
Oldham.—Sanatorium, Strinesdale. Messrs. Taylor & Simister, architects, 29 Queen Street.
Wigan. — Infirmary: additions. Messrs. Ralph (F.R.I.B.A.) & Son, architects, Leader's Buildings, King Street.
Proposed Rose Bridge Council school, Peel Street, Ince (£12,500).

LEICESTERSHIRE.
Lutterworth.—Seven Council cottages, Leicester Road.
Market Harborough.—Five houses, Wartnaby Street, for Mr. Garlick.
Shepshed.—Working-class dwellings.

LINCOLNSHIRE.
Grantham.—Proposed R.C. school.
Lincoln.—The John Dawber Memorial Sanatorium (£11,000).
Spalding.—Children's homes, for B.G.

MIDDLESEX.
Ealing.—Workmen's dwellings (£5,300).
Friern Barnet.—The "Railway" Hotel: alterations.

MONMOUTHSHIRE.
Abertillery.—P.M. schools, Somerset Street (£2,000).
Pontypool.—County school, Tranch (£9,100).



NORFOLK
Smallburgh.—Workhouse infirmary: alterations to females' section. Mr. Dale, architect.

NORTHAMPTONSHIRE.
Brackley.—County school. Messrs. Law & Harris, F.R.I.B.A., architects, 1 Sheep Street, Northampton.

NORTHUMBERLAND.
Alnwick.—Eighteen Council houses.

THE "TRIPLEX" PATENT Combination SITTING ROOM GRATE

One Fire does the Work of the Household

Entirely solves a Great Domestic Problem.
Two good Ovens that will bake Bread.
Abundance of Hot Water, equal to 2 Hot Baths per hour.

A cheerful Sitting Room Fire.
Great Economy in Fuel.
Entire absence of Dust or Dirt from Fire.
No Blackleading required.

Specially Designed for BUNGALOWS, FLATS, and MODERN HOUSES.

Complete Specification sent on Application.

HORRELL & BOWMAN,

Range and Grate Makers,
508-510 MOSELEY ROAD,
BIRMINGHAM.

Any of the above specifications may be obtained from J. D. Roots & Co.

Correspondence

[The Editor will not be responsible for the opinions expressed by Correspondents.]

Lessons from the Enemy.

SIR,—I note that in the article of your last issue, headed "Lessons from the Enemy," you advocate the collaboration of English architects, builders, &c., in the re-edification of ruined Belgium. This, of course, may prove very desirable under proper conditions, but, as regards architects, do you not somewhat overlook the claim and capacity of the Belgian professional with his established methods and traditions and his superior local knowledge of every description? As regards one part of the problem, that of the reparative treatment of injured antiquity—including, it may be, whole quarters in different townships—that is obviously best left in the hands of those who have specialised (and they are not few) in their ancient national style, providing they will exercise, as far as the circumstances permit, a conservatism somewhat foreign to their past practice in "restoration." But even where an entirely new departure may be needed surely we should guard against imposing our own methods and ideals on our neighbour, for it would be an added misfortune—and savouring, indeed, too much of the enemy's principles—if the renovation following on destruction were to proceed on lines of a mechanical and ready-made uniformity, and that of an alien type. Sentiment as well as business must enter into the matter, and nationalism and localism must be allowed due scope, else "the restoration of Belgium" will be a misnomer. The problem is no doubt a difficult one, and perhaps the most practical solution would be a temporary and speedy reconstruction pending a permanent one thought out and carried out at leisure under the guidance of the men on the spot.

As to the influence of events on our organisation of things at home, I trust that one of the "Lessons" we shall learn will be that State omnipotence, however valuable as a war expedient, is an enemy characteristic to be strenuously rejected under the normal conditions of peace.—I am, yours obediently,

W. RANDOLPH.

January 20, 1915.

Architects and Contractors and Income Tax.

SIR,—As many architects and contractors have been adversely affected by the war, I should like to draw the attention of your readers to the concession which was granted by the Chancellor a short while ago.

Where the profits of the present year have fallen below the average of the previous three years, a taxpayer has the right to bring into the average the profit for this year in place of that for the first of the three years already taken into average.

An example will perhaps more clearly illustrate this.

Let us suppose a taxpayer's profits for the years 1911, 1912, and 1913 have been £1,500, £1,200, and £1,500 respectively, then the assessment levied upon him for 1914-15 would be upon the average of these three amounts—viz. £1,400. But if this taxpayer could prove that his profits had dropped to, say, £300 for 1914, then he would be entitled to take the average of the three years 1912, 1913, and 1914, and in this particular case this would be £1,000, so that a saving of tax would be effected upon £400, which at the high rate at present in force would mean a considerable amount.—I am, Sir, yours faithfully,

THE INCOME TAX RECLAMATION ASSOCIATION, LTD.,
WILFRED T. FRY, *Secretary.*

Architects' War Service Bureau.

SIR,—I should be glad if you would again grant me space in your Journal to discuss recruiting for the Army.

The Architects' War Service Bureau is in a position to advise professional and business men, and men of skilled trades, as to the branch of the Forces in which they can best serve the Government, and for which they are personally most suited.

More particularly we are recruiting for the Royal Engineers and Sanitary Companies. But we are also at present making a special effort to recruit a gun section for the R.F.A. Howitzer Reserve, to be composed of professional and business men, who will serve together.

Lastly, since the War Office has officially recognised the Volunteer Training Corps now existing in London, no man, whatever his age or circumstances, has any excuse for not being a member of a military organisation. Those who can join the Regular Forces should do so at once; those who cannot should join the Architects' Volunteer Training Corps, which is recognised by the Architects' War Committee, the Surveyors' Institution, the Auctioneers' and Estate Agents Institution, the Junior Art Workers' Guild, and the London Master Builders' Association.

By doing so they can materially help the recruiting authorities to distinguish between the "willing" and "unwilling" members of the community.

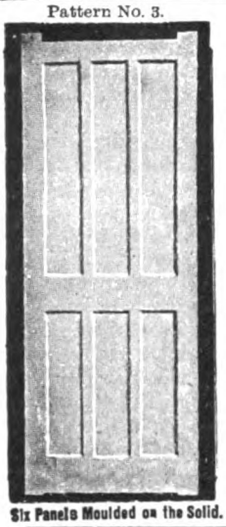
All recruits should apply direct to 18 Tufton Street, Westminster, S.W.—Yours faithfully,

ALAN POTTER,
Hon. Recruiter, A.V.T.C.
18 Tufton Street, Westminster, S.W.: Jan. 19, 1915.

ACCORDING to a report issued on Monday last by the Board of Trade concerning unemployment in the United Kingdom, architects and artists seem to be among the worst hit of the professional classes.

THE Department of Prints and Drawings of the British Museum is once more to be enriched by a handsome bequest of very fine water-colours. By his will the Rev. C. J. Sale, at one time Rector of Holt, near Worcester, left to the British Museum his choice collection of about one hundred water-colour drawings by David Cox, Turner, and Peter de Wint, his widow to retain possession of them during her lifetime. She died recently, and in due course the drawings will pass to the care of Mr. Campbell Dodgson. In all likelihood they will be publicly exhibited, but they will first have to be carefully remounted.

THE International Garden Cities and Town Planning Association have arranged a two days' conference at the Guildhall on February 15 and 16 to discuss the possibility of rebuilding Belgium on garden city lines. The Lord Mayor will welcome the guests, and an opening address will be given by Mr. Herbert Samuel, President of the Local Government Board. Belgium will be officially represented by M. Hellepute, Minister of Agriculture and Public Works, and others, and visits will be arranged to places of architectural and town planning interests in various parts of the country.



A FOURTH Memorandum on the operation of the Housing, Town Planning Act of 1909 states that the activity on the part of local authorities in regard to various phases of the housing question, as well as in regard to town planning, increased materially during the year 1914. At the cost of landlords or owners 64,332 houses were made fit for habitation in the past year, the total for the four years being 194,668. Loans to the amount of £1.074,521 were sanctioned for the purchase of land and erection of houses for the working classes, the number of houses to be erected being 4,223.

THE R.I.B.A. Board of Architectural Education inform us that in connection with the recent final and special examination the Ashpitel Prize for 1914 was awarded to Mr. George Eric Francis, of 115 Newlands Park, Sydenham, he being the candidate who has most highly distinguished himself in the examinations held during 1914. Also that Mr. Leslie Patrick Abercrombie, of the University, Liverpool, a candidate for the special examination, was awarded the Mark of Distinction for his Thesis on "The Development of the Plan and Architectural Character of three European Capitals—Paris, Vienna, and Brussels."

THE new Cambridge Street Council School, Newcastle-on-Tyne, one of the largest to be erected by the Education Committee of the City Council, was opened on Monday. The building is from the designs of Mr. J. H. Morton, F.R.I.B.A., which were placed first in competition. It is a three-storied building, accommodating 1,200 scholars, including infants, junior and senior mixed departments. In addition to these, a handicraft room for boys, and a domestic science room for girls, are enclosed in the main building. A novel feature is a roof playground, being the first to be erected in this city. The school has been designed so that practically every class-room has a sunny aspect and through ventilation. The contractors were Messrs. S. Sheriff & Sons, of South Shields.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addresed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than* 2 P.M. *on Thursdays.*

COMPETITIONS OPEN.

BRADFORD.—March 31.—The Corporation invite competitive designs for the re-planning of streets in the central area of the City of Bradford. Mr. Reginald Blomfield, R.A., will act as assessor. Particulars may be obtained on application to the undersigned, accompanied by a deposit of £1 1s., which will be returned on receipt of a *bonâ-fide* design. Mr. Frederick Stevens, Town Clerk, Town Hall, Bradford.

COVENTRY.—The City Council invite competitive plans for the erection of a public elementary school at Folly Lane, Coventry. The competition is strictly limited to architects practising in the City of Coventry. Particulars of the competition may be obtained on application at the Education Office, 44 Bayley Lane, Coventry.

LIVERPOOL.—Feb. 8.—The Corporation invite designs for workmen's dwellings, to accommodate about 500 persons, and proposed to be erected on the site known as the Rathbone Street area. Premiums of £100, £50 and £25 respectively are offered for the first three selected designs, and the Council have appointed Mr. Henry Hartley, F.R.I.B.A., as assessor. The first premiated design will become the property of the Corporation. A plan of site, together with a copy of the printed conditions and instructions, will be forwarded to the applicant on payment of a deposit of £1 1s., which will be returned on the receipt of a bona-fide set of drawings. Mr. E. R. Pickmere, town clerk, Municipal Offices, Liverpool.

MACCLESFIELD.—Jan. 31.—The Lands and Town Development Committee invite competitive plans, &c., for a housing scheme from the local architects and builders. Plans, specification, and estimate must be deposited not later than January 31, 1915, marked on the outside cover, "Housing Scheme." Mr. S. C. Baggott, Borough Surveyor, Macclesfield.

CONTRACTS OPEN.

The Old Way.

Otovacum—silent, rapid, thorough. The Otovacum Turbine Cleaner finds the dust and dirt wherever it is—surface dirt or dust deep down in the weave of the carpet.

The Otovacum Turbine

devours dirt and dust in a way that is marvellous—and never raises a dust. Every particle of dust is sucked into the collector—the instant it is touched. The most expensive and delicate stock can remain exposed whilst the Otovacum operates. So thorough is it that the air seems fresher and sweeter when the Otovacum has done its work.

HESWALL.—Jan. 25.—For a discharge block at the Pensby Convalescent Home, near Heswall, Cheshire, for the Wirral Joint Hospital Board. Messrs. J. H. Davies & Sons, architects, 14 Newgate Street, Chester.

HOLMES CHAPEL.—Feb. 4.—For erection of a proposed Council school at Holmes Chapel, Cheshire, for the Administrative Sub-Committee for Education for the Congleton Union area. Deposit £1 1s. Messrs. Alfred Price & Sons, architects, Sandbach.

IRELAND.—Jan. 26.—For erection of a tuberculosis dispensary in the grounds of the Louth County Infirmary, Dundalk, for the Tuberculosis Committee of Management of the Louth County Council. Mr. V. J. O'Connell, architect, Earl Street, Dundalk.

IRELAND.—Jan. 29.—For erecting a new school at Tierlahood. Rev. T. Clarke, P.P., V.F., Parochial House, Stradone.

IRELAND.—Jan. 30.—For building labourers' single and double cottages, and for fencing 70 plots, for the Gorey Rural District Council. Also to erect two concrete bridges as set out in the specification. Clerk of the Rural District Council, Gorey.

IRELAND.—Feb. 1.—For erection of thirty-six artisans' dwellings at Sallynoggin, Kingstown, for the Kingstown Urban District Council. Deposit £2 2s. (Messrs. Caldbeck & Dunlop, architects, 2 St. Andrew Street, Dublin.) Mr. J. S. Vaughan, town clerk, Town Hall, Kingstown.

IRELAND.—Feb. 1.—For erection of a central dispensary under the Tuberculosis Act (1908) on the grounds of the County Infirmary, Tullamore, for the King's County Hospital and Dispensaries Committee. The County Surveyor's Office, Court House, Tullamore.

LONDON.—Jan. 26.—For construction of an engine house, including the foundations for gas engines and pumps, the construction of culverts and connecting chambers, suction and delivery pipes, &c., and other works on the south side of the present engine house, at the Council's Isle of Dogs Pumping Station, situated on the east side of Stewart Street, in the borough of Poplar, for the London County Council. Deposit £5. The Council's Chief Engineer at the County Hall, Spring Gardens, S.W.

LONDON.—Jan. 28.—For alterations to the boiler house and builder's work in connection with a new heating installation at the Greenwich Infirmary, Vanbrugh Hill, East Greenwich, for the Guardians of Greenwich Union. Deposit £2. Mr. A. Roberts, F.R.I.B.A., 92 London Street, Greenwich.

LONDON.—Feb. 11.—For the repair and renewal of the iron and lead gutters, and also for the repair of the lanterns to the stable roof of the Council's depôt buildings, Stockwell Road and Combermere Road, Stockwell, for the Lambeth Borough Council. Mr. H. Edwards, C.E., borough engineer, Town Hall, Brixton Hill, S.W.

MANCHESTER.—Feb. 2.—For supply of an organ, seatings, pulpit, &c., for a new church at Styal, Handforth, near Manchester, for the South Manchester Board of Guardians. Deposit 10s. 6d. Mr. Fred. H. Overmann, F.M.S.A., 49 King Street, Manchester.

NUNEATON.—Jan. 27.—For erection of mortuary and public convenience in Queen's Road, for the Corporation. Deposit £1 1s. Mr. F. C. Cook, borough surveyor, Municipal Offices, Nuneaton.

PORTSMOUTH.—Feb. 4.—For carrying out of extensions to the infectious diseases hospital at Milton, comprising the addition of three new wings, a nurses' block, extension of laundry, mortuary, &c., for the Town Council. Deposit £3 3s. The Borough Engineer, Town Hall, Portsmouth.

RADCLIFFE.—Feb. 13.—For the construction and completion of sixteen dwelling-houses (in eight blocks of two each) on the Stand Lane site, for the Radcliffe Urban District Council. Deposit £2 2s. Mr. W. L. Rothwell, engineer and surveyor, Council Offices, Radcliffe.

ROCHDALE.—Jan. 27.—For erection and completion of repair shops in Mellor Street in the following trades, for the Tramways Committee: (*a*) reinforced concrete foundations and car platform; (*b*) steelwork (steel frame); (*c*) builders' work. Mr. P. W. Hathaway, A.R.I.B.A., Town Hall, Rochdale.

ST. HELENS.—Feb. 23.—For erection of a refuse destructor, together with all contingent works, at the Parr Depôt, within the borough. Deposit £2. Mr. A. W. Bradley, M.Inst.C.E., borough engineer, Town Hall, St. Helens.

SCOTLAND.—Jan. 26.—For mason, concrete, and brick work, carpenter and joiner work, plumber and slater work, steel and iron work, cement and rough casting, and painter work of buildings proposed to be erected at Greenhead Filters, for the Irvine and District Water Board. Deposit £1. Mr. H. Thomson, architect, Saltcoats.

SCOTLAND.—Jan. 27.—For the following work required in connection with the reconstruction and extension of Couper Institute, Cathcart, for the Glasgow Corporation—viz.: (1) Digger, mason, brick, and steel works; (2) carpenter, joiner, glazier, ironmonger, and iron-roofing works; (3) plumber work; (4) lath and plaster works; (5) slater work; and (6) tile work. The Office of Public Works, 64 Cochrane Street, Glasgow.

SCOTLAND.—Jan. 27.—For the mason, slater and joiner work of rebuilding the merchant's shop at Kirkton, Tonley, by Whitehouse. Messrs. Hunter & Gordon, advocates, 80 Union Street, Aberdeen.

SCOTLAND.—Jan. 28.—For the construction and erection at the new wharf, now under construction at the east side of Camperdown Dock, of two steel-framed sheds, covered with corrugated iron, one about 300 feet long by 180 feet wide, and the other about 240 feet long by 180 feet wide, for the Dundee Harbour Trustees. Mr. J. H. Thompson, M.Sc., M.I.C.E., general manager and engineer, Harbour Trust, Dundee.

SCOTLAND.—Jan. 30.—For executing the mason, carpenter, plumber, plasterer, asphalter, glazier, and slater works of alterations at Woodhead School, for the Fyvie School Board. Mr. W. Thomson, clerk to the Board, Fyvie, and Messrs. Kelly & Nicol, architects, 367 Union Street, Aberdeen.

SCOTLAND.—Feb. 2.—For extension of Coatbridge Post Office, for the Commissioners of H.M. Works and Public Buildings. Tenders are required for the whole work, and not for separate trades. Deposit £1 1s. The Clerk of Works, H.M. Office of Works, Head Post Office, Glasgow, and H.M. Office of Works, 3 Parliament Square, Edinburgh.

SEATON DELAVAL.—Jan. 28.—For erection of a police station, for the Northumberland Standing Joint Committee. Deposit £2. Mr. J. A. Bean, county surveyor, Moothall, Newcastle-on-Tyne.

SHEFFIELD.—Feb. 2.—For the supply of materials and works required in connection with the erection of a transformer sub-station in Carr Road, Walkley, Sheffield, for the Electric Supply Committee. Deposit £1 1s. Mr. S. E. Fedden, general manager and engineer, Commercial Street, Sheffield.

SOWERBY BRIDGE.—Jan. 29.—For the taking up and relaying concrete floor at the Tuel Lane Council School, for the West Riding Education Committee. Mr. F. J. Macdonald, Education Offices, Sowerby Bridge.

STOKE-ON-TRENT.—Feb. 25.—For the reconstruction of a portion of the roofing at the Hanley Baths, for the Corporation. The Borough Surveyor, Town Hall, Stoke-on-Trent.

TOTTENHAM.—Jan. 30.—For erection of a deaf school for eighty children and a mentally deficient school for 100 children on the Philip Lane site, for the Tottenham Education Committee. Send applications and £2 2s. deposit by Jan. 30 to Mr. G. E. T. Laurence, A.R.I.B.A., 22 Buckingham Street, Adelphi, W.C.

TRURO.—Jan. 28.—For the work in connection with the construction and erection of a new roof over the Council Chamber and adjoining rooms at the Municipal Buildings. Mr. F. A. Barnes, A.M.I.C.E., city engineer and surveyor, Municipal Buildings, Truro.

UPHOLLAND.—Jan. 30.—For erection of eight workmen's dwellings, for the Upholland Urban District Council. Deposit £1 1s. Mr. A. Hunt, surveyor, Council Offices, Upholland, Lancs.

WALES.—Jan. 23.—For erection and completion of a workmen's club and institute, Talbot Square, Aberavon. Send applications and £2 2s. deposit by January 23 to Mr. F. B. Smith, M.S.A., architect and surveyor, Port Talbot.

WALES.—Jan. 30.—For the conversion of Park House, The Quar, Merthyr Tydfil, into two cottages. Mr. T. E. Rees, M.S.A., architect, Bank Chambers, Merthyr Tydfil.

WALES.—Jan. 30.—For erection of boundary walls and fence walls at the Cemetery at Goitre, Port Talbot, for the Margam Urban District Council. Deposit £2 2s. Mr. J. Cox, surveyor, Port Talbot.

WALES.—Feb. 4.—For alterations to Cardiff Head Post Office, for the Commissioners of H. M. Works and Public Buildings. Deposit £1 1s. The Postmaster, Cardiff, and H.M. Office of Works, &c., Storey's Gate, S.W.

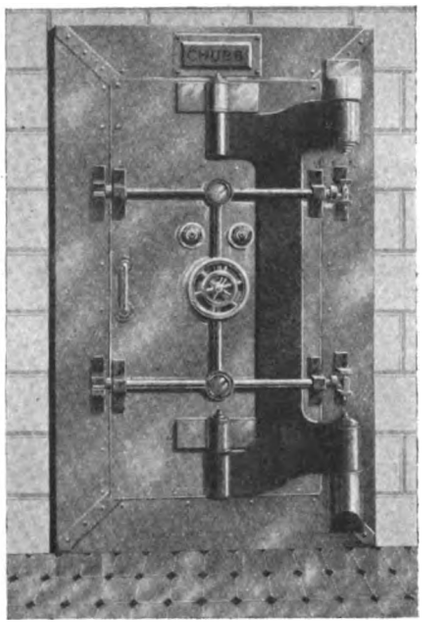
J. Hanson, Allerton, Bradford, painting	56	15	6



IRVINE and District Water Board have accepted the offer of Messrs. Wilson, Kinmond & Marr, Ltd., Glasgow, to lay a new main pipe from Munnoch reservoir to Greenhead filters at a cost of £3,539 14*s.* 6*d.* The Board recently decided to abandon the sandbed system of filtration, and it had been agreed to adopt the Paterson system of rapid filters. The Board accordingly accepted the quotation of the Paterson Engineering Co., Ltd., to provide the new installation at a cost of £13,175, together with an oil engine at £145.

THE annual meeting of the Midland Centre of the National Federation of Building Trades Employers was held at the Imperial Hotel, Birmingham, on the 14th inst. The President (Mr. George Gough, Wolverhampton) presided. According to the report, business had been satisfactory until the beginning of August; the war had had a prejudicial effect upon the industry, and contracts were suspended. The associations affiliated to the centre now numbered twenty-four, an increase of one, which was formed and federated at Stratford-on-Avon at the beginning of the year. The Birmingham figures showed a steady increase in the total membership—268 at the present time as compared with 205 at the close of 1911. Under normal conditions the annual conference of Midland Centre secretaries and a meeting of the Efficiency Committee would have been held early in the autumn with a view to inaugurating a "missionary" effort. In view of the conditions brought about by the war, however, the Executive Council had come to the conclusion that the present time was inopportune for attempting aggressive work. The report was approved, and the officers for 1915 were appointed as follows: Mr. Ralph Webb (Birmingham), President; Mr. Albert Brazier (Broomsgrove) and Mr. F. T. Doleman (Nottingham), Vice-Presidents; Mr. H. Willcock (Wolverhampton), Treasurer; and Mr. William Moffat (Birmingham) and Mr. Charles Garlick (Coventry), Auditors.

CHUBB'S TREASURY DOOR.

IT is eminently fitting that such a concern as Chubb & Son's Lock and Safe Company, Ltd., should have a habitat in London's Lombard Street—"a certain street of the greatest credit in Europe," as Addison describes it. For, as all the world knows, Lombard Street has for centuries been the resort of bankers, deriving its very name from the race of Italian bankers and pawnbrokers who settled there long ago and flourished amazingly. The name of "Chubb" is, of course, everywhere associated with the last word in the safe-keeping of money. Quite recently passers-by in that historic thoroughfare have been able to get a gratuitous view in the window of No. 45 of a Chubb's latest Treasury Door. Thereby they probably gained a more vivid idea of the wealth hidden behind the modest fronts in the immediate vicinity than they have ever had before. A door which, with its frame, weighs 6½ tons cannot fail to be imposing or to suggest the guardianship of fabulous wealth. It may also further suggest the scientific skill of the modern burglar, which has rendered such titanic strength necessary. An attack may be made in many different ways. The perfect treasury has to be capable of resistance to all. Thus we find in section this 8-inch door is built up of layers of five-ply drill-resisting steel, some inches of reinforced concrete, Chubb's special alloy, an anti-concussion spring diaphragm plate, and tough Siemens steel. Not until all

these have been separately negotiated is the lock and bolt chamber reached. The bolts are controlled by two keyless combination locks capable of some million variations. If desired, these locks may, in addition, be checked by the time lock, made with four independent chronometer movements, which prevents the door being opened before a given moment by anyone knowing the combinations on which the locks are set. Structurally a special feature is the crane hinge, by means of which the first movement in closing is a direct drive inwards, and as all edges of the door and frame are square, an air- and water-tight fit is thus permanently obtained. The extremely heavy cast-steel frame is built in one solid piece. These doors can be adapted for use with any strong-room, although in most instances they have been fitted to a Chubb's "Triple Treasury"—*i.e.*, two steel strong-rooms placed one within the other, and reinforced concrete packed between. It would really seem as if bankers could defy safe-breakers even when equipped with nitro-glycerine, the oxy-acetylene blowpipe, or any other aid.

THE Newport (Mon.) Elementary Education Committee recommend the provision of a school for physically and mentally defective children, which it is estimated would cost £10,000.

THE Sunderland Town Council decided at their last meeting to proceed with the Barnes Estate Secondary School for Boys scheme. An amended estimate showed that owing to the increase in the price of materials the cost of the scheme would be £40,290, or £3,101 more than the original estimate.

VARIETIES.

THE Hove Town Council have decided to insure the Town Hall against war risks damage for the sum of £20,000.

MR. JOSEPH TILT, of Mount Pleasant, Bromsgrove, retired builder and contractor, has left estate valued at £35,618, of which net personalty is sworn at £6,121.

THE Thames Conservancy have provisionally agreed to plans of a new bridge of reinforced concrete to be constructed across the river between Goring and Steatley. They have also passed plans for two proposed new bridges between Reading and Caversham.

AT Coventry last week a Coventry labourer failed in an application for compensation against Kelly & Son, builders. While applicant was working at Stoke a sweep knocked a chimney-pot off an adjoining house, and the pot fell on Hall and injured him. Judge Cann held that the injury did not arise out of the man's employment.

THE Conway and Colwyn Bay Joint Water Supply Board have under consideration plans prepared by their engineer for a girder bridge which it is proposed to erect over the Conway river at Dolgarrog. At present the 15-in. main to Colwyn Bay is laid under the bed of the river, and it is found to be liable to burst, causing interruption of the supply and great expense in renewal. The bridge will have its piers laid on strong concrete foundations resting on piles, and will give sufficient head room for navigation of the river steamers.

WE have received from the Great Central Railway Company a copy of the Immingham Tide Table for 1915. This neat booklet, which has been produced in pocket size, gives the high-water and low-water tides at Immingham for each day of the year, in addition to useful facts and figures, charges, steamship services, &c., respecting the ports of Immingham and Grimsby. Copies of the Tide Table will be sent free on application to Great Central Railway Publicity Office, 216 Marylebone Road, London, N.W.

MR. WALTER BUSBRIDGE, of Plumstead, who died on the 7th inst. at the age of seventy-four, was widely known and respected among men engaged in the building industries of London. Mr. Busbridge was one of the pioneers of local technical education, and started classes at Woolwich and Deptford as far back as 1866. In conjunction with Mr. T. Jones, he established at Woolwich the first class for the study of building construction to be opened in the London district. He gradually organised the group of classes known as the Metropolitan Drawing Classes. Many of the students trained under his direction obtained distinguished positions in this and other countries. The prizes awarded to his students by the Science and Art Department could be numbered in thousands.

TRADE NOTES.

UNDER the direction of Messrs. Mence & Finn, architects, 11 St. Peter's Street, St. Albans, Herts, the "Boyle" system of ventilation (natural), embracing Boyle's latest patent "Air-pump" ventilator and air inlets, has been applied to the new Board-room, St. Albans Union Workhouse, Herts.

MESSRS. E. H. SHORLAND & BROTHER, LTD., of Failsworth, Manchester, have recently carried out the following contracts: The Infectious Diseases Hospital, Cambridge, is being supplied with their warm-air ventilating patent Manchester stoves with descending smoke flues; the Hambledon Instituton (children's quarters) and the Berriew Council Schools are being supplied with Shorland's patent Manchester grates; the Barrow-in-Furness Infectious Diseases Hospital and the hospital at Bridgwater are being supplied with warm-air ventilating Manchester stoves; the Runcorn New Town's Depôt is being supplied with Shorland's exhaust roof ventilators.

NOT only the roofs of most buildings in these isles have been tested as to water-tightness by the recent heavy rains, but also the walls and cellars. A wall or cellar that has failed to keep a structure dry during this period can, we are assured, be made bone dry by adding the powder "Pudlo" to the cement used for concreting and rendering. The makers claim to have cured many such cases, and will be pleased to advise if full particulars are sent. We understand that for the Bilton Schools the powder "Pudlo" has been specified for impregnating the cement. The architects for the Staff Institute, belonging to Messrs. Swann & Hunter, of Wallsend-on-Tyne, are having the artificial stone work treated with "Pudlo." Apart from the waterproofing properties of the powder, it is reported to give artificial stone a bright and clean appearance, with sharp, clear cut arrises.

Concrete Institute: A Discussion on Report of the Science and Reinforced Concrete Practice Standing Committees, on "A Standard Specification for Reinforced Concrete," at 7.30 P.M.

THE TIMBER TRADE IN 1914.

To some extent the position of the timber trade is a criterion of the position of building, for if the consumption of timber is not wholly due to building, it is more intimately connected therewith than with any other industry, even than with mining or printing, which certainly come nearer than any others to building in their reliance on timber, and, with these, the importation of pit props and of wood pulp are so distinct that their participation in the timber trade does not vitiate any conclusions as to building that may be drawn.

The notable features most strongly affecting the timber trade during the past year, it is scarcely necessary to point out, have been the economic disputes in the building trade during the first part of the year and the influence of the war in the latter. At the beginning of the year the heavy stocks of soft wood in this country, the result of the largest import into the United Kingdom known for at least seven years, tended to reduce prices, and this tendency was accentuated by the building strike, so that imports and sales were below the average. From February onwards the building strike had a depressing effect on the markets, but buyers for consumption failed to get much benefit in reduced prices, owing to the continued firmness of shippers for the prices of the past year and the easier money rates, which enabled importers to hold their stock. The last four months of the year have been all in favour of importers, who, in consequence of the termination of the building strike and the resumption of work on contracts long held up, coupled with enormous Government orders, were able to unload large stocks at enhanced prices, uninfluenced by increased shipments, for shippers have had serious difficulties to contend with.

The import of soft woods during the past year has been 27 per cent. below that of the year before, an exceptionally heavy one in imports, and 18 per cent. of the preceding five years. Practically, say Messrs. Foy, Morgan and Co., in their annual wood report for 1914, the whole of the deficiency in comparison with the previous year is accounted for by the diminished shipments from Russia, the shortage amounting to about half-a-million standards, or 90 per cent. of the total decrease—a fact which will be readily understood when it is remembered that, since the outbreak of hostilities, no export has been possible from Petrograd, Riga, or the Gulf of Finland, whilst the shipments even from the Finnish ports in the Gulf of Bothnia have been greatly restricted. Scandinavia, on the whole, notwithstanding many difficulties and vexatious interruption of shipments, has maintained its position in regard to the volume of business done with this country.

The German proclamation in November making wood contraband caused a great deal of excitement in the timber market when its effect was realised, and led to an increase in prices which within a fortnight amounted to 30*s*. to 40*s*. a standard. It has been calculated that the shipments from Sweden on this account have been reduced by nearly 100,000 standards below the quantity which might otherwise have been expected. There can be no doubt, however, that stockholders in this country have been making unusually good profits, for during the last four months prices have risen even more rapidly than the cost of importing fresh goods, the increase on some sizes reaching £4 to £5 per standard. The increased cost of freight does not account for the whole of this, in spite of the scarcity of tonnage due to the commandeering of a large number of steamers by the Government and the total withdrawal of the German mercantile fleet. The increased cost of freight no doubt accounts for the failure of transatlantic shippers to take full advantage of the enhanced prices ruling in this country, with the result that shipments from transatlantic ports have during the year been 16 per cent. below the average of the five years 1906-1912.

Although high prices are likely to continue it does not appear that there will be anything approaching a famine in timber for the present, as a sufficiency of stock for winter requirements is assured, partly owing to the energetic action of the Russian Government in keeping the White Sea ports free of ice for some two months later than usual. The requirements of the Government for soft wood are not likely to be so considerable now that the accommodation for the new army has been practically all provided.

Turning now to hard woods, we find that the total quantity of mahogany imported into London during the last twelve months is about 5 per cent. less than the amount imported during 1913. The decrease is chiefly accounted for by the diminished quantities received from Africa and the absence of importations from Nicaragua. On the other hand, there have been increased supplies from Honduras and Mexico, while the figures relating to other sources of supply show no material change. Although imports have decreased, sales have been very much less, by over 2,000,000 cubic feet, and as a large stock was carried forward from 1913 the slackened demand has resulted in no public auction of mahogany being held since the outbreak of war in any part of the United Kingdom. The stagnation in the cabinet and

Digitized by Google

furniture trades has been the chief factor in this lessened demand.

Oak from overseas has been largely affected in supply by the war, German and Russian Baltic ports, as well as those of Austria, being quite unable to export. Yet we are somewhat surprised to note that, in spite of an increase during the last few months, largely owing to war requirements, the demand for American oak has been below the supply and is now at a low standard. Japanese oak, however—which, for building purposes, has for some time, often *sub rosa*, been taking the place of so-called Austrian oak—is taking an important place in the market, and considerable business in both logs and lumber has been transacted. The demand for oak is, of course, affected by the lessened requirements of the cabinet and furniture trade.

Teak has shown a change in the source of supply. From Moulmein the export of logs has practically ceased, nothing having arrived during the whole year. From Rangoon there has been a remarkable diminution, less than 500 loads having been received, as compared with 2,600 loads during the previous year. On the other hand, there has been a very large increase from Bangkok, the total quantity being more than double that of the previous year. The greater quantity of planks, however, still come from Rangoon. There is not much prospect of increased supplies of teak causing any material fall in prices; on the contrary, there is likely to be a steady maintenance of present prices during the early part of the coming year, with the possibility of a rising market later on.

There has been a decrease in the importations of Jarrah, the demand for paving sizes having practically ceased; but there has nevertheless been a good business in scantlings and special sizes, as well as in sleepers, and prices have been maintained. Kauri pine has increased in price, and owing to the special demands since the outbreak of war stocks are now quite small, so that lower prices are not to be expected.

The general outlook for timber, from the architect's and builder's point of view, is that of maintained or enhanced prices, particularly on account of the world's shortage of tonnage, which weighs heaviest on those more distant sources of supply that might otherwise have been in a good position to make up the deficiency of export from European countries caused by the war.

NOTES AND COMMENTS.

THE eagerness with which British traders are waking up to the possibilities of copying the German institution of the Leipzig Fair promises a boom in fairs in this country. Olympia, we are told, is to be the scene of a general fair, the British pottery and glass manufacturers' fair is proposed to be held at Stoke next month, and no doubt many more sectional fairs will follow. But have not the various trade exhibitions at the Agricultural Hall, Islington, and at other places in the Provinces had the opportunity of being Leipzig Fairs in reality? If they have not really filled the bill, it can only have been because their promoters have tried to attract the shillings of the general public and admitted side-shows to amuse them. A trade fair must be for traders alone. If it is a fair for a particular trade, it must be such that only members of that trade, real buyers and sellers, will attend. That principle has been the secret of the success of our recent Building Trade Exhibitions, and, in spite of the war, we are sorry to know that the biennial show which is due this year will not materialise. Architects are lacking work, and many are with the Colours. Orders would probably be few for the exhibitors, but the opportunity for education, to bear fruit in the future, would be great.

The restoration to Westminster Abbey of the sixteenth-century grille around the tomb of Lady Margaret Beaufort, mother of Henry VII., in the east end of the south aisle of Henry VII.'s chapel, has already received notice very generally in the daily Press; but the occasion is one so unhappily unique that, though necessarily belated, we feel it must be recorded in our columns. The grille is, considering its adventures, in a remarkably good state of preservation. At each of its angles and in the centre of the long sides is a rectangular pillar, with applied Gothic moulding, the upper part being twisted and surrounded by a finial, on which revolves a flag, originally painted. The sides are composed of vertical bars of lozenge section, supporting a horizontal band, with edges of twisted cable moulding, formerly ornamented with small appliques. On the upper edge is a line of fleurs-de-lis, alternately with pikeheads. Some verses by John Skelton, written on parchment and framed, formerly hung on it. The grille was taken from its position by the iconoclast Wyatt, the favourite restorer of Regency times. It was sold for a small sum, and remained in the family of the purchaser until recently bought by a London dealer, from whom the National Art Collections Fund acquired it. The grille seems to have been erected at the cost of St. John's College, Cambridge, Lady Margaret foundation, for the records of the college contain the specification, dated 1512, whose details correspond exactly with the grille as it now is.

It is not altogether a matter of regret that the pillagers of Belgium should have carried off to Germany many of the art treasures of the Netherlands, for they may thus be preserved from accidents that might occur in the stress of conflict, and their restoration can hardly escape being made one of the conditions of peace, for not only are they art treasures, but they are part of the capital that assisted Belgium in carrying on business as a tourist centre. From *Le Matin* we learn that the tryptich of the brothers Hubert and Jan Van Eyck—"The Adoration of the Lamb," of which the larger part was in the Church of Saint-Bavon, at Ghent, while two volets were in the Brussels Museum, and two in the Museum at Berlin—is now reconstituted in its entirety in the capital of the German Empire.

The pictures and miniatures of Hans Memling, which were a fortune to Bruges, in bringing each year to this town all the international colony of the artistic world to see them, have taken the same route.

The treasures of the Louvain Library, were they pillaged or burnt? Everything goes to support the belief that the treasures were carried off before the building was set on fire, and that the illuminated missals and the manuscripts, which were of inestimable value, formed part of the loads of the long string of automobile vans which on the day following the entry of the Prussians took the way for Germany.

From the Museum of Louvain has equally disappeared the picture of the Martyrdom of Saint Erasmus, by Dirck Bouts. The Berlin Museum had already possessed "The Last Supper," by the same painter.

The treasures of the cathedral of Reims, which included a large number of antique sacred vases, and the sacred Ampoule, which contained the holy oil with which the Kings of France used to be anointed, were saved and put in a place of safety before the entry of the Germans. It is believed that the same precaution was taken with "The Nativity," by Tintoretto; "The Apparition of the Christ to Mary Magdalene," by Titien; "Christ and the Angels," by Zucchero; and the "Crucifixion," by Germain.

Paragraphs having appeared in various journals conveying an erroneous idea as to further falls of masonry at Whitby Abbey, resulting from the bombardment of December, Mr. John Bilson, F.S.A., explains that no further falls have occurred subsequent to his report to the Society of Antiquaries, and thus states the facts: "The immediate effect of the bombardment on the west end of the nave and north aisle—the parts of the church

Digitized by Google

which have suffered most—was the destruction of the arch of the west doorway and the masonry above it, leaving a great gap in the west wall; a huge rent in the eastern side of the staircase behind the west respond pier; and some injury to the west window of the north aisle, and what remained of its tracery, and to the face of the buttress in line with this wall. These blows must have destroyed the slight cohesion of the disintegrated masonry, and serious falls occurred some ten days after the bombardment. The wall arcades on either side of the west doorway collapsed, the wrought masonry leaving the rubble core of the walls. The upper part of the newel staircase and its whole eastern half also collapsed, down to below the capitals of the respond pier, and brought down with it the north jamb of the great west window."

We are glad to know that the Royal Commission on Public Records is directing its attention to the security of certain public records under the present war conditions. We have not had to suffer losses from foreign invasion, and it is improbable that we shall do so, but we are now faced with the new perils of bombardment and aerial incendiarism, and it is to be hoped that the official custodians of public records in the threatened districts will make suitable provision for the preservation of national treasures which, unlike most other treasure, material or artistic, can never be replaced. There are many indications in the recent reports of the Royal Commission that the existing arrangements for the safety of outlying records are quite unsatisfactory, and when normal conditions once more prevail in the public departments the subject will invite their most careful attention. In the meantime there is a risk that in the stress of official activities during the war public records may be treated with scant respect, or may even be destroyed wholesale to make room for warlike stores. It is known that grievous losses have been sustained by the nation from such inconsiderate action during the Crimean War, and even as late as the South African War there was more than one holocaust of records which probably dated from the Restoration.

In an interesting lecture entitled "The History of the Building of a Great Mediæval Church," Mr. John Watson, F.R.I.B.A., took as his example the Church of Holyrood Abbey, which, though smaller in scale than many of its sister churches in England, was typical of a church of the first rank. The history of the building of the Abbey began in 1128, when a charter was granted by King David I. to Canons Regular of St. Augustine, established at St. Andrews. A second charter, confirming the grant and dated between the years 1143 and 1147, is preserved in the City Chambers. This charter described the church as being dedicated in the names of St. Mary, St. Andrew, and All Saints, and implied the existence on the site of a church older than that of the Abbey. In 1911 excavations carried out by H.M. Office of Works, under the supervision of Mr. Oldrieve, revealed the foundations of a Celtic church with a cemetery adjoining, showing the ground had already been consecrated to religious use ere the Canons took possession of the site—a common occurrence. The early church appeared to have been a single-chamber church, to which a square or semi-circular sanctuary was subsequently added. In building the Abbey, the conventual buildings were first erected, and the presbytery of the church apparently was proceeded with simultaneously. In Mr. Watson's opinion the foundations of the whole Norman church were laid contemporaneously, and later the walls of the nave were adjusted to these foundations. All that remained *in situ* of this church, which was not completed, is the east door from the nave to the cloister incorporated in the present building. In the first quarter of the thirteenth century a reconstruction, projected some years earlier by John, fifth Abbot, was proceeded with, and the ruins of this reconstruction and enlargement were the Abbey Church we know. On plan is comprised a nave of eight bays, north and south transepts, with eastern chapels in the aisles, a presbytery of four bays with lateral aisles, with a processional path between the high altar and the eastern termination of the building—the Lady Chapel; the aisles on the south side were double. This building took from the last quarter of the twelfth century until the late fourteenth or early fifteenth century to complete. Its internal length from east to west is 267 feet, length across transepts from north to south 134 feet, and width across presbytery and aisles 60 feet.

WAR ITEMS.

IN connection with the campaign undertaken by the Board of Trade on the advice of their Advisory Committee on Commercial Intelligence to assist British manufacturers and merchants to secure trade formerly in the hands of German or Austrian-Hungarian firms, the Board continue to receive a very large number of enquiries for the names of sellers or buyers of articles of which the sources of supply or market have been interfered with by the war.

Special arrangements have been made in the Commercial Intelligence Branch of the Board of Trade for dealing with these enquiries, and lists are prepared and circulated of articles which enquirers desire (*a*) to purchase and (*b*) to sell. The seventh list is now ready and may be obtained by United Kingdom manufacturers and traders, together with copies of the previous lists, on application to the Branch.

British firms interested in any of the goods mentioned, either as buyers or sellers, should communicate with the Director of the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C.

Amongst the articles which enquirers in the United Kingdom desire to purchase are asbestos slates, brick-making machinery, machinery for working marble and stone.

R.I.B.A. RECEPTION OF BELGIAN ARCHITECTS.

THE Royal Institute of British Architects has from the first opened its doors to the numerous Belgian architects who have sought asylum in this country from the reign of terror in their own. Certain privileges of membership have been accorded them, such as the use of the Institute's fine library and the right of attendance at its general meetings, and courtesies have been extended to them by individual members anxious to lessen the rigours of their exile. On Monday, January 25, a number of these gentlemen and their ladies were the guests of the Institute at a reception given in their honour at the R.I.B.A. in Conduit Street, Regent Street. The President, Mr. Ernest Newton, A.R.A., accompanied by Mrs. Newton, received the guests and warmly welcomed them on behalf of the Institute. The architects present included men eminent in their profession, some holding high official positions in Brussels, Antwerp, Liége, and other of the chief Belgian centres. The opportunity of meeting their colleagues under the hospitable roof of their British professional brethren was evidently much enjoyed and appreciated. On the walls of the reception rooms were displayed some of the treasures of the Institute collection, consisting of original drawings of the seventeenth-century Italian, French, and English masters, and the original water-colour drawings by James Stuart depicting views in Greece, afterwards reproduced in Stuart & Revett's famous work, "The Antiquities of Athens."

Among the Belgian guests present were: M. Adrian Blomme, M. et Mme. R. Vanverborght, M. et Mme. Alfred Portielje, M. Henri Carbon, M. Henri Blomme, M. et Mme. Brenta, M. et Mme. Geefs, M. et Mme. de Doncquers, Brussels; M. Georges Vellut, M. et Mme. J. Caluwaers, M. G. Van Oenen, M. F. Matthysseus, M. et Mme. Dhaeyer, M. et Mme. J. R. Vanhoenacker, M. et Mme. Auguste Verraert, M. Paul Lambotte (Director of the Fine Arts of Belgium) and Mme. Lambotte, M. L. Delbove, M. A.

Digitized by Google

Defever, M. J. Bytebier, M. et Mme. Louis Hendrikx, of Antwerp and Brussels; M. A. Dujardin, M. Georges Dieltiens, and M. F. Hemelsoet.

R.I.B.A. PROBLEMS IN DESIGN.

THE designs submitted under Subject XVIII. will be on view in the gallery of the R.I.B.A. next Monday, Tuesday, and Wednesday, February 1, 2, and 3 inclusive, between the hours of 10 A.M. and 8 P.M.

COMPETITION NEWS.

CONNAH'S QUAY.—The Urban District Council invite competitive designs for laying out about three acres of ground within their district and the erection thereon of working-class houses.

DUNDEE.—The School Board have agreed to the extension of the Harris Academy on the present site in preference to the more costly erection of a new Academy. The scheme, which is expected to cost about £26,500, will be the subject of an open competition.

ILLUSTRATIONS.

HOUSE AND STUDIO, KENSINGTON.

THE drawing of the house and studio erected at St. Mary Abbott's Place, Kensington, for W. Llewellyn, Esq., A.R.A., from the designs of Mr. Arthur G. Leighton, F.R.I.B.A., was exhibited at the Royal Academy last year.

S. BARTHOLOMEW'S, SMITHFIELD.

THE illustrations from St. Bartholomew's are reproduced from water-colour drawings by Mr. Chas. S. Carter, the holder in 1914 of "The Architect" Travelling Studentship.

BILLINGSGATE STREET SCHOOL, GREENWICH.

WE here illustrate a competitive design submitted by Mr. Philip A. Robson, A.R.I.B.A., for the elementary school which the London County Council propose to erect in Greenwich. Mr. Robson also sent in an unsuccessful design for the Battersea school competition. In his notes Mr. Robson says: The Greenwich school for 700 children (for senior mixed and combined junior mixed and infants) was an infinitely more difficult problem owing to a very awkward site, and, apparently, most architects gave it up, as only thirteen sets were received. The winning design was not unlike the one here illustrated, except that there is no direct through ventilation—a point made much of in the first premiated plans for the Battersea school and apparently ignored in the case of the Greenwich school. On these plans direct through ventilation is obtained on both floors—below by means of covered playgrounds and above by the usual arrangement of low corridors and windows over the corridor roofs direct into the classrooms. As the playground space is deficient (owing to the cramped site) roof playgrounds are arranged for both boys and girls, leaving the infants plenty of room on the ground. The cost was estimated at £14 6*s.* 8*d.* per head.

A COURSE of ten University Extension Lectures on "Cathedral Cities of Belgium and Northern France," to be delivered by Mr. Allen Walker on Mondays at 2.45, began on January 25, at the Central Y.M.C.A., Tottenham Court Road. The fee for the course is 10*s.*

MR. CHARLES CHEVERTON, architect, Devonport, has been instructed by the local Education Committee to prepare sketch plans of the new King Street schools, and also the arrangements for accommodating the children in Sunday schools.

THE Committee of the Georgian Society of Dublin having completed their notable record of famous Dublin houses in five volumes, and having discharged all their obligations in connection with the work, have found themselves in possession of a surplus sum of £41 15*s.* This sum has been sent as a contribution in aid of the Dublin Castle Red Cross Hospital.

ON February 12 two Royal Academicians will be elected in place of the late Mr. W. H. B. Davis and of Mr. Lionel P. Smythe, who has retired. Mr. Smythe was born in 1840, elected an Associate in 1898, and made a full member as recently as 1911.

THE ARCHITECTURAL ASSOCIATION.

AN ordinary general meeting of the Architectural Association was held on Monday, the 25th inst., at Tufton Street, S.W. Mr. H. Austen Hall, F.R.I.B.A., Acting President, occupied the chair.

Two ordinary members and one country member were elected. Mr. Philip E. Webb, A.R.I.B.A., who was nominated at the last ordinary general meeting, was elected to fill the vacancy on the present Council. The Council's nominations for the House List for the ensuing session were announced, beginning with the name of Mr. H. Austen Hall as President. These nominations will be formally made at the next general meeting, when it will be competent for any two members of the Association to make additional nominations for the House List.

Professor W. R. Lethaby, F.R.I.B.A., then read the following paper entitled

"MODERN GERMAN ARCHITECTURE AND WHAT WE MAY LEARN FROM IT."

I accepted the invitation of your committee to lecture on this subject too readily, although, as a matter of fact, I did so with great hesitation. The times are too tremendous for talk, and in serious times the expression of any views which are narrowly personal is a mere impertinence. In some, in many respects, we must be the most capable and gifted nation on the earth, and there is a form of patriotism which would rest content in pride of these things. There is, however, also an intenser patriotic pride which hates to fall short in any worthy power or skill, and which would add to what we certainly have all of value in which we fail. There is a patriotism which would have London even as Athens and Florence, and cannot rest until we "have built Jerusalem in England's green and pleasant land." There might be a patriotism so proud that it would disdain to assert its virtues and be content with the acclamations and reverence of other peoples.

My right to speak of German architecture and arts and crafts comes from my having visited the country about half a dozen times, and having seen many of the most important cities, including Berlin. It was many years ago that I came to the personal conclusion that Germany was racing; that she had consciously divided up human activities and knowledge into departments, and had definitely set herself to outrun all other competitors in all of them. The guardians and directors of the State had, it seemed to me, substituted for the old customary methods and detached competitions in arts and sciences a clear and definite purpose of beating down all rivals and surpassing all emulation. This is not far-fetched; it has simply been the result of bringing in the Prussian war spirit into every phase of life. German science, of which I can only speak concerning archæology, German industry, German architecture, have all been re-cast under the dominating desire to attack and to conquer. Think what this means if it is true—and something like it must be true—that at some time, forty or fifty years ago, the real leaders of the Prussian Power should have gathered together in some room and have decided to enter on such a definite campaign. German museums, German books, German machine industry and factories, the German theatre, and all the rest were to outclass the spontaneous productions of neighbour States. This being the end in view, all the necessary means were easy to see and to apply. The efforts of other peoples were studied, reported on, absorbed, and their mistakes in many cases rectified. For it has been an essential part of the position that Germany, coming into the field as an attacking party, was able to select and experiment in a way that was impossible for those who, in many cases, had been the pioneers. This conquering spirit certainly carries far; we do not know how far, but it must have its limitations—it will, I think, dry up the sources of originality. It seems to me, although there is a certain absurdity in uttering individual opinions on the psychology of a colossal Empire, that the Prussian spirit runs to extremes; even organisation may perhaps be over-organised, specialisation too specialised, and thoroughness be too thorough. Germany seems to tend to the unmeasured. Domesticity and feeding seem to an outsider to be done without measure—education and erudition are perhaps carried beyond due measure, and violence is certainly made violent beyond measure. They seem to have amended the Greek doctrine of the mean into "everything beyond measure." There is in them—and perhaps they cannot help it—a radical outrageousness.

In casting about for reasons for this I have sometimes

Digitized by Google

thought that one might be found in the fact that Northern Germany was never brought within the circle of ancient civilisation.

The most striking general characteristics of Germany to my mind are those of great size, of the number of cities which are obviously architectural and centres of learning, and of the dignity of the public services like the railways and trams. The size we cannot, of course, emulate, and we hardly perhaps realise the immensity of what by recent developments has practically become one Germany from the North Sea to the Adriatic, with a population nearly three times as large as ours. But the dignity of the cities and of the services must be acknowledged and praised.

I began by making notes of many points to speak on, but I shall limit myself to two.

The first thing in the arts which we should learn from Germany is how to appreciate English originality. Up to about twenty years ago there had been a very remarkable development of English art in all kinds. For five or six years, round about the year 1900, the German Government had attached to its Embassy in London an expert architect, Herr Muthesius, who became the historian (in German) of the English free architecture. All the architects who at that time did any building were investigated, sorted, tabulated, and, I must say, understood. Then, just as English free building had arrived, came a drear reaction and the re-emergence of the catalogued styles. It is equally true or far more true that the German advances in industrial design have been founded on the English arts and crafts. They saw the essence of our best essays in furniture, glass, textiles, printing, and all the rest, and, laying hold on them, coined them into money, while our Press, caught up into an eddy of devilish bright writing, set about to kill the whole thing. Just as we gave Germany many of the industrial ideas which she has so thoroughly exploited—the extracting of aniline dyes, for example. Just as she took up the arts and crafts experiments, which we employed critics to destroy at home. So we first seem to have arrived at the thought of an architecture which should develop in its own sphere, and not be for ever casting back to disguise itself in the skins which it had long ago sloughed off—or, like the dog of Scripture, eat its dinner twice over. (Even this image, however, is inadequate; the ideal seems to be that the architectural dog should for ever and ever re-swallow the same meal.) German architects have seized on this theory of a real architecture—or they have reached it for themselves. Meanwhile we have been caught up in one of our recurring reactions. Architecture is not seen as one of the forms in which the national energy, intellect, and spirit shall expand, but it is diverted and maimed and caged into formulas which are not only dead, but never had life.

The second thing which I wish we would earnestly compete in is PUBLIC WORKS. There are great things in a nation's life which cannot be estimated, and it is quite possible that for a dozen or fifteen years we have been living in the shadow of this terrible war and could do no other than we have done. But in our thought and in our effort as soon as may be we must set about public works everywhere and of every kind.

I take two instances from the newspapers of this month. We have had our recurring Thames Valley flood, which we get with surprise every eight or ten years. One morning my paper said that the fourteenth-century embankment of Chertsey was being watched with anxiety, and it was likely it would give way. Only a few years ago I went to Eton to see the discomfort of the school in another such flood. To anyone who travels it is a marvel how streams are guided and controlled and bridged—and we only need the "Happy Thought" that this may be, and shall be, the last Thames flood.

Now I give you a cutting from a recent paper: "Describing a visit paid by him five years ago to the Berlin Military Technical Academy, Sir George Greenhill said it was a magnificent institution, such as our rulers assured us we could not afford. The whole place, with its laboratories and other opportunities for the pursuit of peaceful science, was kept as smart and noble as one of our old colleges. There were plenty of outdoor artillery ranges close at hand for instructive work. Sixty officers were under instruction there for a course of three years, and their zeal was admirable. It was considered bad form not to give the best in return for the honour and glory of the Fatherland. It was a mournful contrast to revert to Woolwich, shabby and undisciplined, with the choice of a cellar under some stables or a kitchen and scullery and bare walls in a deserted hospital—there to organise victory at no expense. . . . We must put our trust in the junior ranks to push old Apathy from his stool and carry us through this war. . . . Our military science was under the rule of Thumb—the official genius whose fumbling method was considered a match for Disciplined Theory. 'Thumb' was hostile to 'Theory.' He scented a dangerous rival."

We must have magnificent institutions. There is not the least reason why we should not. They are paid for by taking money out of one pocket and putting it into the other, and the buildings then add to capital and plant. Expenditure of this sort is the only reasonable economy.

One thing the Germans have done is to organise a branch of orthodox and scientific political economy to deal with art and industries and the Arts and Crafts movement. I was visited last year by a man who had taken a doctor's degree with a thesis on this subject, who told me it was possible for him to obtain a university professorship as an expert in this branch. We must press the London School of Economics to consider this question and all the questions which have to do with quality in production. I have often asked, and am never answered, what are the conditions of public expenditure on fine streets and noble buildings in a city? How far is it desirable to have clean and organised cities, how far shabby and miserable ones?

I would here like to appeal to our architectural papers to consider for a time public works—not merely to chronicle them, but to ask for them, preach for them, and get them. The academic improvement of London is too apt to want to begin improving by pulling down some of the finest things we have, like the terrace in front of the National Gallery or the Nelson Column. On the other hand, it does splendid work in idealistic schemes of out-Haussmannising Haussmann. Still, we have no steady stream of opinion turned on everyday minor improvements, like the necessary putting in order of the underground stations which I travel by. And it would be such a welcome change to pictures of "Mr. A.'s" Billiard-room or "Mr. X.'s" Golf-cottage. Our great and noble architecture must be saved from being an adjunct of new-richness and week-ending.

A tremendous work has to be accomplished in England in improving all our villages and towns and the public services. Get into the habit of seeings things as they are, with the dirt, strewn paper, and orange peel thrown in; don't acquiesce, don't be content. It is our business to improve the organisation of public life as it is the doctor's to see to the public health. Go about saying Charing Cross Station must be put out of the way, and all the other stations improved; that advertisements must be kept in order, and the streets made clean. In your own work I would urge you to confidence and to go ahead. Throw away the hesitating carping spirit, venture on liking things; reserve criticism in the main for critics, and back up all active efforts. As much as lieth in you work with other men and other groups. Such association is an enormous gain of power. I see in our isolation the root of much of our artistic trouble. We are too apt to feel of another chap, "Oh, he's the fool that thinks I am a fool."

Now at the end I must try to make a confusing distinction. I have found that when modern German effort in city-building is praised, people ask me, "But do you like it?" It is a difficult question. Remember how little we really like before asking me if I like the hardness, glare, and brutality of modern Hanover, Strassburg, Magdeburg, or Cologne. They were not built for me to like, they were built for themselves. Besides, do I like modern Paris or London? Well, I don't. I do, however, greatly admire the wonderful efficiency and ambition of the Germans in city organisation.

[The lecture concluded with a series of examples of modern German work, such as bridges, shops, stores, offices, stations, and monuments.]

DISCUSSION.

Sir T. G. Jackson, Bart., R.A., in proposing a vote of thanks, said that when he first heard that the title of the paper was to be "What Architects may learn from the Enemy" he wondered whether this country was at the present moment far enough removed from the Germans to learn anything from them. Undoubtedly many things Germany does better than we do, such as her attack on Scarborough or her method of conducting warfare. But he did not know that we had much to learn in the way of patriotism. We are patriotic in a very different way to Germany; our patriotism consists in doing the best we can for our country; we do not vaunt it as being better than that of any other

Digitized by Google

country. German patriotism was different. They love their country and admire it so well that they wish to include in it every other country, whether willing or unwilling. German culture was to be impressed on the whole of Europe: even our language and our arts were to become German. That principle was not true patriotism. For patriotism was love of your own country. The character of German art in the past had been, in the speaker's opinion, overrated by the Germans themselves. In the distant past their art has been borrowed from other people, though they have shown aptitude to learn. Their Romanesque was taken from Lombardy and their Gothic from France. They have never been distinguished for originality. Their pretension to superiority in scientific achievements has been disputed. Their inventions have been rather behindhand. Their great *forte* has been to exploit the inventions of other people. Aniline dyes were the discovery of an Englishman; wireless telegraphy was probably invented by an Englishman and carried to perfection by an Italian. The Germans possess an extraordinary faculty for diligently working up and adding to whatever they take up. They were distinguished in the past more as archæologists than as architects, though the German architecture of to-day is not altogether to be neglected. They have an extraordinary aptitude for order which is carried into every department of life. For example, if on a railway journey a dispute arises as to whether the carriage window should be open or shut, the matter is put to the vote, and should the votes be equal the guard is called in to decide. Such a thing is foreign to our English character. We have always been a people of individual tendencies, with an inborn distrust for everything the Government does. All our great movements in the past have risen from private enterprise. Our great public works have never come about till forced upon the authorities; they have always originated in private effort. Our public schools and universities are independent bodies instead of being run by the Government. Whether it would be a good thing for England to copy Germany he did not pretend to say, though, speaking for himself, he was an individualist. He must say that he had been agreeably surprised by the appearance of the works thrown upon the screen. All that was just shown was, of course, in its main motives engineer's work. This latter fact emphasised the truth that at the bottom of all good design lies good construction, and that no definite lines can be drawn between architecture and construction.

Mr. Martin Shaw Briggs, in seconding the vote of thanks, said Professor Lethaby had been brave enough to give the devil his due—a remarkable thing to do. One could not imagine any German professor giving a lecture at the present time in Germany on anything which could be learnt from England. Just before the war he had been in Germany studying their continuation school buildings, such as Lord Haldane would like to establish over here, and this involved a type of design which had been left alone by us. As a result of that study he would like to add his testimony to what Professor Lethaby had said as to two or three of the most valuable aspects of German architecture. There were various types of building from which he honestly believed we in this country could learn. Their railway stations had struck him tremendously, most of all that at Carlsruhe. Then came the commercial buildings and stores. Mr. March Phillips would probably see in these the realisation of all he had been preaching—*i.e.*, the beginning of a modern architecture. The German bridges alone are very wonderful. In one town the authorities preserve models of every public building of importance. In his study of the schools he was struck by two points where we could learn. First was the wonderful facility with which the Germans use modern materials, including plaster, concrete, and steel. Then there was the wonderful vigour displayed. Their use of plaster alone offers a wide field for study. The Germans understand colour and use it to perfection in their municipal buildings. As to other phases of German character, he might say there was hardly a backwater of knowledge where, if there is no other book on the subject, there is not a German work which proves to be thorough and containing just what one wants to know. He hoped the world was now seeing the unreal aspect of Germany and that that country would come back and apply their wonderful efficiency to other directions.

Mr. C. C. Brewer remarked it must have been a real struggle for anyone, and especially anyone of Professor Lethaby's temperament, to stand up and say what he had said about our enemy. Towards the end of his lecture Professor Lethaby had said that for the future one of the lessons we in this country had got to learn was to work together. That was the secret of their success. It did not mean abusing the other side. Sir T. G. Jackson a short time ago wrote a letter to the *Times* on German architecture. Much of what he had there told them they would agree with. But when he turned to modern work he gave the impression that the best that modern German work was capable of was seen in "the monstrous spires of Cologne Cathedral and the national memorial which disfigures Coblentz." But, judged by such standards, we of this country stand no less condemned. Witness the north transept of Westminster Abbey as to the first kind of work. Then, after all, the Coblentz memorial was saying something; but, he would ask, have our memorials said anything? Do the memorials in front of the Albert Hall and Buckingham Palace say anything that is national? Germany was doing the right thing. Even though the national spirit of Germany was bad, Germany was right in putting it into her monuments. In our own memorials there is nothing but the lesson of the antique shop, the lesson of Wardour Street. Professor Lethaby's paper was full of fine things. Personally he (Mr. Brewer) hated everything German and hated German architecture. Shortly before the war broke out he had been in North Germany, and there he had felt that, though there was stuff one might not like, at least it showed character, and national character. If it seems horrible and you dislike it, then you will dislike the German character.

Sir T. G. Jackson said that in his letter just referred to by Mr. Brewer he had gone so far as to call the memorial at Coblentz hideous; it did seem to him a brutal piece of architecture. If that work represented German character, then the Germans were right in putting it up. Nor could he consider the two monstrous spires added to Cologne Cathedral as beautiful. They seem to crush the cathedral, while the natives tell with pride how the spires are as high as the cathedral is long and how each finial is 15 feet across—that is, 15 feet too broad, for they have a spoiling effect by their very size. In fact, the whole cathedral is spoilt by this national megalomania. The same tendency is seen in their mediæval Gothic work. They continued the double aisles which the French gave up, and in at least one church the east end is so smothered in unnecessary flying buttresses that the apse is hardly visible. Nor could they make their long windows long enough. As one goes south the standard of architecture improves.

Mr. H. H. Statham did not think that modern German architecture had been quite done justice to by the photographs just shown to them. His own opinion was, nevertheless, that the Germans were essentially an inartistic people. But he was interested by their street architecture, some of which was more pleasing than any they had seen that night. He did, however, admire the bridges shown upon the screen, for they were such excellent engineering. He could not quite agree with Professor Lethaby's praise of their ironwork. Indeed, he thought the whole supremacy of Germany was very much overrated. It was a remarkable fact that of the only two great German poets, Goethe was one of the most unGerman men who ever lived and Heine hated the Germans. We of this country need not fear very much that they were our superiors in the arts. He was not quite sure that he had the same horror of intellectual architecture as Professor Lethaby had. To throw away tradition would in his opinion be a great loss.

Mr. W. Curtis Green contributed the following written communication: It is surely one of the ironies of fate that a nation that has at will produced the most universal chaos in the history of the world should be the people who have apparently made the greatest advance in transforming the chaos of the arts and industries into something approaching order. It is remarkable that a nation who in all its history has, so far as I know, never produced any first-class work or art, who has never shown much appreciation of the refinements of beauty or of nature, who has no originality, who as I understand it are without faith—having only one of the attributes of faith, that is courage—should yet have so many lessons to teach us. Here it is necessary to consider to whom those lessons are addressed. Are they to us as architects or as citizens? Are we to go to them as the fount of inspiration for the arts? Or for a model in co-operation and organised building? I think for the last. The appeal of their work is to order and discipline; these are qualities to inspire respect, but they are not the stuff out of which beauty is made; beauty is of the spirit. It is remarkable that Mr. Lethaby, with his wide outlook, his appreciation

Digitized by Google

of the elements of essential beauty, should look to the reconstruction of the art in the study of the commonplace, and, if I understand him aright, to the sacrifice of individual search for perfection to the plane of a common and even vulgar lust of disciplined effort. In the attitude of commerce towards art and science there is much to be learned from the enemy. As architects we have nothing to learn from them that we cannot learn better from some of our fellow-architects, from Mr. Lethaby himself, here at home. New work of theirs that I have seen has that pleasing and deceitful touch of strangeness, that slightly foreign air, that is apt to confuse the student, because every great work of art has a touch of strangeness, but it is a strangeness foreign to the German atmosphere. The truth is that we are beginning to study architecture in the right way, that is to say, we are learning not only from the past but from each other; the Germans, who have always shown an adaptability to the ideas of other nations, a talent possessed also by ourselves, are copying us. For every pleasing illustration of their work we can show a better. What our work lacks is the cohesion given to it by the combination of the building arts with commerce and municipal enterprise. The future may hold a wider and better co-operation between industry and art and nation and nation. That is surely the tendency of modern movement.

Mr. H. Austen Hall, in closing the discussion, said while in Germany a few years ago he went to see the exhibition of competitive designs for a Bismarck memorial. The drawings were simply marvellous. Nearly every design showed a colossal figure. Yet the selected design was entirely different from all those, for it showed a symbolic figure of Siegfrid, while scenes from Bismarck's life were portrayed in panels. It struck him at the time that the bulk of the designs represented the bulk of the national feeling. But the fact of the selected design lacking all the brutality and horror of the others suggested that the Germans might really be getting tired of those characteristics. Perhaps in this war the German people are trying their last fling, their hitherto untried new engine of war has been thrown in. But after the war he believed that the German mind which selected that symbolical design—which imagination alone could give a meaning to—would become supreme; that they would in the future give up the Juggernaut business.

A vote of thanks was then carried by acclamation.

THE DIVISION OF THE AMBONE IN ROME.

By J. TAVENOR PERRY.

THE raid of Robert Guiscard on Rome in May 1084 synchronised with, if, indeed, it was not the initiating cause of, an alteration in the arrangements of the ambone and the ritual in connection with it. When he burst in at the Flaminian Gate, and had rescued the Pope from St. Angelo, he marched across the Campus Martius, through the Via Lata, and passing by the Imperial Fora, went as directly to the Lateran as the circumstances would permit, doing comparatively little damage to the city. The citizens, however, three days later attacked him, and he in retaliation laid waste the district round the Lateran, destroying the churches on the Caelian, and among them San Clemente and SS. Quattro Coronati; and it was in the subsequent rebuilding of the former of these churches that the first departure from the older ritual arrangement of the ambone was made.

We know that the injury inflicted on San Clemente on this occasion fell short of entire destruction, since much of the screenwork and wall decoration of the old and now subterranean church has survived. It had a presbytery and choir arranged much as at present, but without the ambones, and was similar in this respect to the ancient basilica of S. Petronella on the Via Ardeatea, excavated in 1873. The ancient screens enclosing the choir may have belonged to the time of Pope John VIII. (872-882), as his monogram appears on some of the slabs reused in the upper church; but parts may have been much older, as there is a portion of an altar among the reused fragments bearing the name of Pope Hormisdas, who reigned from 514 to 523. It is very clear, however, that there was no ambone connected with this screenwork in the original church, but that this must, as in the case of S. Petronella, have stood out in the nave before the doorway to the choir in the ancient manner. The screenwork was brought up from the lower church by Cardinal Anastasius in 1108 and arranged as we now see it, the old material being pieced out with new, and this date is fixed by the inscription on the episcopal chair which runs thus: "Anastasius Presbyter Cardinalis hujus tituli hoc opus cepit et perfecit." Whether the ambones were added at the same time or at some slightly subsequent period cannot now be determined, but that they were insertions is evident on the most cursory examination, as the panels of the screens have had to be cut and altered to make room for them, and they themselves are partly constructed of old screenwork or of an earlier ambone which has otherwise disappeared. We give a plan of the Schola Cantorum of San Clemente in its present state (Fig. 1), together with a sketch of the ambones (Fig. 2).

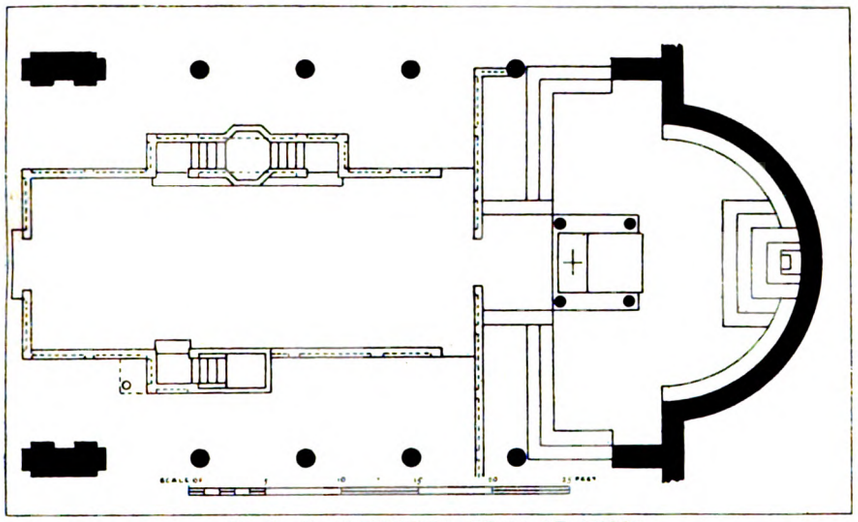

FIG. 1.—S. CLEMENTE.—PLAN OF CHOIR.

The erection of these double ambones in San Clemente not only marked an important change in church arrangement, and a modification of the ritual in regard to the Gospel reading, but it synchronised with another addition to the architectural appearance of this feature in the Paschal candlestick, which in future became associated in Rome and Southern Italy with the ambone devoted mainly to the Gospel reading and always now known as the Gospel ambone. From this time onward, where the size of the church allowed and other circumstances permitted, two ambones were erected as a rule; and if only one was set up, as frequently occurs in North Italy, it was no longer a central feature in the nave, but was relegated to one side or the other according to the position in which local custom required the Gospel to be read. But this alteration seems at the same time to have inaugurated an era of great activity in ambone building throughout Italy, and some of the most beautiful examples, rich in sculpture and mosaic, were erected during the following two centuries; at the same time in the rest of Europe and in the East, except in the Coptic churches, none appear to have been set up after the middle of the thirteenth century.

The change in the position of the ambone from the centre to the side of the nave necessitated some corresponding

Digitized by Google

alteration in the details of the ceremonial which took place at the reading of the Gospel. When occupying a central position it is evident that the reader must have faced towards the west and the congregation, the book of the Gospels being held by the sub-deacon standing at the head of the descending steps; but when the ambone was shifted to the side the reader would naturally turn towards that side of the church on which the congregation was placed and rest the book on a desk or on the parapet. It is to be remembered that in early times the men were entirely separated from the women in church, and that the words of the Gospel were mainly addressed to them as the chief object of the Church's teaching, so that from them, as St. Paul requires, the women were to learn at home. It is necessary to quote the exact words of the Ordo Romanus on the subject since, for in spite of the very definite instructions it gives as to the position of the Gospel reader, a large proportion of Gospel ambones were so placed as to render these instructions impossible of fulfilment; and amongst these must be included many of the most important in North Italy; while of the three Gospel ambones still remaining in their original positions in Rome, San Clemente, S. Lorenzo, and Sta. Maria in Cosmedin, in only the last two can these instructions be complied with, and it is impossible to imagine a difference in local usage in placing the men of the congregation in three neighbouring churches in one city. The direction runs: "Evangelium lecturus stabat versus meridiem ad quam partem solent viri confluere. Cum enim antiquitus in Ecclesia pro viris et mulieribus essent loca distincta, Diaconus faciem vertebat ad partem virorum, qui in aliquibus Ecclesiis in meridionali, in aliis vero septentrionali parte stabant, et eum melius audire, tuasque domi uxores et liberos de Christi dictis et factis, prout Apostolus monet, instruere possent."

While central and single ambones only were in use no fixed desks for holding a book were provided, or, indeed, were practicable, since the reader, whether he turned to the altar on the one side or towards the congregation on the other, faced down or over an open flight of stairs, so that he must either have held the book himself or it must have been held for him by a sub-deacon standing at a lower level. When, however, the readings which had been confined to one ambone were divided between two, different arrangements had to be made and desks were immediately introduced, and the earliest we can give is that of San Clemente. In Rome no difference was made in the plan of the Gospel ambones, but only in their position, from what was already in vogue, and as no desk was added to the parapet on the side on which the deacon might have been expected to stand whilst reading, it is quite possible that the ancient practice of standing at the top of the steps and facing westwards while reading was continued for a little time after the introduction of the double ambones. A slight addition was made, however, in the case of S. Lorenzo, where a sculptured eagle was placed below the position occupied by the desk later on. But the smaller ambone from which the Epistle was read seems from the first to have been provided with a desk; indeed, in San Clemente there are two, the larger one towards the east to hold the book of the Epistles, and the smaller one towards the west, at the foot of the stairs, to hold the Psalter from which was chanted the Gradual.

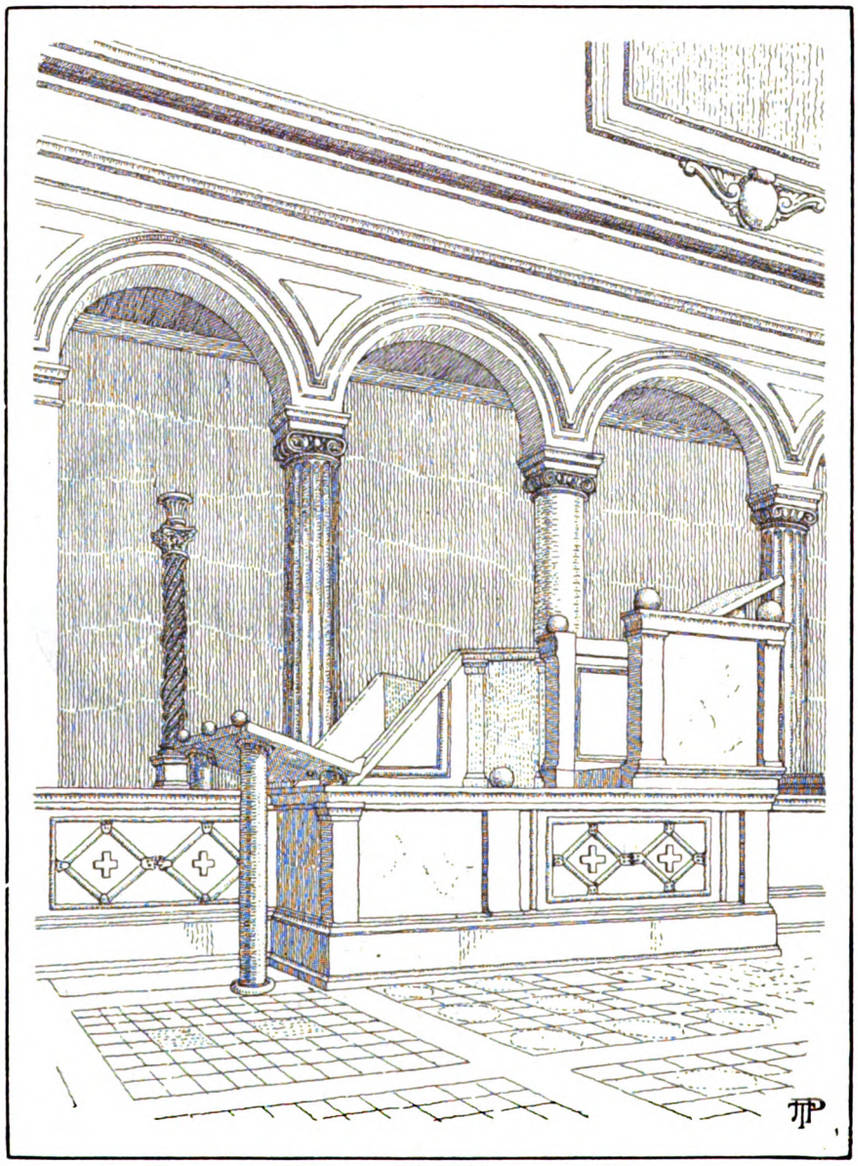

FIG. 2.—S. CLEMENTE.—EPISTLE AMBONE.

These desks developed by degrees into ornamental accessories, and in all Gospel ambones, or where one ambone served for all purposes, the Gospel desk was almost invariably supported on an eagle symbolic of St. John the Evangelist, and sometimes the other Evangelistic symbols were associated with it, the whole forming an important

Digitized by Google

group of sculpture. And it must be noted that where a single side ambone served for all purposes a subsidiary desk was provided, sometimes on another face, and sometimes at an angle, for the book of the Epistles, so as to keep the Gospel desk solely for its more sacred purpose.

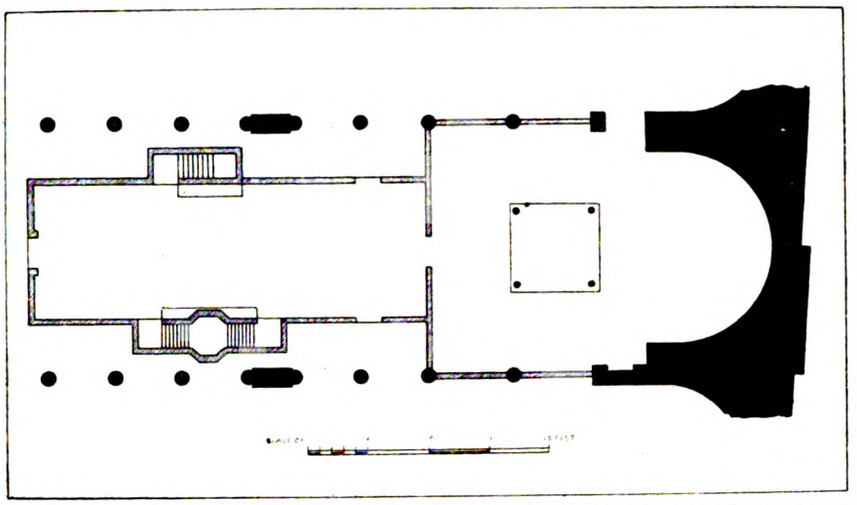

FIG. 3.—STA. MARIA IN COSMEDIN.—PLAN OF THE CANCELLI BEFORE DESTRUCTION.

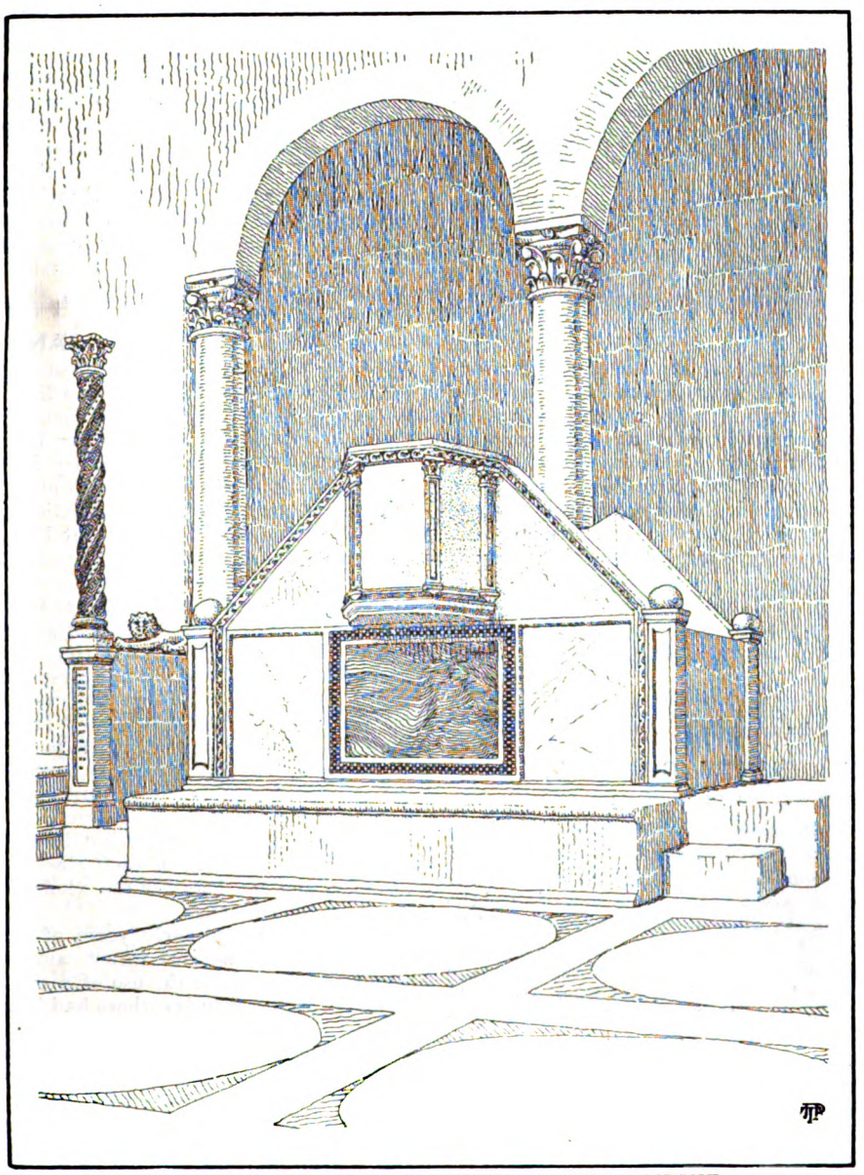

FIG. 4.—STA. MARIA IN COSMEDIN.—GOSPEL AMBONE.

Another important function fulfilled by the Gospel ambone, to which we have already referred, was the ceremony of the consecration of the Paschal candle on Easter Eve, which led to the association of a permanent marble candlestick with the ambone in Rome and many parts of Italy; but it must be remembered that this association was purely local, and that the Paschal candlesticks elsewhere were made of metal and so far movable that, as they were only required to be in use for six weeks, they could be taken down and put away when not wanted. As the candles were of very great size, such as the one made for Canterbury in 1457, which weighed 300 lb., the candlesticks had to be proportionately large; and the great bronze Paschal candlestick of Durham, which was put up and taken down each year, rose so high that the candle had to be lighted from a hole in the vaulting, and its branches spread out to nearly the width of the choir. The Italian examples, being

Digitized by Google

of marble, sculptured or inlaid with mosaic, were of more modest dimensions, and were frequently subsidiary to the ambone itself, although at times they stood independently in front of it; and in several cases where the ambone has been destroyed the candlestick has been fortunately preserved, as in St. Paul-beyond-the-Walls, Rome, and the Duomo, Gaeta.

The ceremonies attendant on the consecration of the candle must be described. The fire for lighting it was obtained on Maundy Thursday from a flint struck outside the church door, from which a lamp was kindled and kept burning until Easter Eve, when the Paschal candle, which was blessed that day, was lighted from it. On Holy Saturday a hymn in praise of the candle, named the Præconium in the Missal, but more generally called the "Exultet," was sung in the ambone by a deacon vested in a white dalmatic, with other clergy in purple. The hymn and its music were written on long strips of parchment, known as "Exultet rolls," which were frequently very richly illuminated, and often contained contemporary portraits of emperors, Popes, and benefactors to the Church, making those which have been preserved of the greatest value. The whole ceremonial was beautiful in the extreme, for the lighting of the candle was followed by the lighting of all the lamps and candles in the church, which had been extinguished since Matins.

We have already described what happened on the reconstruction of the choir of San Clemente early in the twelfth century, and we must repeat that the positions then given to the Gospel and Epistle ambones were not adopted as a precedent, as contrary to the instructions of the "Ordo," but that, as far as we know, in all subsequent erections in Rome the Gospel ambone was placed to the right-hand side of the nave—that is to say, on the ritual south side—and the Epistle ambone to the left-hand side, looking towards the altar.

Perhaps the first pair of ambones to be erected in Rome subsequent to those of San Clemente were in Sta. Maria in Cosmedin, and although they still stand in the position in which they were first placed, the screens surrounding the Schola Cantorum, to which they were attached, have been removed, leaving as the only indication of its extent the raised platform which formed its floor (Fig. 3). These ambones are constructed entirely of Pavonezza marble, that for the Gospel being relieved by a fine slab of porphyry let into the front and surrounded by a band of mosaic (Fig. 4). The pulpit, which projects on both sides, as in the old central ambones, is without any desk. The Paschal candlestick standing on the parapet at the foot of the eastern staircase has a spiral shaft decorated with mosaics of the type which became common in Rome under the Cosimati, and has its base grasped between the paws of a couchant lion. In a panel of its supporting pier is an inscription which shows that its maker bore the appropriate name of Paschal. Supplying the elisions it runs: "Vir probus et doctus Paschalis rite vocatus summo cum studio condidit hunc cereum."

(To be concluded.)

LONDON COUNTY COUNCIL.

CRANE DERRICKS IN LONDON.

ARISING out of the recent crane accident on the site of the new London County Hall, which resulted in the death of one of the contractor's employees and serious injury to another, the question was raised at this week's meeting of the London County Council as to whether or not powers could be obtained for the control of crane derricks in the Metropolis.

Mr. J. D. Gilbert asked the Chairman of the Building Acts Committee whether his attention had been drawn to the comment of the Coroner at the inquest that "there was no control of these cranes in London, while in Scotland there was control." If the statement were correct, and considering the great increase in the number of such cranes on London building jobs, would the Committee consider the advisability of recommending the Council to apply for powers to regulate the erection of cranes in London in the interests of public safety?

Mr. Kingsley Wood (Chairman of the Committee) admitted cognisance of the Coroner's remarks and the jury's rider to their verdict, that all such structures should be erected and maintained under Government supervision, with frequent inspection. The Council, however, had no power beyond that contained in Part 9 of the London Building Act, 1894, which only enabled the Council to take action if such structures were known to be in a dangerous state. The Council in 1905 framed a Bill endeavouring to obtain power of control, but had to abandon the proposal owing to opposition. Bills dealing with the subject were introduced by the Government in 1908 and 1909, but those Bills were also opposed and withdrawn. The Committee was again considering the question of seeking power.

In consequence of the Coroner's observations, inquiries had been made by the Council's superintending architect from the Master of Works in Glasgow, and the statement that in Scotland there existed an official known as the Dean of Guild, who was appointed to supervise the erection of these cranes, was not corroborated.

WORKING-CLASS DWELLINGS.

An interesting sidelight was thrown on the contention, which has frequently been urged in all manner of deliberative and professional assemblies of the building world, that under existing conditions it is impossible for builders, speculative or otherwise, to erect workmen's dwellings at a profit. Speaking on a proposal presented by the Housing of the Working Classes Committee to proceed with the erection of working-class dwellings on the cleared Tabard Street site, Mr. Bernard Holland (Chairman of the Committee) said that, owing to increasing expenses and the fact that wages showed an upward tendency, it seemed very difficult indeed for the Council to build anything which would pay its way. In the case of voluntary work, they could avoid the difficulty by buying no new estates, but in cases of statutory obligation to build it became more and more difficult to meet the position on the basis of the principle laid down by the Progressive Party years ago, when labour was not so dear, and other conditions were not so irksome.

Mr. Bernard Holland's remarks constitute, in effect, official confirmation of the evidence given recently before the Scottish Housing Commission, that the erection of workmen's dwellings by private enterprise had virtually ceased, and that even local authorities were experiencing the greatest difficulty in initiating housing schemes on lines which would prove financially successful.

CONCRETE IN SANITATION.*

CONCRETE has played its part in sanitation for many years, with more or less success, according to the skill of the designer and the quality of the materials and workmanship. The tendency in recent years has been to employ concrete more and more, and this tendency in the future is sure to extend its use in directions where now it is scarcely applied. Sanitation works have been particularly affected by the attitude of the Local Government Board towards reinforced concrete, as such works are generally undertaken by local authorities, who have to obtain the sanction of the Board to the raising of a loan for the amount of capital expenditure, or else to obtain Parliamentary powers by means of a private Act. The great majority of authorities, however, adopt the first of these two courses of procedure, and the practice of the Board is, in the case of reinforced concrete for works in contact with water or sewage, to require the capital sum to be paid off in a period of ten years, while in the case of ordinary concrete, under the same conditions, the period of repayment is thirty years. In cases where, in addition to reinforced concrete in contact with water, there is reinforced concrete not in contact with water, the periods for the loans on each class are sometimes equated together, and the loan for the whole granted for the period given by the equation.

Doubtless in the early years of reinforced concrete the Board were well advised to act cautiously in the matter of sanctioning loans for the use of a combination of materials of which, in this country, there had been scarcely any experience, either as to its suitability or as to its life in sanitation works. The effect of this differentiation on the part of the Board in the treatment of concrete, and of reinforced concrete, has been to curtail the employment of the latter in public works of sanitation. It is clear that under the present conditions, where the loan is obtained for reinforced concrete, the burden thrown on the ratepayers annually to repay the principal and interest in equal annual instalments spread over ten years would be more than twice as great as for a loan of equal amount and ratio of interest obtained for ordinary concrete, to be repaid in equal annual

* **Abstract of Paper entitled "The Application of Concrete in Modern Sanitation" by Mr. Henry J. Tingle, M.Inst.C.E., read at a meeting of the Concrete Institute.**

Digitized by Google

instalments in thirty years. The following example will illustrate the matter. If £1,000 be borrowed at 3¾ per cent. interest, to be repaid in equal half-yearly instalments of principal and interest for a term of ten years, the amount to be paid each half-year would be £60 8*s.* 6*d.*; for thirty years, £27 18*s.* 1*d.*

The difference between these two amounts is approximately £32 10*s.*, which is 116 per cent. of £28.

Under these circumstances it is only natural that most authorities elect to use ordinary concrete in order to ease the burden on the present ratepayers and throw part of it upon the ratepayers of the future.

The effect of the differentiation amounts to this—that unless the cost of the works can be considerably reduced by the employment of reinforced concrete as compared to ordinary concrete, there is but little probability of local authorities deciding in favour of the former. The requisite saving may be effected in some instances, but so far as the experience of the author goes this is not generally the case.

With the experience that has now been obtained relating to the behaviour of reinforced concrete that is constantly in contact either with water or with sewage, it is permissible to hope that the time is not far distant when the Local Government Board will reconsider its attitude towards this material, and in cases where it is proposed to make use of it will sanction loans on more favourable terms as to the period of repayment than those now in force.

Concrete has been, and is now, extensively used in the construction of reservoirs, sewage tanks, filters, aqueducts, and water towers. Full descriptions of these works are to be found in technical journals and volumes of proceedings of the various engineering societies. The same holds good for similar structures in reinforced concrete, though to a more limited extent, but numerous examples are given in the catalogues issued by the various firms specialising in this class of work.

Mass concrete has been largely used in the construction of sewers of 4 feet diameter and upwards. It is moulded in the trench and supported by centering until set. Elliptical sewers are also constructed in this manner. In recent years reinforced concrete has been employed for sewers of both types, the mixture being sufficiently stiff to admit of ramming.

Concrete tubes have been extensively employed in main-sewerage work for many years past, being supplied ready for use by firms who have taken up their manufacture.

Concrete tubes, unless strongly reinforced, should be laid on a concrete bed not less than 6 inches in thickness, and the concrete be brought up round the tube as far as the springing. By the omission of this precaution many failures have occurred. In tubes liable to internal pressure the concrete should entirely surround them.

The tubes have ogee, rebated joints which are luted with cement and the inside pointed up. In the case of the John Ellis & Sons 60-inch by 40-inch egg-shaped tube, the joint is a square recessed butt.

For sewers, the tubes are usually 3 feet in length, and are sometimes slightly reinforced by the insertion of three rings of steel ¼-inch diameter, spaced about 12 inches apart. The joints in the rings are welded. There are no longitudinal nor spiral rods. It is found that this simple type of reinforcement gives to the tube increased resistance to crushing.

Tubes are made capable of withstanding high internal pressure, and of resisting water hammer. They are constructed with various systems of reinforcement, and are in use in Great Britain and more generally abroad. It is not possible to refer to all the systems of reinforcement adopted. Generally they consist of various combinations of helicals and longitudinals, with the addition in some instances of circulars.

The "Bonna" system goes a step farther, and is essentially a thin steel pipe strengthened and protected, externally and internally, by reinforced concrete. The internal reinforcement is not taken into consideration in the stress calculations, but its presence is necessary to support the internal concrete. The dimensions of the cruciform steel bar forming the helicals, and the distances of the helicals from one another, together with the thickness of the concrete, vary according to the diameter of the pipe and the pressure to be resisted.

The pipes are frequently manufactured on the site of the works where they are to be laid. They are usually 10 feet in length.

"Bonna" pipes have been used for water mains at Swansea against heads of 246 feet and 500 feet, at Norwich for sewage rising main, head 131 feet, and at Clydebank for water head 390 feet, and are about to be laid at Leeds for water. They have been largely used on the Continent, and 119 miles of 10-inch to 49-inch water mains were in course of construction in Flanders at the outbreak of the war. They have also been largely used in Paris. Twenty years since the Municipality laid down one mile of 6-feet diameter as a rising main for sewage, head 115 feet, in a gallery alongside a steel-riveted main of same diameter. It has been found that the steel main requires considerable maintenance, and the concrete tube none.

The "Siegwart" reinforced pipes are constructed on a most ingenious system. A steel core is revolved while concrete is applied by machinery until the required thickness is obtained. Steel wire is then wound by the same machine spirally over the concrete, in one or more layers as required. The assembled longitudinal rods are slipped over the spirals, and further concrete applied by the machine until the pipe is finished. Siegwart pipes are made 15 feet long for diameters 12 inches to 18 inches, and 12 feet long for larger diameters.

Concrete tubes used as sewers may suffer damage from liquids being discharged into them at high temperatures, also by the discharge of acids. Instances have been recorded where concrete has perished when in contact with sewage. A paper was read by Mr. Sidney H. Chambers before this Institute in April 1910 describing the disintegratory changes in the concrete of the sewage tanks and conduits that occurred at Hampton. To ascertain if concrete tubes would be affected he caused a couple of 9-inch tubes to be placed in the tank for a period of eight months. One was coated with Dr. Angus Smith's composition. The coated tube was not affected. The uncoated tube was attacked over the area that was immersed in the sewage at high level, but which was not in contact therewith at low level. He does not state whether the uncoated tube had been, on removal from the moulds, dipped in a bath of solution of silicate of soda.

In the great majority of cases concrete suffers no damage by contact with sewage. Still, under certain conditions the lime in the cement may be attacked, and, as far as is possible, precautions should be taken to prevent such conditions arising. Further investigation is needed to ascertain why concrete occasionally disintegrates when in contact with sewage.

Concrete tubes are constructed to form manholes, water tanks, and cesspits. Sewers, reservoirs, manholes, &c., are constructed with moulded blocks of concrete, which are supplied by various manufacturers. As illustrating in greater detail the application of concrete to sanitation works, the author then described and illustrated the following examples:—

Failure and reconstruction of concrete-covered reservoir.
Temperature cracks in concrete reservoir wall.
Ejector chamber in concrete with steel-plate lining.
Concrete mole-forming sewage outfall into sea.
Circular hydrolytic tanks in reinforced concrete.

At the end of the Paper an illustrated Appendix was given descriptive of the methods and manufacture of concrete tubes furnished by various firms specialising in such work.

LEICESTER AND LEICESTERSHIRE SOCIETY OF ARCHITECTS.

AN address on the war from an architect's point of view was delivered by Mr. Charles Kempson, F.R.I.B.A., A.M.I.C.E., the President of the Leicester and Leicestershire Society of Architects, at a meeting held under the auspices of the Society at No. 5 St. Martin's East, on Friday, the 22nd inst.

The war, said Mr. Kempson, affected their professional work in many ways. It had put in abeyance all the ordinary new schemes of building, and rendered the scale of interest on borrowed money higher. Banks preferred to reduce their overdraft risks, and to restrict and refuse new facilities. Building societies also raised their rates of interest, and generally refused to entertain new proposals. The outbreak of war at once drove up the price of metals and timber, while through men joining the forces builders found it difficult to complete contracts. In regard to the high rate of war risks insurance, he desired to express a pious opinion. Should any property, on our shores or in London, already insured against fire, be destroyed by being set on fire through a neighbouring property being fired by a bomb, no insurance could be claimed, the fire being an act of war, and 5*s.* per

Digitized by Google

cent. was being asked to cover such bomb risks—over three times the usual fire risk. This appeared to him as being exorbitant on the part of insurance companies. The matter concerned architects, as the insurance money found the means of rebuilding.

The destruction of old-world architectural treasures in Belgium and the North of France was a source of special grief to architects. Many masterpieces of the Middle Ages had gone or were irreparably injured. English architects would wish to help in renewing the voids, but they would rightly hesitate before preparing designs to compete with the memories of buildings erected as the result of the genius of older and foreign generations. The present war was almost the first in which the destruction of buildings of note had been avowedly compassed. Those who remembered the Franco-German war of 1870 had not forgotten that the then French Cathedral at Strassburg, although the city was invested and besieged for some months, was spared, and that the Cathedrals of Rheims, Amiens, and Chartres, notwithstanding the fact that the respective towns were occupied, were not injured. Such masterpieces were in truth world possessions, and until this war had been held sacred. German "Kultur" had appeared, and it was not without "Kultural significance" that the Germans had expressed their capability and intention of rebuilding Rheims on better lines! It was too early for forecasts, but he thought that when the people of Belgium returned to their native soil shelter huts would be the first requirement, and these would be of a purely economic and utilitarian character. In the rebuilding of the towns and villages there would be much scope for town planning, and he hoped that the efforts of those interested in the better housing of the people would be on the lines of the best English Garden City work.

Mr. Pick, Mr. Stretton, and himself had appeared before a committee of the Town Council with the object of getting a relaxation in the width of carriage-way and the cost of the formation of secondary roads as distinguished from primary or main thoroughfares. It was suggested that the width of cheaper roads on the outskirts should be maintained at a spacious dimension by the use of grass margins. The cheaper the land the more serious in proportion was the cost of the road. Mr. Kempson paid a tribute to the memory of Mr. Stockdale Harrison, who was President of the Society from 1890 to 1892, and in conclusion said that after the war there would be a big building boom. It was to be hoped that the real work would be in harmony with ideas in regard to future developments.

BUILDING IN MEDIÆVAL TIMES BY THE GUILDS.

THE first of a new series of "craft" lectures, which have been a feature of the Carpenters' Company's educational activity for many years past, was delivered at Carpenters' Hall, London Wall, on Wednesday, the 20th inst., by Mr. C. Delisle Burns, M.A. The subject was handled on broad lines, and for illustrated slides the lecturer had resorted to mediæval manuscripts, to drawings, and to photographs of Belgian as well as English buildings.

In his opening remarks he pointed out that all work while the guilds were active was in a sense co-operative, for (1) the bond which kept the workers (administrators and workmen) together was not merely cash; (2) labour was not treated as a commodity to be bought and sold; (3) all had direct share in the results. Mr. Burns emphasised repeatedly that the mediæval guilds were united for other and higher reasons than because the members might thereby be in a better position to make money out of their work, although each man gained his livelihood out of his trade. The working men, no less than the skilled craftsmen and their apprentices, in the time when these guild houses or halls were erected were spurred on by such things as the glory of the craft to which they belonged or the honour of their town. The essential thing to remember in considering a mediæval guild is that it did not consist of masters and working men, but simply of work in common for a common end and for a definite purpose; each working off his own bat, so to speak, though with a common fund, out of which all could draw, and out of which all expense involved in the production of their buildings was defrayed. From the fund would be drawn money in time of unemployment, old age, or any other crisis; when a member died his guild looked after his burial and then looked after his family.

The range of the mediæval guilds went, however, beyond strictly economic considerations, for very much more than the mere livelihood of the members depended upon their work. Thus there was co-operative building—*i.e.*, all that kind of building directly done out of common funds and of common use. Mr. Burns divided this into three types. First came the town walls or defences (such as York or Chester or old London); these were the earliest result of the independence of craftsmen and traders. Then came the guildhalls and town halls, ranging from the halls of single guilds (*e.g.*, St. Mary's at Lincoln, Merchant Adventurers' at York, or the London City Companies) to the town halls (specially splendid in North Italy and in Belgium) which grew out of the belfries and campaniles—the first symbol of power in the hands of guilds. The final group of co-operative building was the churches and cathedrals. Where local lords were strong they destroyed these belfries and campaniles, so compelling the guilds to erect themselves common buildings under the ægis of the Church. Thus Laon, Soissons, and our own Lincoln are cathedrals built by the townsfolk for many uses besides those of religion. Mediæval towns were, in fact, working towards that civic ideal of "private simplicity and public magnificence." The town walls would be constructed, maintained, and manned by the various guilds; no contractor would be employed for the first two duties. Within the protection of those walls each guild might build its own guildhall for the dispensing of hospitality, the preservation of archives, or the discussion of civic questions. All the guilds produced their own mystery plays, and the properties would be stored in their Hall. Thus an early inventory of the still existing Merchant Adventurers' Hall at York records such items as two devils' cloaks, heads, two trumpets, a cow, and a door of hell.

Particular attention was given by Mr. Burns, in conclusion, to the beautiful guildhalls in Belgium. All of these were put up in a stage of the world's history when cash value was not the only value. The irresistible conclusion is that when men worked for something more than cash they were producing better work than when they recognised cash as their only incentive.

THE WAR AND ENGINEERING.*

UNDER the prevailing circumstances I had little or no alternative in the choice of a subject. We are all intimately connected with the war. The mechanical and other preparations necessary for action, the actual waging of warfare with all its attendant activities, and the readjustment of economic and industrial circumstances, directly involve engineering problems of the first importance and magnitude. It is with great satisfaction that one reflects that over 120 members of the Institution are serving in the active forces at the Front; but it is important also to remember Lord Kitchener's words, "all engaged in carrying out the great work of supplying munitions of war are doing their duty for their King and country equally with those who have joined the Army for active service in the field." Everyone cannot shoulder a rifle, but everyone can and should so order his life's activities as to advance the main idea of defeating the enemy by every form of ingenuity, military or civil, force of arms or trade.

Engineers may be specially useful in accomplishing these aims. War has become very largely a matter of engineering. No one for a moment will fail to realise the vital importance of the skill and experience of the strategists, and the bravery and physical fitness of the officers and men. But they must have the best of equipment, and under modern conditions this calls for the greatest ingenuity, the most reliable workmanship, and the enthusiastic patriotism of engineers and of many other classes of workers; since equipment embraces not only munitions, but clothing, food, and all the necessities of life under exceptionally severe conditions and ever-changing environment.

The first problem, and one which most searchingly tests administration, has reference to transport. This is due to the necessity of great bodies of men, with their impedimenta, having to be moved from point to point with the greatest possible rapidity.

The Kaiser to-day boasts his four or five millions of all arms. The lines of battle in the eastern and western theatres of war are nearly 1,000 miles apart, with intervening railways enabling armies to be moved from west to east and back as the calls of tactics demand. The Allies have legions equally numerous, and from each of the furthest ends

* Address by the President of the Junior Institution of Engineers, the Most Hon. the Marquis of Graham, D.L., C.V.O., C.B.

Digitized by Google

of the world Britons have come in great convoys of steam transports, which dwarf in significance the Armadas of Athens, Carthage, and Rome, and England of old. The prowess of the ancient navigator has been superseded by the ingenuity of the inventor. The trireme and galleys have given place to the leviathan steamship for oversea transport, and road marching has been superseded by railways and road mechanically propelled cars.

Under the stimulation of invention the army impedimenta have grown enormously. The ancient had his spear, shield, and breastplate, and lived upon the cattle and products of the country through which he passed. The modern soldier himself carries more powerful implements of war, while with him must go light and heavy artillery and ammunition, bridge-making plant, pontoons, &c., rail-construction gear, trenching and wire-entanglement appliances, field telegraph and telephone, electric generating machinery for searchlights, &c., aerial machines, kitchen and provision paraphernalia, and field hospitals. The list alone serves to prove that war is a matter of engineering. Indeed, movable factories for repairing the mechanical appliances used by the Army form an important item, and here the internal-combustion engine as a prime mover has proved of great utility.

The power of marching must ever be an important quality in an army, but for long distances engineering has provided more expeditious means. As an example the movements of the British Expeditionary Forces by rail and steamship may be referred to. The Government required the British railways to collect from all parts—north, south, east, and west—troops whose numbers and impedimenta needed 350 trains, made up, on an average, of thirty vehicles each, and to detrain them at the ports of embarkation within forty-eight hours. This great feat was accomplished. As is now well known, most of the troops left from Southampton, and for weeks trains were passed over the lines during the night at the rate of five trains per hour. Such a performance is not only creditable to the organisation of the railways, but proves that the mechanical equipments and direction of the port were most efficient. To tackle the troops, horses, guns, limbers, and other accessories of battalions arriving in seventy-three trains within fourteen hours on successive nights is an unprecedented feat. It is right, however, that similar credit should be given to the harbour authorities at Marseilles, where twenty-eight vessels with our Indian troops and their munitions of war were dealt with in twenty-four hours. Remarkable work, too, has been done by the Russian railway authorities.

Although railways are a great assistance in connection not only with mobilisation, but with the movement of troops in the terrain of warfare, there is an enormous advantage in the greater flexibility of motor-traction routes. In the first place, railways, with their tunnels, are more easily rendered unavailable by destructive work, and the limitations of the loading gauge often create difficulties. Roads are easily repaired, and while neither road nor railway bridges over rivers and canals are immune from destruction, the temporary bridges replacing them need not be so strong for motor vehicles as for railway rolling stock. Again, the motor vehicle is not tied even to the highway; it may cross land, and ammunition, food, and all the other necessities of modern warfare already enumerated have been conveyed by motor lorries to troops confined in trenches stretching intermittently along a battle line of two or three hundred miles. The motor vehicles played a great part, secretly and silently, in the transfer of the British Army from their trenches 100 yards in front of the enemy on the slopes in the Aisne Valley, during the night of October 20, to the new battle front on the Yser. Such an unexcelled strategic movement by a great army would have been almost impossible without motor conveyances in addition to railways. The motor vehicle is of even greater benefit in the transport of the wounded from the fighting line to the base hospital, and thence to more permanent quarters. Many lives are saved through prompt surgical treatment of wounds, and much of the horror usually attending war has been avoided in the present instance because it has been possible, not only to ensure almost instantaneous relief, but to remove the wounded from the environment of battle.

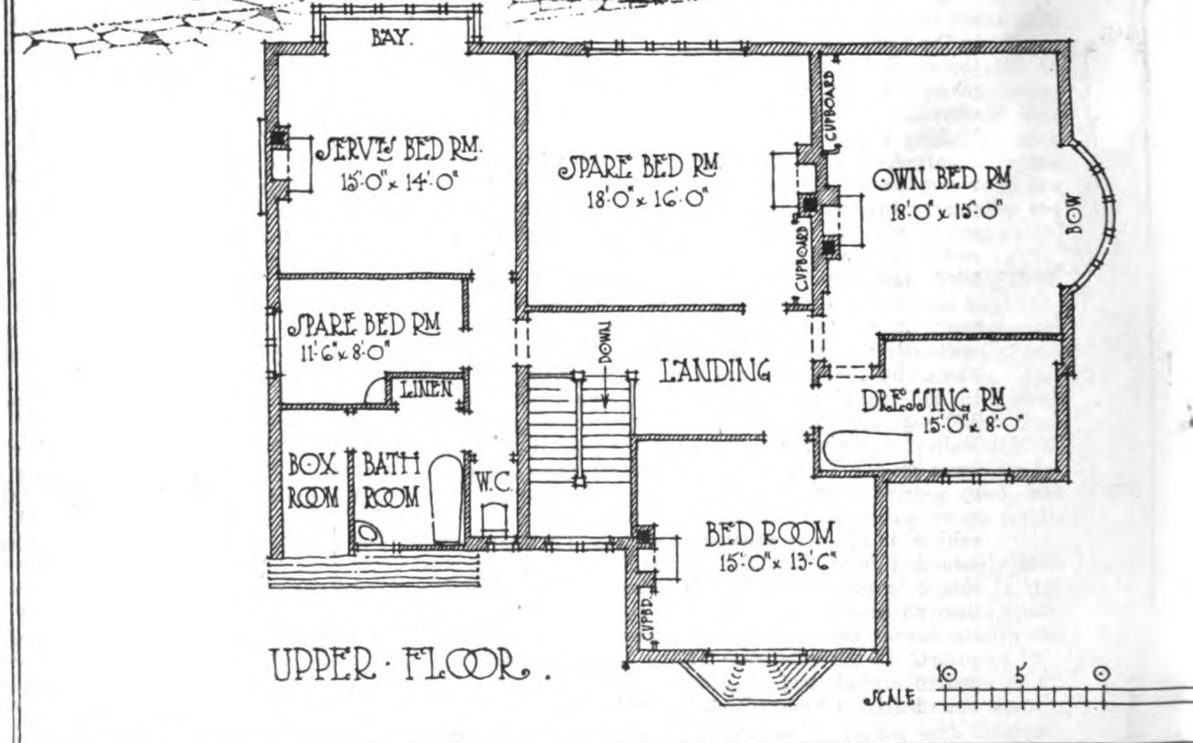
In actual combative work also the motor vehicle has brought changes. Motor-cars, protected by light armour and carrying machine and quickfiring guns, are playing a prominent part, for instance, in clearing the roads of mounted Uhlan patrols, and in helping to eject the enemy lurking in villages and isolated buildings. The motor-tractor has solved the ever-present problem of mobility of heavy artillery. The British 12-pounder guns and 5½-in. Howitzers at Waterloo were the best of their kind; the historian tells us that the French officers were loud in their praise, but that the guns "suffered from the great evil—want of mobility." Nor were the conditions at the Crimea greatly improved. Since that period there have been introduced first steam sappers, as they were called—that is, light and quick traction engines—and more recently petrol-tractors. These, of course, have their limitations, but the power of ordnance has increased side by side with the power of traction, so that the efficiency of a gun in comparison with its weight is far greater to-day than in the old-time wars.

The material of which guns are made now stands three times the breaking stress of the old guns—it is now 55 to 60 tons per inch. The guns are accurately rifled and are breech-loading, with ingeniously conceived and beautifully made mechanism for rapidity of operation. The recoil is taken up by hydraulic cylinders, and the gun trained and elevated also independently of the carriage, and thus the rate of fire is at least 100 times faster than of old. By reason of the superior shot-propelling explosive powder used the velocity is enormously augmented. The perfection of sighting mechanism and the precision and accuracy of elevating and training mechanism have amazingly improved.

As regards Howitzers, the Germans have many 90-pounders with muzzle velocities of about 1,000 ft. per second. The range depends upon the angle of elevation and the resultant trajectory. These Howitzers work up to 65 deg. of elevation, and the high trajectory gives a steep angle of descent with a considerable remaining velocity; both qualities are effective for penetrating cupolas of forts, but they increase the difficulties of accuracy and limit the extent of the danger zone.

Experience has shown that the weight of gun or Howitzer which each horse can pull over field tracks is about 780 lb. The French and German guns, with gunners and equal ammunition, reach the limits for a team of six horses. Thus motor traction becomes a necessity for larger weapons—guns or Howitzers. There is no mechanical difficulty in the design or construction of larger pieces. The limits to weight, and therefore to power, for movable weapons are determined by the safe axle loads on bridges, either for roads or railways, and to a less extent by the solidity of the road bed. In view of the great weight of locomotives, it may be accepted that large guns can easily be transported by rail, especially when the weapons are so constructed that they can be desembled into several units for transport. Road bridges, however, are not always designed to accommodate large loads. It is difficult to set a figure to such limit of load. At the last International Road Congress it was considered sufficient generally that bridges should be capable of taking a 16-ton load; but in Lancashire boilers weighing 30 to 40 tons are frequently taken over the highways, and existing bridges seem to accommodate such loads. Therefore, 20 to 30 tons may be taken over the bridges on main roads, and as fortresses to be attacked are in the region of large towns with good approach roads, immense Howitzers become possible for attack. They can be taken by rail as near as is convenient to the point of emplacement, and thence by road. The German 16½-in. Howitzer, firing a 1¼-ton shell, is for transport purposes, taken apart to make four separate loads, and none of these, including its carrier, weighs more than 25 tons. Each is hauled by three road tractors, with reserves for supplementing the tractive effort through cables and drums on inclines or hilly ground. It will thus be recognised that, so far as traction is concerned, the limit has not yet been reached.

It is yet too early to draw conclusions on the subject of forts, but one cannot ignore the fact that in the design of guns and Howitzers, and in the construction of armour and other protection for forts, there are no limits in respect of weight, so that the engineer has full play for his ingenuity.



The extent to which the field gun and Howitzer is now used has resulted in a great development in the "digging in" system of entrenchment, which in turn has had great influence on reconnaissance work. The aerial branch of the service has thus come into great prominence. From the official despatches we learn that in the first six weeks of the war British aeroplanes flew an average distance of 2,000 miles a day. Nothing is hidden from the observer in the flying machine. He can see behind any screen of cavalry; he can detect the formation of trenches; he can observe the movement of troops by road, by motor 'bus, by train. He can estimate the numbers and even the proportion of different arms. From all this information the strategist can make deductions. Be it remembered, for instance, that an airman

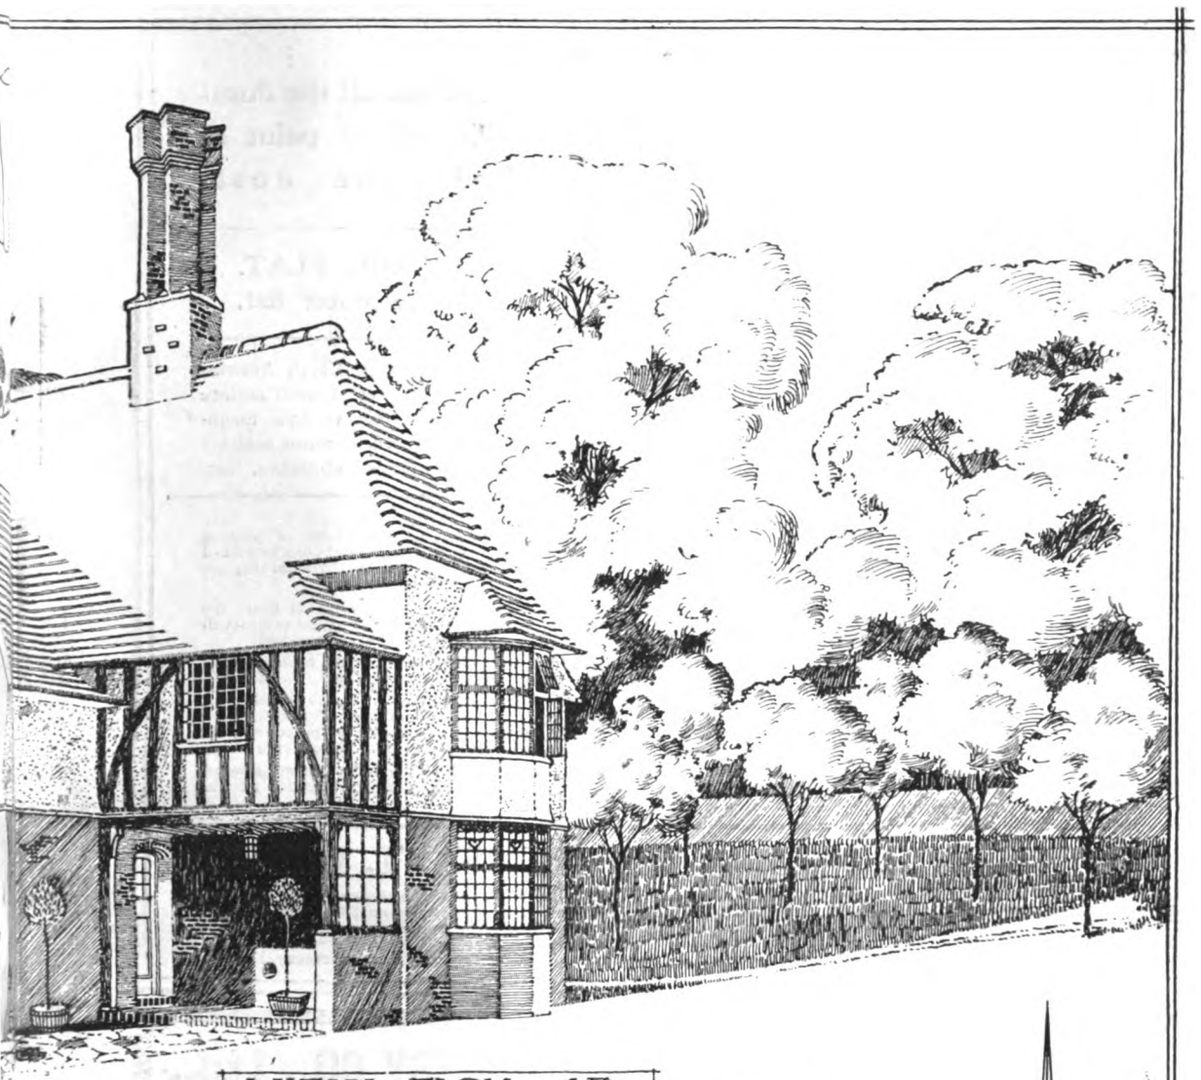
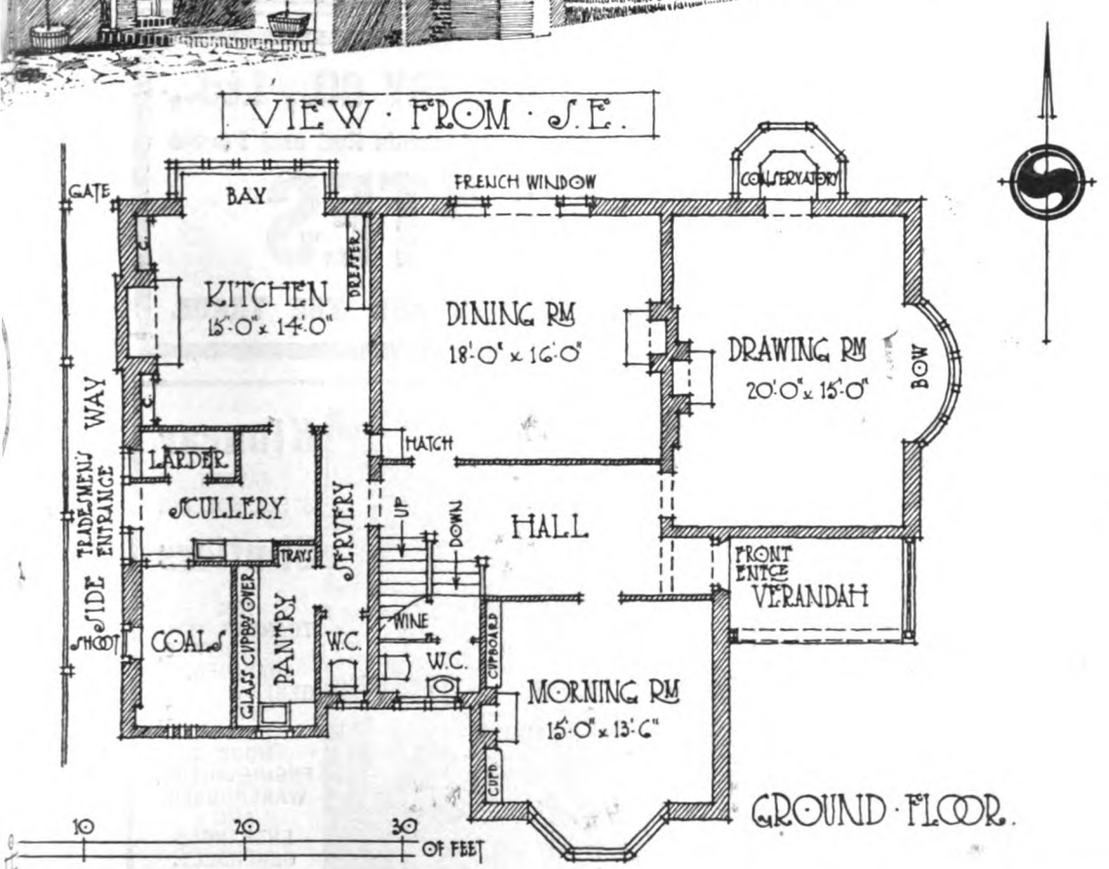
KINGSDOWNE · COTTAGE



KINGSDOWNE RD · SURBITON HILL S.W.
FOR MR & MRS · W. M. MARTIN



THIS house, which is shortly to be erected upon a well situated site in Kingsdowne Road, has been planned with a view to combining convenience of arrangement with a minimum of domestic labour. The accommodation is confined to two floors only, which are connected by an easy staircase, and afford spacious reception rooms and main bedrooms leading from a good entrance hall and landing over. The kitchen quarters are well shut off by a service lobby next dining room, and ample box space is provided off the bathroom and in the roof space above. Externally, the ground storey will be faced with Crowborough bricks, the upper part being rough-casted to a deep cream colour and roofed with dark red

Digitized by Google

VIEW · FROM · S.E.

GROUND · FLOOR.

sand-faced tiles. The verandah, barge boards, and half-timber work will be treated with dark brown Solignum. Internally, the decoration will be simple and in keeping with the style of the house, the entrance hall being paved with red quarry tiles and having, like the dining room, a beamed ceiling treated with dark brown Solignum. The small conservatory is a pleasant feature of the drawing room, which will have a simple ribbed plaster ceiling and be artificially lighted by the "indirect" system. The house is to be wired for electric light and bells throughout, with gas service for fires in dining room and bedrooms, and cooker in scullery. The plans have been prepared by Mr. Moritz R. Martin, A.R.I.B.A., P.A.S.I.

KEYSTONA FLAT FINISH

Possesses all the durability of oil paint at half the cost.

AN OIL PAINT WITHOUT A GLOSS!
WASHABLE AS MARBLE.

AN OIL FLAT.
Not a water flat.

KEYSTONA was placed on the market ten years ago, and at once achieved a phenomenal success in North America (including Canada) from the Atlantic to the Pacific coasts. During the year 1910, 187,500,000 square feet of wall surface were covered with **KEYSTONA.** This is equal to an area of over four thousand acres. **KEYSTONA** is now manufactured in England, and is meeting with as great a success in this country as in America. **KEYSTONA** is more sanitary than any other paint, and is therefore largely used for large public buildings, schools, hospitals, churches, etc.

KEYSTONA has rung the death-knell of Water Paints.

KEYSTONA is an Oil Flat finish giving rich stucco effects unobtainable with either Oil or Water Paints, possessing all the durability and washable properties of Oil Paint.

KEYSTONA is 40 per cent. cheaper than Oil Paint, and only slightly, if any, dearer than Water Paint, giving vastly superior and lasting results.

KEYSTONA enables one man to flat large surfaces, where two and three would be required if any other material were used.

KEYSTONA is free from lead, works like cream, is a perfect white, never goes yellow, and is washable as marble.

KEYSTONA can be washed until it looks like new paint. Oil Paint similarly treated would show shady.

WHAT IS KEYSTONA?

Some of its Advantages.

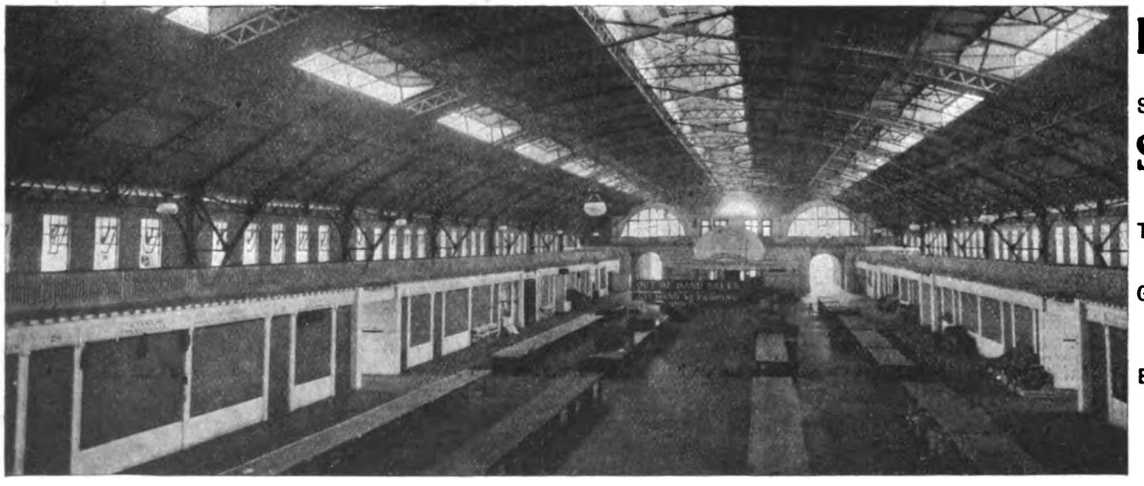
KEYSTONA is proof against the effects of striking matches, and pencil marks. Such marks can be washed off **KEYSTONA** with facility. On Oil Paint they are a permanent disfigurement.

KEYSTONA can be tinted with any good Oil tints; the priming coat mixed with preparatory liquid protects all colours from the action of new lime and moisture.

KEYSTONA is *guaranteed* never to shell, however many renewals may follow from time to time.

KEYSTONA White is supplied of heavy consistency, requiring one to one-and-a-half pints of Turpentine or Turpentine substitute to the gallon for proper working consistency, reducing the cost from 1/6 to 2/- per gallon.

KEYSTONA can be used with equal advantage on wood, iron, and any other surface, and supersedes all Flat Enamels.



KEYSTONE VARNISH CO., Victoria Mills, HUNSLET, LEEDS.

SOME RECENT JOBS EXECUTED IN KEYSTONE: Chester, Chadderton and Leeds Town Halls; Borough Sanatorium, St. Helens; Masonic Buildings, Birkenhead; Meccano Works, Liverpool; Geographical Buildings and First-class Dining Rooms, Central Station, Manchester; St. James's Church, Museum and Annexe of Infirmary, Oldham; General Hospital, Fine Art Academy, and Royal Hotel, Bristol; Pulteney and Empire Hotels, Bath; Queen's Hotel, Aberystwyth; St. Jude's and Christchurch, Sheffield; and numerous other Churches, Chapels and Schools thoughout the country. A very large job at present in progress is the Southmead Poor Law Infirmary, Bristol.

at an altitude of 12,000 feet above London can, if the weather conditions are favourable, scan the whole coast line from Portsmouth to Yarmouth, and see even the shore cliffs of France beyond. The aeroplane observer also assists the gunner in range-finding and aiming. The Germans, for instance, "direct fire by means of squared maps and telephone. Thus when a target is found its position on the map is telephoned to such batteries as it is desired to employ against that particular square. In addition to the guns employed to fire on targets, as they are picked up others are told off to watch particular roads and to deal with any of the enemy using them. If a suitable target is discovered, the airman drops a smoke ball directly over it, or lets fall some strips of tinsel, which glitter in the sun as they slowly descend to earth. The range to the target is apparently ascertained by those near the guns by means of a large telemeter, or other range finder, which is kept trained on the aeroplane, so that when the signal is made the distance to the target vertically below is at once obtained. A few rounds are then fired, and the result signalled back by the aviator according to some pre-arranged code. Undoubtedly the engineer will find scope for his skill and ingenuity in devising means of increasing the reliability of the aeroplane, in effectively protecting its machinery and crew from gun-fire, and in devising a light form of gun of effective power and range, with a mounting capable of giving almost universal training and elevation and depression.

From first to last, as has been expressed by an American war correspondent accompanying the German Army, the impressions of modern war "are those of some great industrial undertaking with powerful machinery in full operation, and endless supply trains bringing up the raw materials for manufacture, rather than of battle as pictured generally."

The Navy is, perhaps, more directly illustrative than the Army of the application of applied science to the prosecution of war. A review of the development of the *matériel* of the Navy would occupy too much time to deal with tonight: moreover, the story has often been told. It would be difficult to name one of the departments of applied science which has not contributed to the evolution of the various types of warship as we know them today. The metallurgist has, in his laboratory, immensely improved the quality of the steel of which the hulls of vessels are made by the introduction of alloys and special forms of heat treatment; the frames and plates can now be made of high tensile material, which increases the resistance to stress, and at the same time enables a reduction to be made in the weight. This applies not only to the heavy plates of the ships of the line, but to the lighter protective plates on the latest high-speed cruisers, as also to the manufacture of armour plate. The ingenuity displayed in the mounting and manipulation of naval guns is as great, if not greater, than in connection with field artillery, while in connection with the gun itself there has been vast progress, so that high ballistics can be achieved without materially increasing the strains on the gun or its durability or its weight. This result is greatly contributed to by the remarkable developments made in explosive compounds. In connection again with propelling machinery, the most effective work has been done in thermodynamics. Thus, as Sir William Beardmore pointed out at the launch of a high-speed light-armoured ship recently, the vessel is fitted with guns of five times the muzzle energy of those of the same size and weight available twenty years ago, while the improvement in projectiles gives a still greater penetrative power. The armour again, although the weight per square foot is only about one quarter, is of greater resisting power than that of twenty years ago. From each ton of machinery it is possible to get four times the horse-power for driving the ship as compared with fifteen years ago.

There are other directions in which the engineer has had influence in connection with the war. It would be difficult to exhaust the list. I have already referred to harbour facilities for embarking and debarking troops. Equally important are the coal-handling appliances, so that warships are withdrawn from the fighting line for the minimum of time for re-coaling. They can now even "coal" or "oil" at sea, without stopping the vessels. Enormous demands again have been made on the textile industries. Armies suddenly raised or mobilised have to be clothed. Manufacturers have had placed with them orders, in some cases for as much as a million yards of khaki cloth, and without the great advance in weaving and other textile machinery, it would have been impossible to supply the material within the few weeks permitted. Corresponding inventive ingenuity has been operative in the cutting and sewing of uniforms and great coats, in the manufacture of boots, saddlery, and other similar necessities for the Army.

In all such instances the events of the past four months have collectively established the high efficiency of Britain as an industrial and engineering nation. Without such efficiency it would be impossible to maintain our Army in the field, even although financial resources were adequate. There has never been any lack of enterprise on the part of our manufacturers. Improvements in appliances in factories, as well as in the implements of war, can only be effected by experiments in chemistry, metallurgy, thermodynamics, and other departments of applied science.

When improvements have been made on mechanical appliances in the factory, it is incumbent on the worker to fulfil his share by making the best use of these, so that their function in the increase of output and the cheapening of production will be realised. Unless this is done, it would be idle to scrap old and buy new machines. Indirectly, again, labour will profit, because with the lessening of the cost of production comes a lowering of the selling price; and not only is the cost of living thereby reduced and the purchasing value of the wage increased, but the increased demand which ensues secures more continuous employment for the workers, a greater demand for labour, and a diminution in the number of unemployed. The cost of production, here as throughout the whole industrial problem, is the dominant consideration. Our educational system has greatly improved during recent years, there is a tendency towards closer relationship between the school and the factory, and it is possible to weld more tightly the connecting links. I think that much could be done by travelling as well as research scholarships in mechanical and other industries. In art such scholarships are numerous, and if an artist can learn much from the study of foreign works, surely the science student can learn much to copy, and perhaps more to avoid, by visiting foreign factories; his creative as well as his adaptive faculty would be stimulated.

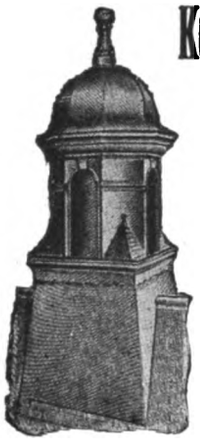
Thus, in the maintenance of our traditions as an Empire, and of our supremacy in industry, the personal qualities essential are not dissimilar. In crises we must exercise restraint and calmness. In action, whether in the battlefield or in commercial pursuits, we must bring into play resource and diligence. We must ever remember that our individual prosperity is indissolubly bound up in the welfare and advance of the whole Empire. We have the great stimulus of an historic past, linked throughout centuries by deeds of self-sacrificing devotion and patriotism, unsullied by ignoble or barbaric acts. To all who have the privilege of sharing in this great inheritance and of passing it on enriched to those who come after us, I give one word of advice. It is, bear in mind always—whether you are a soldier or civilian—

YOUR KING AND COUNTRY NEED YOU.

ART IN LONDON.

BELGIAN ART AT BURLINGTON HOUSE.

To the War Relief (Winter) Exhibition at the Royal Academy Galleries a Belgian section has been added in aid of the artists of the small kingdom at present overrun by the Huns. The latest section forms one-sixth of the complete Exhibition, and includes work which is for the most part of mediocre quality, though there are a few—a very few—brilliant exceptions.



To commence with, the most—we had almost written the only—striking work brings to view a portrait of Mme. la Comtesse de Lalaing by Comte Jacques de Lalaing. It is a virile rendering of a charming subject, whose femininity is sympathetically presented in the profile face, the graceful pose of the head, and the rhythmic swing of the body, nor is the catalogue of good qualities thus exhausted. An ivory bust of the same subject by the same artist lacks most of the interest attaching to the oil-painting, but there is good work in it, and better work in his bronze bust "Génie" and excellent work in his marble "Souvenir de Florence."

M. Isidore Opsomer's coloured etching, "La porte bleu," combines good technique with an artistic sense of chiaroscuro, "distance," and colour. The same subject appears in Nos. 863 and 873, by the same artist, though a different view is taken in 863, and in both instances the process is merely "eau forte sans couleurs." In another subject the same artist exhibits an etching thus doubly treated, but in this case, "L'Eglise," the charm lies in the example "sans couleurs." A marble bust, "Nèle," by M. Charles Samuel, is a fine study of a female head, the slight indication of

ASBESTONE FOR ROOFING

ASBESTONE possesses special advantages as a roofing material which deserve the careful attention of Architects and Builders. We quote five:—(1) It is very light, therefore a far lighter superstructure can be used and expense saved in that direction. (2) Unlike slate, Asbestone is not brittle, and is easily handled and fixed without risk of loss through breakage. (3) It is fireproof. (4) It is absolutely unaffected by fumes and gases and is waterproof. (5) British manufacture.

Please write for our ILLUSTRATED DESCRIPTIVE BOOKLET, specially prepared to supply necessary information and data to Architects and Builders.

The BRITISH URALITE CO. (1908), Ltd. (ROOM 17), 85 Gresham St., E.C.

Digitized by Google

the irides and pupils of the eyes ensuring against the "dead" effect so often noticeable in sculptured faces.

The course of our peregrinations brings us to a couple of paintings by M. Jean Delville, wherein Christ is the central figure. In "The Might of Light stopping the Demon of War" the dignity of this central figure is diminished by setting him on horseback. This and "The World's Hope" are too stiff and wooden altogether, though in general the conception of both is laudable. Miss Alice Ronner in "Roses" makes the mistake of depicting the flower-patterned table-cover as prominent florally as the roses themselves, while Mme. Cambier's "Fleurs" look far more dead than a study in "Nature morte" justifies. There is distinct quality in Miss Jenny Martigny's marigolds and poppies.

A terra-cotta head (No. 966) by the late Paul de Vigne is worthy of high commendation, and so, too, is M. Rousseau's "Jeune fille à la fleur," though the right arm is in effect shrivelled. M. Paul Dubois shows very good work in his plaster studies, "Une ombre qui passe" and "La mère et l'enfant"; and M. Puttemans' plaster "Portrait de Fillette," is full of charm and well portrays the graces of infantile innocence.

With a word of warm approval of M. Vincotte's plaster bust (No. 992) we must conclude this notice. The general level, though (as was remarked at the commencement) one of mediocrity, is seldom lowered beneath that level; but there are some fearful examples of modern "Art" which are extremely painful to view, and which may rank with certain condemnable work of English production.

MON'LITHCRETE STEEL.

AT the end of our letterpress will be found illustrations and, what is more, tables of strengths and prices of this construction (which is extensively and successfully used for concrete floors, foundations, roofs, bridges, staircase stringers, window lintels, piles, &c.), enabling architects, engineers, builders, estate surveyors, &c., in any part of the world to plan, specify, or order by telegram what they require.

This is an enormous advantage to those away from home, and already parcels have been sent to Cairns, Queensland, Perth, Western Australia, Santiago, Chili, Manaos, Brazil, and to the most remote places in the British Islands.

That the construction has come into great favour is shown by the fact that leading architects, engineers, builders, &c., are giving it the preference not only for work of the highest class, such as hospitals, public institutions, country houses, &c., but also for buildings of the factory and warehouse class and for large blocks of artisans' dwellings.

It is a big jump from an earl or millionaire's country house to a labourer's little flat, or from a big bridge to a window lintel, but such is the wide range of this construction.

The cost of the steel is, of course, more per ton than ordinary rolled joists, but in combination with concrete the strength is so much greater that they can be spaced 50 per cent. wider, the resistance of local loads is more than doubled, and there is practically no deflection.

SUPPLIES OF NATIVE TIMBER.

ENGLISH OAK *v.* AUSTRIAN OAK.

As a result of conferences arranged by the English Forestry Association with the Surveyors' Institution and the Royal Institute of British Architects, and in conjunction with other societies, energetic steps are being taken to encourage the demand for English oak in place of Austrian for purposes for which the native timber is eminently suitable. Owing to the recent sales of estates and other causes there are large supplies of English oak and other native timber available, and the English Forestry Association trust that at a time like the present they may rely on the cordial co-operation of all interests to assist in placing the native timber in a position to which it is justly entitled by reason of its valuable properties.

New markets are being organised for native timber, especially for elm, beech, and Scots pine, and full particulars will be forwarded on application.

There are large supplies of native timber available, and a unique opportunity offers to assist in making good a shortage of any timber owing to the effect of the war, which steps will not only help home industries with supplies, but will also much encourage the proper production of timber in this country.

Frequent applications are received by the English Forestry Association for the names of those who can supply native timber and goods manufactured therefrom, and firms are invited to write with particulars of stocks of native timber which they hold, or as to contracts which they could take up. The Association will willingly give every assistance where any difficulty is experienced in obtaining supplies of ash or other timber, and place merchants in touch with estates whence the timber can be obtained.

The English Forestry Association is not a trading association, and does not buy or sell timber or goods either direct or on commission. Its work is to create the demand and to organise supplies of the native timber, and to encourage home industries, but leaving it to the recognised channels to negotiate and supply the demand. All communications should be addressed to the Hon. Secretary, English Forestry Association, Farnham Common, Slough, Bucks.

BUILDING PROGRESS IN THE PROVINCES AND SUBURBS.

A LIST OF WORKS PROJECTED OR COMMENCED.

(N.B.—Local Authorities, architects, and others are invited to submit full particulars for insertion in this weekly list. Where districts are not entered against names of architects and builders the address is as a rule local.)

PATENT SPECIFICATIONS PUBLISHED JANUARY 21, 1915.

Selected by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

No. 29,787. Dec. 27, 1913.—Reuben Squire, 18 Westcroft Terrace, Bideford, Devon. Spray baths.

29,806. Dec. 27, 1913.—F. W. Campbell, 3 Devonshire Park, Bangor, Down, Ireland. Reinforced-concrete piles.

29,850. Dec. 29, 1913.—G. A. Booth, The Phœnix Iron Works, Derby Street, Preston. Firegrates or ranges.

446. Jan. 7, 1914.—H. M. Rogers, 4 Compton Crescent, Grove Park, Chiswick, W. Means for distributing sand on roads.

503. July 8, 1914.—J. P. Smartt, 14 St. James Row, Sheffield. Ventilating device.

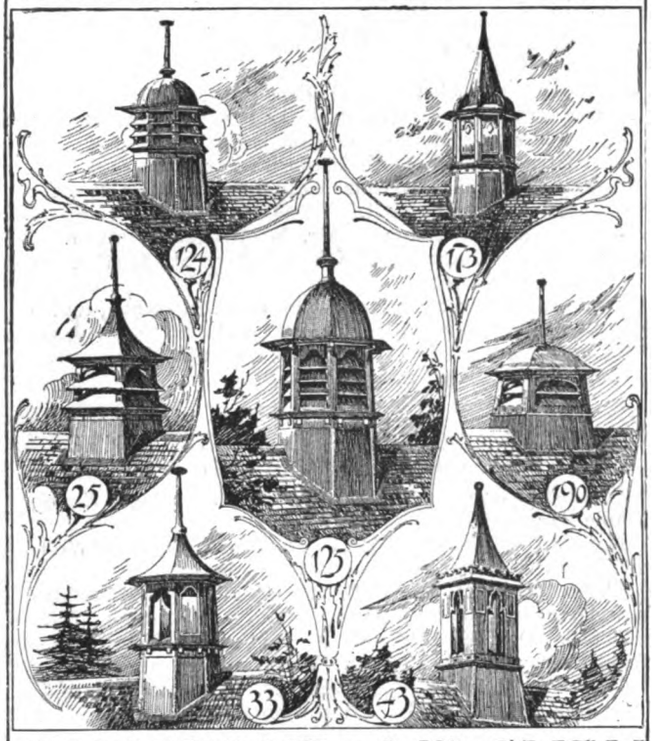
2,643. Feb. 2, 1914.—F. J. Burton, Xela, Oakfield Road, Woking. Fastenings and stays for hinged windows.

6,245. March 12, 1914.—Frederick Woodward, 10 and 11 Lower Titchfield Street, Willenhall. Firebars for grates of ovens and other places where a fire is required.

7,085. March 20, 1914.—Chas. Ferrar, 36 Dagnall Park, Selhurst, London. Strengthening of substrata and apparatus therefor.

9,769. April 20, 1914.—M. M. Gillam, 372 Broadway, Flushing, Long Island, New York. Air supplying and heating device for improving the combustion in stoves and furnaces.

17,164. July 20, 1914.—The British Murac Syndicate, Ltd., and M. M. Dessau, 60 London Wall, E.C. Roads and ways.



Any of the above specifications may be obtained from J. D. Roots & Co.

THE Sheffield Corporation have decided that the Lodge Moor Hospital extensions are to be carried out in three sections. In the first year the work is to comprise the extension of day nurses' home, extension of maids' home, stores block, alterations to present administration buildings, lecture theatre, discharge pavilion, &c., at a total approximate cost of £10,000. In the second year £20,000 worth of work will be completed, comprising three central ward blocks with connecting corridors, reception pavilions, workshop, and destructor house, &c. And in the third year the contract, to the amount of £33,500, will comprise the north three ward blocks, night nurses' home, private patients' block, eight cottages, &c.

THE Swansea Corporation has practically completed its case for the borough extension that is to be the subject of a Local Government Board inquiry next month. It is proposed to take in the parishes of Oystermouth, Llansamlet, Clase Rural, Penderry, Cockett (which includes Sketty, the residential suburb of the borough), and Bynea. This will give an added acreage of 17,964 acres, and an increased population of 29,000. The estimated increase in the rateable value will be about £200,000 per annum. In connection with the borough extension, a main-drainage scheme is being pushed forward, and this provides for the construction of a main sewer a distance of six miles to Oystermouth, and a sewer outfall into the sea off the Mumbles Head. The cost of this scheme is £325,000, and it provides for the drainage of the whole of the proposed added areas.

THE
Architect and Contract Reporter.
FRIDAY, JANUARY 29, 1915.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addresed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than* 2 P.M. *on Thursdays.*

COMPETITIONS OPEN.

BRADFORD.—March 31.—The Corporation invite competitive designs for the re-planning of streets in the central area of the City of Bradford. Mr. Reginald Blomfield, R.A., will act as assessor. Particulars may be obtained on application to the undersigned, accompanied by a deposit of £1 1*s.*, which will be returned on receipt of a *bonâ-fide* design. Mr. Frederick Stevens, Town Clerk, Town Hall, Bradford.

COVENTRY.—The City Council invite competitive plans for the erection of a public elementary school at Folly Lane, Coventry. The competition is strictly limited to architects practising in the City of Coventry. Particulars of the competition may be obtained on application at the Education Office, 44 Bayley Lane, Coventry.

LIVERPOOL.—Feb. 8.—The Corporation invite designs for workmen's dwellings, to accommodate about 500 persons, and proposed to be erected on the site known as the Rathbone Street area. Premiums of £100, £50 and £25 respectively are offered for the first three selected designs, and the Council have appointed Mr. Henry Hartley, F.R.I.B.A., as assessor. The first premiated design will become the property of the Corporation. A plan of site, together with a copy of the printed conditions and instructions, will be forwarded to the applicant on payment of a deposit of £1 1*s.*, which will be returned on the receipt of a bona-fide set of drawings. Mr. E. R. Pickmere, town clerk, Municipal Offices, Liverpool.

CONTRACTS OPEN.

ASHCHURCH.—Feb. 10.—For the erection of six cottages at Aston Cross, Ashchurch, for the Tewkesbury Rural District Council. Deposit 10*s.* 6*d.* Messrs. Protheroe, Phillott & Barnard, architects, 31 Promenade, Cheltenham.

ASHTON-UNDER-LYNE.—Feb. 1.—For supply and delivery of about 21 tons of structural steelwork, comprising roof trusses, stanchions, joists, angle brackets, &c., for the Stalybridge and Dunkinfield Joint Sewerage Board. Deposit 10*s.* 6*d.* Mr. C. J. Lomax, A.M.I.C.E., engineer, 37 Cross Street, Manchester.

BALDOCK.—Feb. 15.—For erection of six cottages with outbuildings at Hinxworth Place, Farm, for the Hertfordshire County Council. Mr. W. H. Crozier, land agent, 60 Fore Street, Hertford.

BEESTON.—Feb. 17.—For erection of pumping station, destructor, office and mess room, &c., on the sewage disposal site at Beeston, Notts, for the Beeston Urban District Council. Deposit £2 2*s.* Mr. W. H. Radford, C.E., engineer, Albion Chambers, King Street, Nottingham.

BLACKWOOD.—Feb. 15.—For erection of a Presbyterian chapel at Oakdale Village, near Blackwood. Send applications and £2 2*s.* deposit by Feb. 1 to Mr. A. F. Webb, M.S.A., architect and surveyor, Tredegar Chambers, Blackwood, Mon.

BROADSTAIRS.—Feb. 8.—For the construction of the following works at the proposed town depôt at the rear of Grosvenor Road—viz.: (*a*) Buildings, cart sheds, cottage, fencing, &c.; (*b*) weighbridge—for the Urban District Council. Mr. H. Hurd, C.E., town surveyor, Council Offices, Broadstairs.

CARTMEL FELL (LANCS.).—Feb. 8.—For erection of a cottage on their estate at Tower Wood, in the parish of Cartmel Fell, for the Windermere Urban District Council. Whole tenders. Mr. C. E. Hines, surveyor, Council Offices, Broad Street, Windermere.

COVENTRY.—Feb. 10.—For the enlargement of Little Heath Council School, Coventry, for the Education Committee. Deposit £1 1*s.* Messrs. G. & I. Steane, architects, 22 Little Park Street, Coventry.

ELY.—Feb. 4.—For extension of Ely (Cambridge) Post Office, for the Commissioners of H.M. Works and Public Buildings. Deposit £1 1*s.* The Postmaster, Ely, and H.M. Office of Works, Storey's Gate, London, S.W.

HANDSWORTH.—Feb. 9.—For repairs, &c., to sixteen houses at Ash Grove, Handsworth, for the Great Western Railway. The Engineer, Wolverhampton Station.

HEMSWORTH.—Feb. 19.—The West Riding Education Committee invite whole or separate tenders for the following works in connection with additional classrooms at the Hemsworth Kinsley Council School—viz.: Builder, joiner, slater, plumber, plasterer, painter. The Education Architect, County Hall, Wakefield. Send £1 deposit by separate letter to the West Riding Treasurer, County Hall, Wakefield.

HOLMES CHAPEL.—Feb. 4.—For erection of a proposed Council school at Holmes Chapel, Cheshire, for the Administrative Sub-Committee for Education for the Congleton Union area. Deposit £1 1*s.* Messrs. Alfred Price & Sons, architects, Sandbach.

Plans Prepared and Estimates given for Blinds to Architects' Special Requirements.

Digitized by Google

HULL.—Feb. 8.—For erection of a hospital on the Grove House Estate, Newland, for the Guardians of Sculcoates Union. Deposit £1 1*s*. Mr. T. B. Atkinson, M.S.A., architect, Trinity House Lane, Hull.

ILFORD.—Feb. 9.—For erection of a building providing additional lavatory accommodation at the rear of the Town Hall, for the Ilford Urban District Council. Deposit £1. Mr. H. Shaw, M.I.C.E., engineer and surveyor, Town Hall, Ilford.

IRELAND.—For rebuilding premises at corner of Richmond Street and Linenhall Street, Derry. The work includes the removal of the existing buildings and the erection and completion of three shops with flats overhead. Mr. William J. Doherty, architect, 12 Castle Street, Derry.

IRELAND.—Feb. 10.—For the reconstruction of the old portion of their Portadown Station roof, for the Great Northern Railway Co. (Ireland). Deposit £2 2*s*. The Engineer's Offices at Dublin and Belfast. Mr. T. Morrison, secretary, Amiens Street Terminus, Dublin.

IRELAND.—Feb. 13.—For building and fencing twenty-seven labourers' single cottages, for the Milford Rural District Council. Mr. S. Watters, clerk, Council Offices, Milford.

LEIGH (LANCS).—Feb. 6.—For erection of a United Methodist Church, Plank Lane. (Mr. W. Hugill Dinsley, architect, 12 Cleveland Street, Chorley.) Deposit 10*s*. 6*d*. Rev. E. Crosby, Wigan Road, Leigh, Lancs.

LITTLEHAMPTON.—Feb. 10.—For erection of an isolation hospital at Wick, near Littlehampton, for the Littlehampton Urban District Council. Deposit £1 1*s*. Mr. H. Howard, F.S.I., surveyor, Town Offices, Littlehampton, Sussex.

LITTLEHAMPTON.—Feb. 10.—For erection of public lavatories, &c., at Sea View Cottage, near Parade, for the Littlehampton Urban District Council. Deposit £1 1*s*. Mr. H. Howard, F.S.I., surveyor, Town Offices, Littlehampton, Sussex.

LONDON.—Feb. 4.—For preparing and laying new paved flooring to isolation ward B 5 and engine room at the Infirmary, &c., for the Guardians of Mile End Old Town. Deposit £1 1*s*. Mr. E. J. Harrison, architect, 9 Gray's Inn Square ,W.C. The Clerk to the Guardians. Bancroft Road, E.

LONDON.—Feb. 11.—For the repair and renewal of the iron and lead gutters, and also for the repair of the lanterns to the stable roof of the Council's depôt buildings, Stockwell Road and Combermere Road, Stockwell, for the Lambeth Borough Council. Mr. H. Edwards, C.E., borough engineer, Town Hall, Brixton Hill, S.W.

MALDON.—Feb. 1.—For erection of a recreation ground keeper's lodge and ladies' lavatory, also a gentlemen's convenience, on the Public Recreation Ground, for the Town Council. Mr. T. R. Swales, M.I.C.E.I., borough engineer and surveyor, Municipal Offices, Maldon.

MANCHESTER.—Feb. 2.—For supply of an organ, seatings, pulpit, &c., for a new church at Styal, Handforth, near Manchester, for the South Manchester Board of Guardians. Deposit 10*s*. 6*d*. Mr. Fred. H. Overmann, F.M.S.A., 49 King Street, Manchester.

NEWCASTLE-UNDER-LYME.—Feb. 8.—For the construction and erection of children's receiving home. The work comprises general structural work in connection with the buildings and out-offices, sanitary fitting, hot-water supply, gas fitting, drainage, fencing, laying out grounds, and other incidental works. Send application and £3 3*s*. deposit by Feb. 8 to Messrs. Chapman & Snape, architects, Newcastle-under-Lyme.

NEWTON-IN-MAKERFIELD.—Feb. 6.—For erection of thirty cottages in their district, for the Newton-in-Makerfield Urban District Council. Deposit £1 1*s*. Mr. A. Briggs, F.S.I., Town Hall, Earlestown.

NORTH SHIELDS.—Feb. 8.—For (1) the erection of stables at the Union Institution, 50 Preston Road, and (2) the extension of the Receiving Home, Military Road. Mr. Wm. Stockdale, A.R.I.B.A., architect, 81 Howard Street, North Shields.

NORWICH.—Feb. 17.—For erection of a pair of children's homes, for the Guardians. Deposit £1 1*s*. Messrs. Morgan & Buckingham, architects and surveyors, 1 Upper King Street, Norwich.

PENZANCE.—Feb. 8.—For the erection of workmen's dwellings on the Weeths Field, for the Town Council. Messrs. Cowell & Drewitt, architects, Lennard's Chambers, Penzance.

PORTSMOUTH.—Feb. 4.—For carrying out of extensions to the infectious diseases hospital at Milton, comprising the addition of three new wings, a nurses' block, extension of laundry, mortuary, &c., for the Town Council. Deposit £3 3*s*. The Borough Engineer, Town Hall, Portsmouth.

PORTSMOUTH.—Feb. 8.—For alterations and additions to Conway Street Council School, for the Education Committee. Mr. A. H. Bone, surveyor, Cambridge Junction, Portsmouth.

RADCLIFFE.—Feb. 13.—For the construction and completion of sixteen dwelling-houses (in eight blocks of two each) on the Stand Lane site, for the Radcliffe Urban District Council. Deposit £2 2*s*. Mr. W. L. Rothwell, engineer and surveyor, Council Offices, Radcliffe.

ROCHDALE.—Feb. 1.—For contract A. 102, erection of substation buildings (1915), for the Electricity Committee. Deposit £2 2*s*. Mr. C. C. Atchison, M.I.E.E., engineer and manager, Dane Street, Rochdale.

ST. HELENS.—Feb. 23.—For erection of a refuse destructor, together with all contingent works, at the Parr Depôt, within the borough. Deposit £2. Mr. A. W. Bradley, M.Inst.C.E., borough engineer, Town Hall, St. Helens.

SALFORD.—Feb. 5.—For general repairs to the exterior of the fabric of the Poor Law Institution, Eccles New Road, for the Guardians. Deposit £1 1*s*. Mr. F. Townson, clerk, Poor Law Offices, Eccles New Road, Salford.

SANDON.—Feb. 4.—For erection of a sanatorium at Sandon, near Chelmsford, for 110 patients, together with administration blocks, detached buildings, water supply, drainage, and sewage disposal schemes complete, for the Essex County Council. Send applications and £5 deposit by Feb. 4 to Mr. G. Topham Forrest, F.G.S., county architect, 79 Duke Street, Chelmsford.

SCOTLAND.—For the various works required in erection of a bungalow, Buckie. Messrs. G. Sutherland & C. George, architects, Aberdeen and Buckie.

SCOTLAND.—Feb. 2.—For extension of Coatbridge Post Office, for the Commissioners of H.M. Works and Public Buildings. Tenders are required for the whole work, and not for separate trades. Deposit £1 1*s*. The Clerk of Works, H.M. Office of Works, Head Post Office, Glasgow, and H.M. Office of Works, 3 Parliament Square, Edinburgh.

SCOTLAND.—Feb. 4.—For the several departments of work of erecting a new ward block at the Hospital, Bellsprings Road, Annan, for the Board of Directors of Annan Combination Hospital. Deposit £1 1*s*. Mr. A. Tweedie, architect, 43 Lady Street, Annan.

SCOTLAND.—Feb. 8.—For the construction of a masonry lifeboat house, mass concrete and reinforced concrete (Considère system) substructure, and launching slipway, together with a timber approach thereto, at the Salmon Rock on the south-east side of Wick Harbour, co. Caithness, upon the foreshore and sea bed thereat, for the Committee of the Royal National Lifeboat Institution. Deposit £1. Mr. G. Jamieson, the local hon. secretary, Wick, or Messrs. Douglass, Lewis & Douglass, engineers and architects, 15 Victoria Street, Westminster, S.W.

SCOTLAND.—Feb. 16.—For erection of three double cottages for workmen at Lochgoilhead, for the Glasgow Corporation. Deposit £1 1*s*. Mr. J. Whitton, superintendent of parks, 249 George Street, Glasgow.

SHEFFIELD.—Feb. 2.—For the supply of materials and works required in connection with the erection of a transformer sub-station in Carr Road, Walkley, Sheffield, for the Electric Supply Committee. Deposit £1 1*s*. Mr. S. E. Fedden, general manager and engineer, Commercial Street, Sheffield.

SHIPTON BELLINGER.—Feb. 10.—For the erection of a pair of cottages for county roadmen on a site near where the road from Grateley Station to Shipton Bellinger crosses the road from Andover to Amesbury, for the Hampshire County Council. Mr. W. J. Taylor, county surveyor, The Castle, Winchester.

SOUTHEND-ON-SEA.—Feb. 12.—For construction of an electricity sub-station at Thorpe Bay, for the Corporation. Deposit £2 2*s*. Mr. E. J. Elford, M.I.C.E., borough engineer, Municipal Buildings, Southend-on-Sea.

TAUNTON.—Feb. 1.—For erection of a public convenience at North Town, for the Town Council. M. D. Edwards, A.M.I.C.E., borough surveyor, Municipal Buildings, Taunton.

WADDON.—Feb. 12.—For extension of buildings at Waddon Waterworks, for the Croydon Borough Council. Deposit £1 1*s*. The Borough Engineer's Office, Town Hall, Croydon.

WALES.—Feb. 4.—For alterations to Cardiff Head Post Office, for the Commissioners of H. M. Works and Public Buildings. Deposit £1 1*s*. The Postmaster, Cardiff, and H.M. Office of Works, &c., Storey's Gate, S.W.

PORTABLE CHEMICAL FIRE EXTINGUISHERS.

THE British Fire Prevention Committee, after an extensive series of investigations, decided in July 1913 to meet the then increasing danger of badly made liquid chemical fire extinguishers, the defects in which had resulted in fatalities, by creating a standard pressure test for these appliances—namely, a five-minute test at 350 lb.—and later in the year a provisional constructional specification was issued.

This provisional specification met with the approval of the principal authorities concerned, and has served as a basis for the specifications since issued by various Government Departments and other public offices.

Various slight improvements have been suggested regarding the Committee's provisional specification from time to time, and further experiments have been carried out. The result is that the Committee is now able to issue its completed specification, which has come into force as from January 1, 1915, and covers all the general points as to size, strength, precautions against bursting, directions for use, facilities for testing, &c., of importance in such appliances.

In order to indicate that the Committee's requirements are by no means so severe as to handicap the legitimate endeavours of the trade concerned in the production of chemical fire extinguishers, it should be mentioned that various makers are supplying appliances, both to public tender and otherwise, at a reasonable figure, while complying with the requirements indicated in the Committee's specification, and the public purchasing such hand fire appliances are thus advised in future to assure themselves that the British Fire Prevention Committee's specification is being complied with in respect to gear ordered.

Copies of the specification are now available for free public issue, and lists of appliances complying with the specification will also be shortly prepared, both or either being obtainable from the Registrar of the Committee, 8 Waterloo Place, London, S.W., upon written application with enclosed stamped foolscap envelope.

Supplemental to the specification, the following recommendations are added as to the maintenance of such extinguishers, and these, in our opinion, are of vital importance:—

1. Printed directions, brief and clear, for operating and recharging to be posted up near the extinguisher, in addition to the directions on the apparatus.

2. All extinguishers to be examined once a year to see that they are full, that the contents have not been disturbed—e.g., that the liquid contains alkali in solution, and that the acid bottle is properly charged.

3. All extinguishers to be discharged once in three years, and tested by hydraulic pressure to 300 lb. per square inch (20.4 atmos.) for one minute and marked with the date of such test.

4. Those extinguishers in which the acid charge is "unsealed" to be re-charged once every twelve months.

The public are, however, reminded that portable liquid fire extinguishers are not the only form of portable first-aid fire appliance, but that ordinary buckets of water (together with hand pumps) are equally, if not more effective in the majority of cases, and, further, have considerable economic advantages for ordinary household, office, shop, and factory purposes.

AN "ANCHOR-RELIANCE" BULLION ROOM DOOR.

IT is almost a platitude, at the best it is a commonplace, to remark that the present is an age of specialists. Every business, every profession, is divided, sub-divided, and again sub-divided, into distinct compartments. This is no less true of the cracksman's calling: here the top of the tree and the biggest plums are reserved for the trained expert, just as among doctors or architects or even newspaper men. Bill Sykes is replaced by Raffles, the jemmy gives way to nitro-glycerine, the skeleton key to an oxy-acetylene blowpipe. It would be both curious and instructive to be told the way in which our safe-makers have kept ahead, during the past seventy or eighty years, of these gentlemen who have such confused ideas about *meum* and *tuum*. That account might well be written by such a man as Mr. Ed. Tann. Our present purpose, however, is only to illustrate one means adopted in the present year of grace to resist the safe-breaker, or rather the bullion-room or treasury-breaker, by Messrs. John Tann, Ltd., of 117 Newgate Street, E.C., and St. Stephen's Road, Old Ford, E. The bullion-room door here shown embraces all the latest know-

ledge on the subject, and is in itself of very considerable interest. Particular attention should be paid to the crane hinge and clenching mechanism (which afford an hermetical seal), and to the time lock (which checks the combination lock), for these mark two most recent advances in this branch of engineering. The door itself is built up of a combination of different materials, each of which has a special function to perform. It is *à propos* to mention that the firm of John Tann was, in 1843, under its previous name of E. Tann & Sons, the original inventor and patentee of the system of rendering safes fireproof by the generation of moisture, a system which is now used by nearly every safe manufacturer in one form or another. Consequently there can be little room for doubt that the construction of this latest door will be adequate.

It must not be supposed that John Tann, Ltd., are content to rest their reputation upon mere long descent. As we have already suggested, the motto for such a business as this must be "Progress." Messrs. John Tann are contantly having their work tested either in the laboratory or in an unsolicited way. Thus in December last an official of Farrow's Bank, Ltd., reported that a Tann safe at their Shepherd's Bush branch had "resisted all efforts to open it and preserved its contents intact," in spite of the use of nitro-glycerine by the burglars. Earlier in the year Messrs. Curtis & Harvey, Ltd., tested an "Anchor-Reliance" safe by exploding charges of gelignite at the most vulnerable points, with the result that "the explosive apparently shattered the locks, but notwithstanding this we were unable to open the safe by any mechanical means at our command, and so far as an external examination goes the safe was intact and had withstood this severe test very satisfactorily."

We could go on multiplying instances of practical and theoretical tests which have added to the credit of those "Anchor-Reliance" safes, but enough has been said to prove that Messrs. John Tann, Ltd., are still "going strong."

MESSRS. MATHER AND PLATT, LTD.

MESSRS. MATHER & PLATT, LTD., electrical, gas, textile, hydraulic and fire engineers, of Park Works, Manchester, have had, under the circumstances, a very satisfactory year's business in all their branches.

They have supplied batteries of filters to the Grahamstown Waterworks (South Africa), the Chesterfield R.D.C., Llandrindod Wells U.D.C., and many other waterworks at home and abroad, including the Malay States and New Zealand. An important installation has been erected near Calcutta to supply the district owned by the Alliance Jute Mills with drinking water for their workpeople as well as for general use in the mill. This installation has caused widespread interest in India on account of the exceptionally good results obtained when filtering River Hooghly water, even in its worst state. They are now engaged on a great installation for the Oldham Corporation comprising eighteen filters, each 9 feet diameter, to deal with nearly 3½ million gallons of water per day. A notable success has been achieved with their novel and special apparatus for cleansing the filtering medium.

During 1914 the firm have completed and delivered a number of the well-known high-speed enclosed self-lubricating vertical duplex gas engines. The engine has been further simplified in detail, and it now resembles very closely the high-speed forced lubrication steam engine.

The electrical department has been exceptionally busy, especially in the electrification of mines, collieries, and textile factories both at home and abroad. They have just completed the electrification of a flour mill where the power required is about 2,000 b.h.p.

The application of the "Grinnell" sprinkler and fire alarm, which gives such protection from all classes of land risks as well as from fires on ships, has been given special prominence.

During the past year Messrs. Mather & Platt, Ltd., have supplied turbine pumps for increasing duties. Large numbers of their multi-chamber type pumps have been installed in collieries, where the duties have frequently been in excess of 1,000 feet lift. They have further installed pumps of similar type for hydraulic purposes, generating a pressure head of 1,800 feet (800 lb.). Another useful field for the adoption of turbine pumps is for boiler feed duties.

The firm's textile department, which specialises in the complete equipment of works for bleaching, calico printing, dyeing, and finishing, has been busily occupied, although business has necessarily been curtailed since war broke out.

Messrs. Mather & Platt, Ltd., have lately taken up the manufacture of filter presses for all kinds of chemical purposes, yeast manufacturers, &c., which were formerly largely imported from Germany.

MESSRS. C. JENNINGS & Co., timber merchants and general woodworkers, of 978 Pennywell Road, Bristol, have sent us a list of glass which they have in stock, and which may be interesting to readers in view of the great scarcity at this time. They also hold large stocks of timber and plywood lying in London, Leicester, and other places.

LONDON ASSOCIATION OF MASTER DECORATORS.

A MEETING of the Council of the above Association was held at the Holborn Restaurant on Wednesday, January 13.

The Conciliation Committee reported the result of the conciliator's award in connection with the dispute between Messrs. Green & Abbott and their employees, a copy of which has already appeared in *The Architect and Contract Reporter*.

The result of the action Dakin *v.* Lee was also formally reported.

The Secretary read a letter which had been circulated amongst the trade with a view of inducing firms of high standing not already members of the Association to join.

As examples of the work of the Association the success met with in the following matters was pointed out:—

(*a*) The reference of the Operatives' Union to the Board of Trade Conciliator on the question of wages, which was given in favour of the employers.

(*b*) The withdrawal by the Wallpaper Merchants' Association of the advance of 10 per cent. in the price of wallpapers.

(*c*) The complete success on appeal in the case of Dakin *v.* Lee, the judgment in this case being of the utmost importance to the trade.

Mr. J. H. Brettell (Bartholomew & Co.) was elected a member of the Association.

The Discount Committee, which met earlier in the day, reported the result of their proceedings, which were duly approved.

It was suggested that members of the Association might like to have copies of the recent circular to the Press, *re* "Painting in War Time," to circulate amongst their customers, and the Secretary was instructed to ascertain if any of the members would like to have supplies for this purpose.

The Secretary reported the replies to the appeal to the Society of Architects, Quantity Surveyors' Association, and the Royal Institute of British Architects on the subject of inserting a fair wages clause in their contracts.

It was resolved that a sum of four guineas be subscribed towards the deficit in the finance of the National Association of Master House Painters and Decorators of England and Wales, and that a letter be sent to this Association expressing the appreciation of this Association of the services rendered by them in getting the advance withdrawn upon wallpapers during the war, and in arranging for the conservation of a trade discount from all decorator's materials from the principal manufacturers, which is to come into force shortly.

It was resolved that the members of the Council be invited to submit designs of a certificate of membership with a view to issuing same to members of the Association.

VARIETIES.

BATH City Council on Tuesday last resolved to expend £7,750 upon the renovation of the bathing establishment, and to empower the committee to prepare plans for a new establishment in connection with a town-planning scheme.

OVER 700 members of the Institution of Electrical Engineers are serving in the Army and the Navy, chiefly in the Royal Engineers and the engineer units of the Royal Naval Division. Considerable numbers have also joined other branches of the military forces.

SPEAKING at a recruiting meeting in the Vale of Neath, a landed proprietor made the offer of ten freehold building plots to be given to the first ten men who enlisted that night, the only condition being that the applicant should build a dwelling-house within a reasonable period. At the close of the meeting the plots were immediately appropriated.

EDINBURGH Town Council, sitting in committee recently, discussed the clauses of the Corporation Provisional Order, under which the Corporation seeks power to let for hire (but not to sell or manufacture) electric apparatus and appliances for heating, cooking, &c., and also to provide and maintain showrooms for the exhibition of apparatus and fittings. By twenty votes to thirteen the Council decided in favour of the deletion of the clauses.

THE Durham Board of Guardians on Saturday have agreed that a complete scheme should be prepared for the erection of a receiving home and cottage homes to accommodate 100 children. It was stated that the Local Government Board had generally approved of the scheme for the construction of a new workhouse infirmary. An extension of the workhouse laundry was agreed to.

HIS HONOUR JUDGE RUEGG, K.C., during the hearing of a compensation case at the Hanley County Court, expressed the view that it was the duty of partially-disabled workmen who were in receipt of a compensation allowance to find work to suit themselves. A man, he said, should not wait to be asked to find work. It was his duty to find it for himself. Before the Compensation Act men went and found work for themselves, but now the attitude of some of them was to rest on their compensation. If a man, for instance, could not stand up to work, then he ought to find some suitable occupation which he could perform whilst sitting down.

THE new church of St. Michael, Little Coates, Grimsby, was consecrated this week by the Bishop of Lincoln. The new edifice incorporates within its structure portions of the old church dating back several centuries. The new stone is from the Weldon quarries, and the work has been carried out to harmonise as far as possible with the older work. Seating accommodation for 250 persons has been provided. Mr. Walter Tapper, F.R.I.B.A., was the architect, and the builders were Messrs. J. Jarvis & Sons, of Hackney.

THE Estates Committee of the Exeter City Council have considered a report from Mr. Harold Brakspear, F.S.A., from the old house found in King Street, during the demolition of some property there. Mr. Brakspear said it was a building most certainly dating back to Norman times, with additions and alterations in the fifteenth century and in Tudor times. It is noteworthy not only for its original date, but for the remains of the later additions, and it would be a pity if it could not be preserved. The city surveyor has been asked to prepare an estimate of the cost of restoring the premises.

THE L.C.C. General Purposes Committee have reported as follows concerning the coat-of-arms of the Council: "We reported on November 24, 1914, that we were taking steps to secure that the arms of the Council shall be reproduced on such county property as is appropriate without in any way superseding the use of the letters L.C.C. as indicative of the Council and its services. In this connection we have given direction for the arms to be displayed upon the blank shield appearing in the design of the seal of the Council. On this shield appeared, at the time the design was adopted, a cross of St. George, but as reported by us on March 14, 1911, we then arranged for this inaccuracy to be corrected, and the shield has since been without device thereon. We have adjourned until the conclusion of the war the question of the submission of a suggestion for a motto for the Council."

UNDER the auspices of the National Housing and Town-planning Council, a conference of the local authorities of the Western Midlands will be held in Birmingham next week to consider housing and town-planning administration, with especial reference to the administration of the new Housing Act during the period of the war. The gathering will be presided over by the Chairman of the National Housing and Town-planning Council (Councillor Harold Shawcross, of Rochdale). Papers have been prepared by Mr. C. W. Hill (housing estate manager, Barnet) on Barnet's housing scheme, Councillor George Cadbury, junr., on the limitation of houses to the acre, and the Chairman of the Conference on the cost of land development and house building under town plan schemes. A report is also to be discussed on the administration of the Housing Acts by local authorities in England and Wales, and a report will further be laid before the conference on rural planning.

THE annual meeting of the South Wales Federation of Master Builders was held at the Victoria Hotel, Pontypridd, on the 21st inst., the President (Mr. R. W. Moon, of Newport) in the chair. The Secretary (Mr. Isaac Watkins) submitted a report of the year, and the Treasurer the accounts and balance sheet. Both were adopted. The following officers were elected for 1915: President, Mr. Herbert Waring (Messrs. Waring, Cole & Waring, contractors, Neath); Senior Vice-President, Mr. J. Jones (Messrs. Jones Bros., Merthyr Vale); Junior Vice-President, Mr. T. F. Howells, Caerphilly. A revised form of contract, which had been prepared by Mr. T. Mansel Franklen (Glamorgan County Council), to meet the views expressed by the builders at a recent interview, was considered, and referred to the sub-committee to deal with. The Pontypridd and Caerphilly delegates drew attention to the practice of local authorities in inviting tenders for jobs varying in price from £400 to £4,000 without quantities, and a strong feeling was expressed against this practice as being unfair to the builders. It was resolved that all the branches be communicated with so as to secure a uniform practice throughout the district.

FORTHCOMING EVENTS.

Friday, February 5.

Institutes of Municipal and County Engineers (Metropolitan District): Discussion on Paper by Mr. H. D. Searles-Wood, F.R.I.B.A., entitled "Building By-laws and a Court of Appeal," at 8.15 P.M.

Monday, February 8.

Royal Academy: Lectures on Sculpture (3) "The Highest Period of Greek Sculpture," by Sir Charles Waldstein, Litt.D., Ph.D., at 4 P.M.

Wednesday, February 10.

Royal Academy: Lectures on Sculpture (4) "The Position of Painting in the Arts of Ancient Greece and the Decline of Greek Sculpture," by Sir Charles Waldstein, Litt.D., Ph.D., at 4 P.M.

Carpenters' Hall: Paper entitled "William Morris as a Craftsman," by Mr. H. J. L. J. Massé, M.A., at 7.45 P.M.

Manchester Society of Architects: Exhibition of Working Drawings, by Mr. P. S. Worthington, F.R.I.B.A., and Mr. J. B. Gass, F.R.I.B.A., at 6.30 P.M.

Thursday, February 11.

Society of Architects: Paper entitled "The Construction and Protection of Buildings in Relation to Fire," by Mr. A. Alban H. Scott, at 7.30 P.M.

Conference on Rebuilding of Belgium opens at Guildhall, London (five days).

LESSONS FROM GERMANY.

IN his paper read before the Architectural Association, Professor Lethaby only lightly touched upon some of the remarkable developments that have made German architecture noteworthy during this twentieth century. With the professor, many of us may candidly say that we do not like it; but we must recognise that modern Hanover, Strassburg, Magdeburg, and Cologne were not built for us to like, but were built for the gratification of German pride and ambition and for German pleasure in doing something different, and therefore, in their own view, superior to the efforts of other nations. As is usual in all modern German activities, their accomplishments in modern architecture are but the expansion and exploitation of ideas borrowed from their contemporaries in other countries. In this, indeed, lies the secret of much of their success in war, in manufacture, and in commerce, and we may say also in architecture, at least as far as success has been attained. For the modern German, whether we like his designs or not, has at least produced a modern architecture of distinctive character and different from any preceding architecture.

More particularly has this been evident in that part of architecture which is most closely connected with what in England we associate with the category of arts and crafts, the fittings and furniture, both fixed and movable, of a building. Modern German architecture may be said to have started from the principles and methods of the arts and crafts movement as applied in England to the design of furniture, to have adapted these principles and methods to the fitments first and then to the internal architectural features of a building, and finally extended the treatment to the external surfaces and forms.

This is what Professor Lethaby had in mind when he said that "the first thing in the arts which we should learn from Germany is how to appreciate English originality." The originality shown by English designers in furniture, glass, textiles, printing, and other branches of arts and crafts activity, which was our particular version of the "art nouveau" movement, was the basis of modern German architecture. On this basis they have impressed the peculiar tokens of German character, its coarseness, its forcefulness, one might even say its brutality. In so doing they have taught us the lesson that it is not necessary to go back to some ancient form of detail in order to invest the architecture of our time with the distinction of style; that style and styles are widely different things; that we have no need of Greek, Roman, Byzantine, mediæval, or renaissance motifs in order to find the means of expression in a real living modern architecture.

Professor Lethaby was, we think, particularly happy in his advocacy of the value of public works as an integral part of national life. He very rightly said that magnificent institutions were "paid for by taking money out of one pocket and putting it into the other." To some extent, as we have before to-day pointed out, this is true of the enormous war expenditure in the throes of which we now live, but there is this great difference that whilst, in the professor's words, "the buildings then add to capital and plant," war expenditure is largely directed to the production of things that are wasted—ordnance, ammunition, clothing, transport—and in this consists the waste of capital to which our leading banking magnates have recently referred. It is not that we are by war wasting capital that had already accumulated in times of peace, but that for a time the labour expended on munitions of war is no longer building up capital; there is nothing permanent to show for the labour that is being lavished.

With public works it is very different. Arterial roads, canals, docks, though they cost money and use up labour, are so much material capital which yields profitable interest to the community as much as if not more than if their cost were safely hoarded in the bullion vaults of the Bank of England. Even an increase in the millions of the National Debt may be advantageous to the nation if it is the effect of labour wisely expended on public works, which may become a more useful form of capital than money in the bank.

Nor is it only public works of strictly engineering nature that constitute profitable capital. Buildings generously planned have their utilitarian value and make for efficiency in public services of every description. The staff of a municipality that is comfortable and roomily housed save the ratepayers' money by economy of time and superiority of service. The spacious railway station of the modern American type makes a saving of time and temper for the passengers, as well as of promptitude and efficiency for the company's staff.

And the influence of fine buildings on the welfare of the community is not confined only to its utilitarian aspect. However consciously unrecognising may be the public of the beauty of a building and of the influence of that beauty upon their mental activity and their moral well-being, that influence exists and makes life happier and therefore labour more efficient. However ignorant a man may be of architectural style and detail, he is subconsciously affected by beauty of form and of colour to an extent that the Philistine would scarcely believe possible.

Digitized by Google

It is beyond question that the phenomenal increase of wealth manifested in Germany during the last quarter of a century is very largely attributable to the wisely lavish expenditure of the Government on public works of every description, and this is a lesson which we may profitably learn from the enemy. Slowly we are perhaps beginning to learn the lesson. The expenditure of public funds on the improvement of our town planning, on the rescue and development of our inland waterways, on the better housing of our less wealthy workers, and, to a limited extent, on municipal buildings, are all steps in the right direction, but the steps require to be more regular, emphatic, and extensive.

A true note was struck by Professor Lethaby in his enforcement of the value of association amongst his immediate audience. In the professional life of our architects there is too great a tendency towards individual isolation, too little recognition of the value of co-operation. Herein is another lesson that we may learn from Germany. It has been said, with an appreciation of truth, if with an exaggeration of statement, that if two Germans should meet on a desert island the first thing they would do would be to form a club. In the modern development of architecture and building the range of activity has become so extensive that it is next to impossible for every man to be adequately acquainted with all that pertains to building, whether in the application of science or in the expression of art. We need in our professional world the recognition by each of the limitations of his own ability, of the helpfulness that might be obtained from the ability of others. Particularly would it be valuable if we had a fuller recognition of the value of consultants, as is done in the medical and legal professions. To be thoroughly proficient in nearly any branch of architectural practice at the present day it is almost essential that a man should be a specialist in that branch. To some extent this practice does obtain: theatres, hospitals, and other classes of buildings are the domain of specialists. But we need something more in extension of this idea. We need the association with others of which the professor spoke, by which we might be in touch with those from whom we could obtain ready assistance as well as, by contact and comparison, gain improvement in our own psychological and artistic development.

In the discussion on Professor Lethaby's paper, Sir T. G. Jackson made the point that "we have always been a people of individual tendencies, with an inborn distrust for everything that the Government does." To a large extent, no doubt, this has been due to our party system of government, which divides us sharply into two camps, one strongly partisan of the men that are in and the other equally confident in the men that are out. Hence the Government, of whichever side it may be for the moment, is always an object of distrust to many. The war has shown us that a Government, with the confidence of the whole nation, can do many things that no party politicians can do, and from Germany we may learn the lesson that a trusted Government, acting for the whole community, can initiate and carry through schemes for the advantage of all. It can use the credit and the resources of the whole nation in the prosecution of public works on a scale that would otherwise be impossible and so accumulate that valuable and profitable capital which generously executed public works become.

NOTES AND COMMENTS.

A highly interesting and important announcement reaches us from the Commercial Intelligence Branch of the Board of Trade as follows: H.M. Commercial Attaché for Russia (Mr. H. Cooke) reports that a desire has been expressed in architectural and art circles in Russia to free themselves from the predominant German influence on the architectural and decorative arts of the country, and to replace it with British ideas. With this end in view the Russo-British Chamber of Commerce, at the instance of Professor Kosiakoff, the President of the (Russian) Architectural Sciences Society, is inviting the co-operation of British Architectural Societies and persons connected with the building and decorative trades for the purpose of holding at Petrograd, after the war, an Anglo-Russian Building Trades and Decorative Arts Exhibition.

All communications in this connexion should be addressed to the Secretary, Russo-British Chamber of Commerce, 4 Gorochovaia, Petrograd.

We trust that the Council of the Royal Institute of British Architects will at once proceed to take its proper place in the lead of the desired British representation. The proposed exhibition might very well be held in connexion with the next international congress of architects, which, it will be remembered, it was intended should be held at Petrograd.

Mr. John Burns has signed an appeal, as President of the Cities and Town Planning Exhibitions Committee, for funds to replace the exhibits sunk in the *Clan Grant* by the *Emden* in the Indian Ocean in October, 1914. It will be remembered that early last year Professor Patrick Geddes received an invitation from the Governments of Madras, Bombay, and Calcutta to go there, with a view to advising as to the development of those cities and on social and housing conditions generally. He was also asked to bring with him the Town Planning Exhibition, which had been shown with so much success at the Royal Academy in 1910, and successively in Chelsea, Dublin, Belfast, and Ghent.

At the time of their despatch the sea route to India was believed to be secure, and only the ordinary risks were insured. Hence the calamity is complete, and the committee have no funds at their disposal with which to reconstruct the exhibit. On receipt of the news an emergency committee was formed, with a view to despatching to Professor Geddes a small representative collection. This appeal has met a friendly response, but more material is required if the whole exhibit is to be adequately replaced. Mr. Burns appeals for the sum of £1,000.

Subscriptions should be sent to the hon. treasurer, John Ross, C.A., 3 St. Helen's Place, E.C.

The London and District Electricity Supply Bill has been wrecked by the failure of its advocates to ensure a sufficient majority for the authorisation of its procedure. On the one hand, the Progressive minority of the London County Council is dissatisfied with the Bill as drawn, because they think the Council's authority is not sufficient. On the other hand, several of London's Borough Councils have already intimated their opposition, because they think themselves insufficiently represented.

The lecture by Mr. John Watson on "The History of the Building of a great Mediæval Church," of which we gave a Note last week, has been followed by a second part, in the course of which the author referred to the new plan of Holyrood Abbey devised by Abbot John as being a great improvement on that originally intended. The nave was widened, but within the limits of the old foundations; also a significant change was made in the design of the western façade by boldly projecting the western towers and extending these clear of the aisles. The original design of the centre gable was shown and explained. The evolution of the pier arcade from a Romanesque motif and the method of designing the vaults which ceiled the nave and aisles were described. In Holyrood, as in all other churches of the first rank, the bay design was tripartite, and here in determining the heights of the various stages a system of proportioning was adopted in accordance with structural necessities. As an explanation of the slow progress in carrying out the design in certain parts, Mr. Watson suggested that the Abbots devoted their energies to pushing on the

THE CLOISTERS, NEW COLLEGE, OXFORD.
From a drawing by Mr. CHAS. S. CARTER, "The Architect" Travelling Student, 1914.

completion of what was particularly their own part of the structure.

The Corporation of the City of London have granted permission for the first conference of Belgian architects, municipal councillors, and others on the subject of the rebuilding of Belgium to take place at the Guildhall on February 11 and 15. On February 12, 13, and 16 there will be excursions to the sites of garden city suburb and municipal schemes. The arrangements have been made by the International Garden Cities and Town Planning Association in conjunction with the Town Planning Institute, the Royal Institute of British Architects, and the Surveyors' Institute, and it is desired that as little expense as possible should attach to the Belgians themselves. As it is proposed to follow the present series of meetings by others in various parts of the country, in order that architects living in the Provinces may more effectively be reached, a considerable liability has been assumed towards which contributions are asked. Gifts of money and offers of assistance may be made to the Secretary, Mr. Ewart G. Culpin, 3 Gray's Inn Place, Gray's Inn.

The annual Report of the Yorkshire Archæological Sociey refers to the protest of the Society against the further introduction of tramways into that part of York within the ancient walls, and mentions that two small concessions were obtained. Sub-clauses were inserted in the Order prohibiting the Corporation from fixing brackets or attachments to any buildings which are ancient monuments within the meaning of the Act, and giving the opportunity to the Commissioners of his Majesty's Works to object if any proposed shelter or waiting-room interferes with the archæological amenities of the city. Some houses of no interest in Bootham, York, have been demolished, and a length of the wall of St. Mary's Abbey exposed to the street; but a scheme

Digitized by Google

which, up to that point, is excellent, is likely to be spoilt by a proposal to cut a gateway through the ancient wall. A suggestion made to the owner that the effigies at Coverham, which for years have been exposed to the action of the weather, should, for their better preservation, be placed in the church or other building, has not as yet been accepted. This is the more unfortunate as they are almost the only effigies in the North Riding which are not now so protected. Through the instrumentality of Mr. H. B. McCall, two fragments of a pre-Conquest crosshead, which for some time have been in the grounds of Myddelton Lodge, were restored to Ilkley Church and fixed to one of the shafts there. The Office of Works continues its excellent work at Richmond Castle, and has also executed some judicious repairs to the Round Tower, or south bastion, of York Castle.

"Whilst it is gratifying to know," adds the Report, "that a more intelligent interest is, on the whole, being shown in the preservation of our ancient monuments of all descriptions, there is still a vast amount of indifference and neglect to be overcome, and much disappointment is experienced in this branch of the Society's work. Even at the present moment we deplore the wholesale and senseless destruction of many most beautiful architectural gems on the Continent, not to mention slighter damage done in our own country to Whitby Abbey and the walls of Scarborough Castle by a nation which is supposed to pride itself upon its scholarship and intellectual attainments."

In the Report considerable space is given to an account by Mr. A. M. Woodward of the interesting work of making excavations on the ancient Roman site at Slack. The work here was continued intermittently until the end of September, four to six workmen being employed.

The work of exploration was materially advanced, and two interesting finds, a denarius of Trajan and a well-preserved iron axehead, of a plain type, discovered also at Newstead and Silchester, were made. The Society can now form a reliable opinion as to the scope, form, and texture of the buildings which originally occupied the site. In following the work a considerable quantity of pottery, more indeed than last year, was found. The coarse pottery, Mr. Woodward points out, is of considerable range and interest and several shapes not met with last year are represented, mostly in small fragments. Apart from the iron axehead mentioned, the finds in metal were negligible. Only one coin was found apart from the denarius of Trajan, but two weights, the larger of bronze, the smaller of lead, are considered worthy of notice. On the whole the results of the season's work are of considerable interest, not only for themselves and the further problems which they suggest, but also for the hopes they raise of the presence of other buildings in fair preservation in the fort.

At least two further seasons' work will be necessary for an adequate examination of the site, and the Roman Antiquities Committee make an appeal for funds for the prosecution of the work. It would, they feel, be a matter for deep regret if lack of funds were to prevent them carrying to a successful conclusion the excavation of what is already seen to be one of the most interesting and best preserved cohort camps in the North of England.

The Town Clerk of Leeds has been notified that the Local Government Board have directed an inquiry to be held "with reference to the formal complaint . . . alleging that the Town Council of Leeds have failed to exercise their powers under Part III. of the Housing of the Working Classes Act, 1890, in regard to the provision of working-class dwellings in the city of Leeds, and the case is one in which these powers ought to be exercised." This communication and the action which it foreshadows revives interest in a question that for some time has periodically yielded animated discussion. At the meetings of the City Council frequent representations have been made, principally by members of the Labour party, that a municipal housing scheme should be entered upon. The answer of the majority on the Council has consistently been that they were not justified in almost inevitably losing money on the promotion of a housing scheme so long as a sufficient number of unoccupied houses at moderate rentals remained without tenants. When property owners in the city decided to advance rents, about twelve months ago, there was considerable unrest in certain districts, and a body known as the Leeds Tenants' Defence League came into being. The League contested several actions in the County Court without success, and in March last they petitioned the Local Government Board, and made "formal complaint under Section 10 of the Housing and Town Planning Act, 1909." The burden of this was that there existed in Leeds a serious shortage of houses, that private enterprise was not attempting to meet the deficiency, and that the City Council "has persistently refused to re-house the people who have been dishoused, and also to provide houses to meet the present shortage." Three maps were enclosed with the petition, which was signed by four resident householders, and it was pointed out that "outside the central undesirable area . . . there are only sixty-five houses in the whole city at rentals from 5*s*. 1*d*. to 7*s*., and only 118 between 4*s*. 1*d*. and 6*s*. per week."

The annual report of the Newcastle Society of Antiquaries stated that the dark cloud of war which had hung over the nation for the past six months had naturally thrown its shadow upon the operations of the society.

"But," it proceeded, "we must not forget that at the time of its establishment, 102 years ago, its founders had lived for years under comparable conditions. Two years and more were then to elapse before the nation emerged victoriously from the Napoleonic wars which had threatened it so long. Notwithstanding this, our predecessors in those troublous times calmly combined to pursue their favourite studies. With their example before us we must not permit, and have not so far permitted, national excitement to extinguish our interests in the pursuits which our society has so long encouraged.

"In this connexion," the Report continued, "it is a matter of poignant regret and reprobation that the governing powers of Germany, a people professing advanced education and much addicted to studies like our own, have permitted the wanton injury of the beautiful old town of Louvain, the Cathedral of Rheims, architectural monuments in Ypres, and other historic places in Belgium and France. The spirit of Antiquity enshrined in sumptious buildings cries out in opposition to such crimes against civilisation."

The society endorsed the appeal of the London Society of Antiquaries to the Government of the United States asking it to protest to the German Government against the barbarous treatment of ancient and beautiful buildings during the course of the warfare. It seemed fitting that two societies, composed of persons now enemies of our King, should disappear from the list of those with whom the society was associated by means of the exchange of publications.

A new guide book to the Blackgate and its museum was issued by the society during the year. Mr. W. Parker Brewis was the author, and to him the council expressed their thanks. A committee had been appointed to consider the best means of improving the conditions under which the collections at the Castle and Blackgate were displayed. Unfortunately the disturbed state of affairs consequent upon the war made it an unfavourable time for appealing to members or the public for special funds, without which so little could be accomplished. Among donations to the museum during the past year, the council specially thank the president for a case

Digitized by Google

containing electrotypes of 208 Roman gold coins found at Corstonitum.

Twenty new members have been elected during the year 1914, leaving a slightly larger number of members than at any previous time.

WAR ITEMS.

THE Board of Trade desire to draw the attention of manufacturers, merchants and shippers to the following regulations governing the export of articles destined for the use of the French Government.

1. Application for permission to export to France goods of which the export is prohibited by Proclamation will receive special consideration if it can be clearly shown that the goods are destined for the use, directly or indirectly, of the French Government. Such applications must be made to the Commission Internationale de Ravitaillement, India House, Kingsway, W.C.

2. Documents issued by provincial military or naval officers, other local authorities, or Government contractors in France, will not be recognised as evidence of the destination of the goods unless formally approved in writing by the competent Department of the French Government.

3. British manufacturers, merchants and shippers are accordingly warned that, before entering into any contracts for the supply of goods stated to be for the use of the French Government, they should first obtain from their clients written evidence that the approval of the Ministry of War, Ministry of Marine, or other Department concerned has been obtained.

4. Application for permission to export the articles in question must then be made in writing to the Commission Internationale de Ravitaillement accompanied by the necessary documentary evidence. The applicants should not proceed with the execution of the order until they have satisfied themselves that a permit to export will be granted.

Any firms accepting contracts without complying with the above regulations will do so at their own risk and with full knowledge that permission to export the goods which they have contracted to supply may be refused.

Applications for permission to export goods which are ordered by firms or individuals in France for purely industrial purposes, and which are not destined for the use of the French Government, will continue to be made in the ordinary manner to the Commissioners of Customs and Excise, Customs House, E.C.

ILLUSTRATIONS.

SHARSTEAD COURT GREAT HALL.

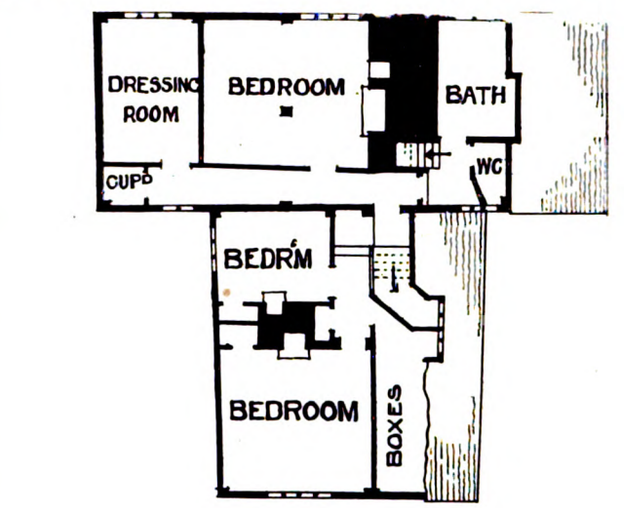
SHARSTED COURT, Doddington, near Sittingbourne, the seat of Alured Faunce de Laune, Esq., J.P., stands in a park of 250 acres. It was owned in the thirteenth century by Sir Simon de Sharsted, but was modernised in the early part of the eighteenth century, when the present front and east wing were added.

Our illustration shows the great hall, which is a portion of an addition to the east wing, recently carried out at a cost of £3,500.

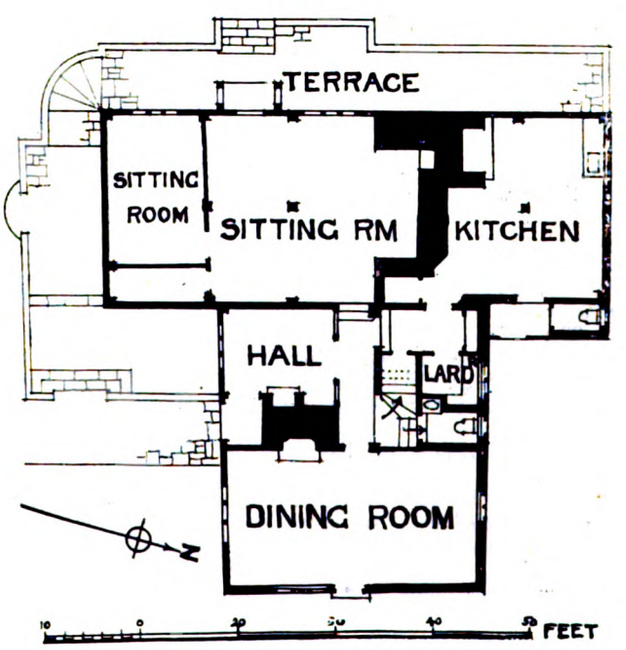
The great hall is 18 feet high, and is oak-panelled to a height of 14 feet 6 inches. The ceiling is of fibrous plaster, taken from an old example at Broughton Castle, and contains ten shields of the Faunce arms and quarterings. A modelled plaster frieze has been introduced above the panelling.

Very old tapestries have been restored and let into the panelling, forming a feature of the room. The stone fireplace is an old one in Kentish rag, which was accidentally dug up in the grounds.

The aim of the whole scheme was to harmoniously blend the new work with the old existing parts, and by carefully studying the details and materials this has been attained.



The oak panelling and oak flooring, and plaster work, was carried out by Mr. Rob. Schaub, of 14 John Street, Bedford Row, W.C., and Mr. Marshall Harvey was the architect.



DESIGN FOR HEAD OFFICES OF PORT OF LONDON AUTHORITY.

THE drawing we reproduce was exhibited in the architectural room at the Royal Academy last year, and shows the detail of Mr. Robert Atkinson's competition design for the head offices of the Port of London Authority—an excellent example of our latest version of Neo-Grec.

BINGLES FARM, LYE GREEN, SUSSEX.

THIS old Sussex Homestead, situated on the rising ground towards Crowborough Beacon and dating back to the sixteenth century, and forming a portion of the estate of Earl De La Warr, and now the property of Sir Howard Frank, has lately been undergoing extensive repair and a certain amount of internal alteration to make it suitable for a "week-end residence." The repairs were taken in hand with a view to altering the general appearance of the

original building as little as possible; but it was found necessary to strengthen the timber construction, for which purpose oak was taken from the old barns, &c., which were removed so as to clear the ground adjoining the house on the north-west. This space is now occupied by the gardens, shown in the photographs. The lead lights containing a good deal of the old glass were carefully removed and re-leaded. A new porch was erected opening out on to a terrace which was formed on the north-west front.

Internally the modern plaster ceilings were removed, and the excellent old stop-chamfered main beams and joist were exposed and new ceilings formed between. A small room

Digitized by Google

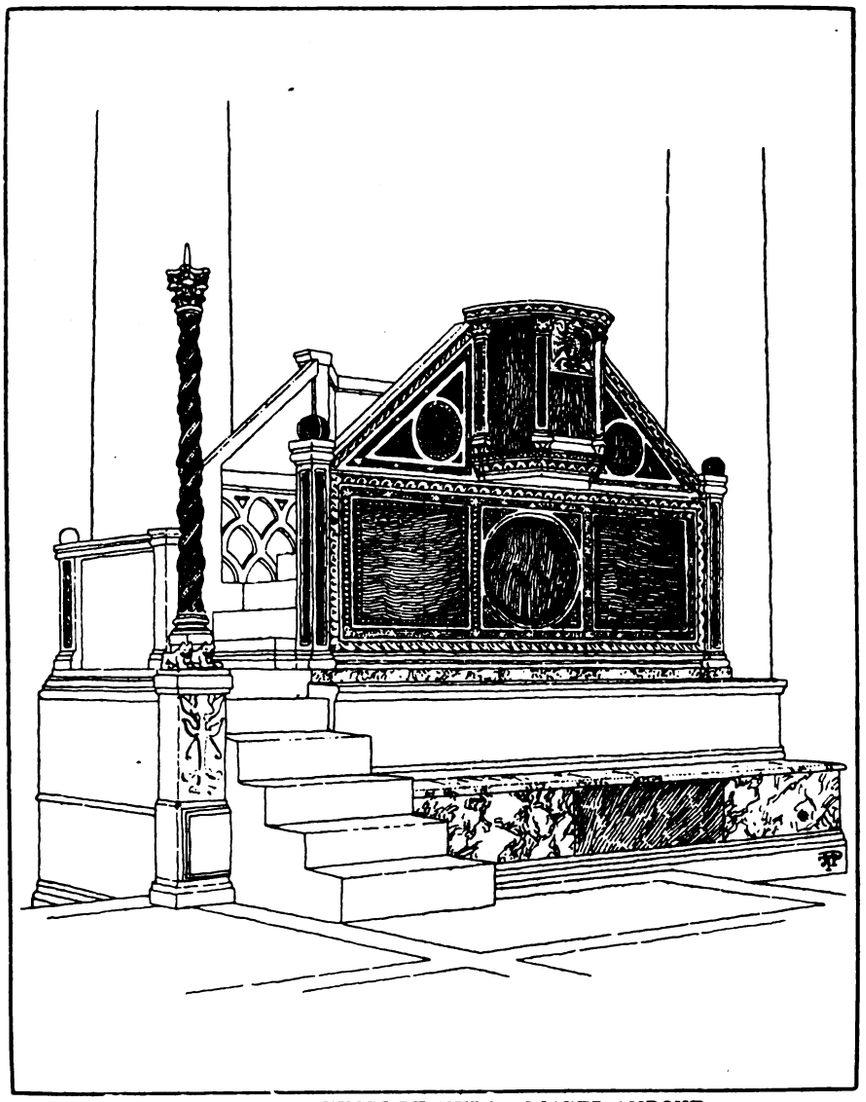


FIG. 5.—S. LORENZO, FUORI LE MURA.—GOSPEL AMBONE.

facing south-east was made into an entrance hall, and new external doorway formed in the depth of the chimney breast and originally a cupboard. The "wattle and daub" inner partition was removed, but the main posts and head were left as an open screen to allow of further light to the passage, and to open out the quaint old staircase. The modern grates were removed and the old openings again formed, the original oak heads being found under the modern plaster.

The old kitchen has been transformed into the large sitting-room, and is interesting owing to the old "roof tree post," which goes right up to the main roof, of which it is an important portion of the structure. This and the ingle fireplace is well shown in one of the photographs.

The old wash-house has been formed into a modern kitchen.

The fine old timbered roof space, reached by the original stair formed of solid oak blocks, has been used for further bedroom accommodation, the space between the timbers being ceiled with plaster. Fortunately, two of the original oak window frames were found built in the gables, and these were carefully opened up, repaired, and releaded, thus avoiding any modern openings being formed.

The building, though small, is distinctly a very good example of the timber-construction work of the period, and considering its age has suffered very little from latter-day "improvements," and these may honestly be said to have now been removed. This work has been carried out according to the designs of Mr. Melville Seth-Ward, F.R.I.B.A.

COMPETITION NEWS.

LONDON.—The winner of the highly important competition for the Board of Trade offices proposed to be erected facing the Embankment and at the rear of the Banqueting Hall, Whitehall, is Mr. E. Vincent Harris, F.R.I.B.A., of 8 New Square, Lincoln's Inn, W.C. In the preliminary stage 187 sets of designs were sent in. The assessors—Sir Aston Webb, R.A., Mr. Reginald Blomfield, R.A., and Mr. Ernest Newton, A.R.A.—selected ten, the authors of which were invited to take part in the second stage, and who each received the sum of £300. Although Mr. Vincent Harris's design has been officially accepted, the work of erection has, we understand, been postponed for the present by the Office of Works. The designs are to be on view from Monday, February 8, to Monday, February 22, from 10 A.M. to 4 P.M., at York House, Kingsway, W.C.

OAKENGATES.—The Salop Education Committee received eight sets of competitive plans for the proposed Technical Institute. The design of Mr. H. H. Brown, F.R.I.B.A., of Manchester, has been selected.

OLDHAM.—At the last meeting of the Education Committee, it was announced that the assessor, Mr. John H. Woodhouse, had made the following awards in connection with the competition for the new infants' school and domestic subjects centre in Ward Street: 1, Mr. F. Thorpe (premium of £15); 2, Mr. T. Hilton (premium of £10); 3, Messrs. Taylor & Simister (premium of £5).

STEPNEY.—At the meeting on Wednesday the Borough Council approved a draft advertisement inviting designs in competition for the proposed municipal buildings in Arbour Square. The suggested accommodation includes a Council chamber, six committee-rooms, mayor's parlour, &c., and offices for the Council's staff. Mr. Henry T. Hare, F.R.I.B.A., has been appointed to act as assessor. Prizes of £100, £75 and £50 will be offered. If a building contract is not entered into within twelve months, the architect whose design is selected will receive £300 on account, and if the building scheme is abandoned or indefinitely postponed a further £300 in full discharge. The draft advertisement says, "A lavish use of ornament is deprecated" and "the Council do not desire the provision of a tower."

THE DIVISION OF THE AMBONE IN ROME.

By J. TAVENOR PERRY.

(Concluded from last week.)

THE ambones of the basilica of S. Lorenzo-beyond-the Walls are on a much larger scale than those already described, and with the screens of the Schola Cantorum, now destroyed, may be regarded as the perfected idea of a choir in the former half of the thirteenth century. Neither their exact date nor the name of the marble mason who worked upon them is known, but they were probably erected between 1216, when Honorius II. connected the nave in which they now stand with the more ancient basilica beyond it, and 1256, the date of the tomb of Cardinal Fieschi, who was a great benefactor to the Church; and as the Paschal candlestick shows considerable likeness to similar works by the Vassalecti, it has been assumed that these ambones are the work of one of that great family of marble masons and mosaicists.

The Epistle ambone (Fig. 5) is a fine piece of simple marble work, having a marble book-desk to the pulpit turned towards the altar, and none at the other end for the Gradual as in San Clemente, and is without any decoration of coloured marble or mosaic, but it is constructed of the peculiar mottled white marble known as Pavonezza. The Gospel ambone facing it (Fig. 6), also in Pavonezza, has Breccia dorata introduced in some of the mouldings and in the revetting of the bottom bench, while the great panels of the ambone itself are magnificent examples of porphyry. The little carving introduced in the cornices, capitals, and bracketing-out of the pulpit is most refined and delicate, and the mosaic in the ribbon borders consists of minute and brilliant glass tesseræ which distinguish the work of both the Cosimati and the Vassalecti.

A comparison between these and those of Sta. Maria in Cosmedin shows that ambones have already increased in importance, and are on the way to that development which resulted in the lofty structures raised on columns that soon became common throughout Italy. In this case the extra height has been gained by the addition of another bench to the ambone front, for the columnar arrangement never seems to have appeared in Rome itself. It must be mentioned that these ambones of S. Lorenzo have been in part constructed of marbles previously used in ancient buildings, and that the Paschal candlestick, which is carried on the backs of two lions, stands on an ancient inverted cippus.

The two ambones in Sta. Maria in Ara Coeli, now standing in the transepts, appear to have been formed out of an older Gospel ambone which must have stood in the nave, the two pulpits being the north and south faces of it, the remainder being used in the ramps and other parts of the reconstruction. The original ambone must have been the work of the earliest of the Cosimati, and on the portion standing towards the ritual north side (Fig. 7) is the inscription + LAVRENCIVS · CVM · IACOPO · FILIO · SVO · VIVS · OPERIS · MAGISTER · FVIT, so that the work belongs to the end of the twelfth century. Some fine slabs of porphyry have been used in the panels, and the eagle, the distinguishing mark of a Gospel ambone, holds a serpent in its claws. The most noticeable detail of this ambone is found in the spiral columns inlaid with mosaic and carried on carved brackets set at the angles of the pulpit; but though in this particular, and in the quantity of its carving, it displays great richness, it lacks the classic repose of the more beautiful ambone of S. Lorenzo.

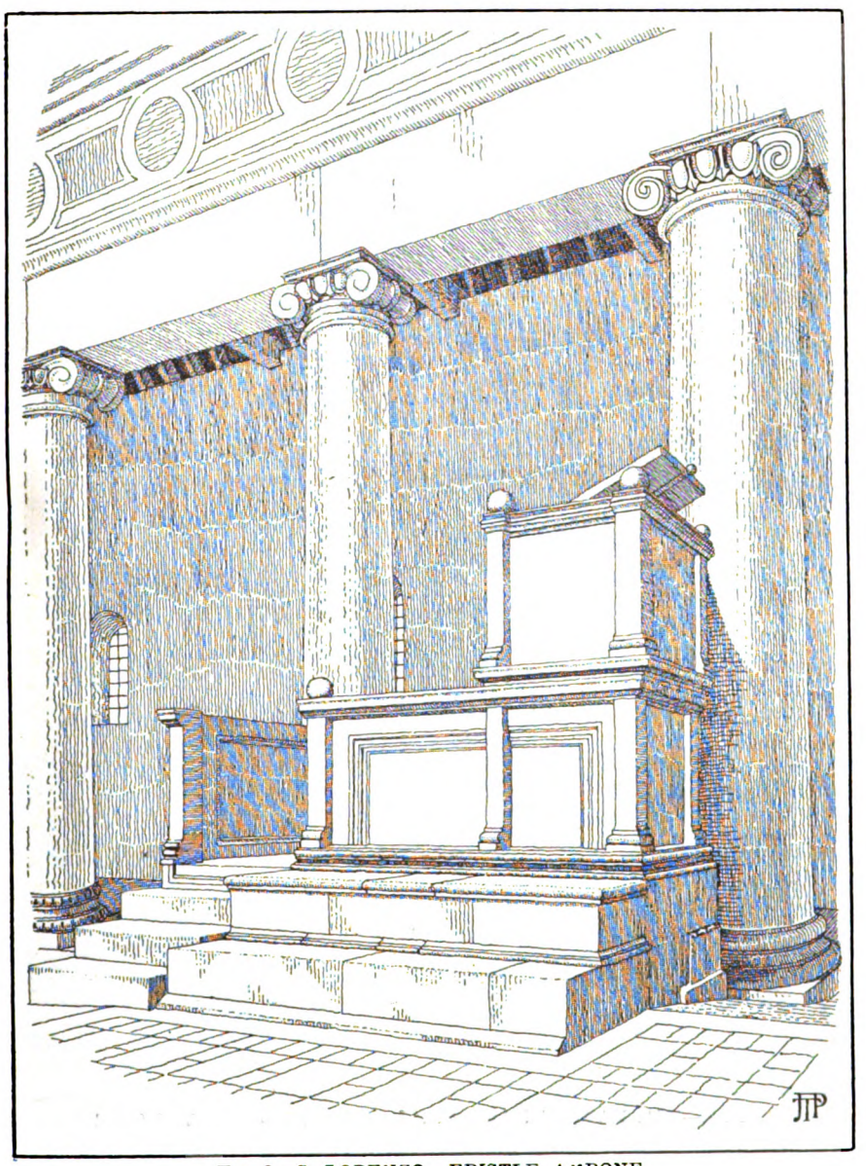

FIG. 6.—S. LORENZO.—EPISTLE AMBONE.

Digitized by Google

In S. Cesareo is an ambone made up of portions of an older one which much resembles those of Ara Coeli and has the same twisted marble and mosaic columns, and among its rich carving may be found the heads of sphinxes, the Lamb, and the Evangelistic symbols; and in SS. Nereo ed Achilleo are set up again portions of an ambone from S. Silvestro in Capite.

The last ambones to be erected in Rome were those of S. Pancrazio, and though they have been destroyed, drawings of them have been kept; and in the Lateran Museum is part of an inscription which they bore, running thus: LEGIT ' ATTENDAT 'AD ' QVID ' SACRA ' LECTIO ' TENDAT. They appear to have closely resembled those of Sta. Maria in Cosmedin, and had the bench of the Gospel ambone provided with arm-rests at each end in the form of couchant lions.

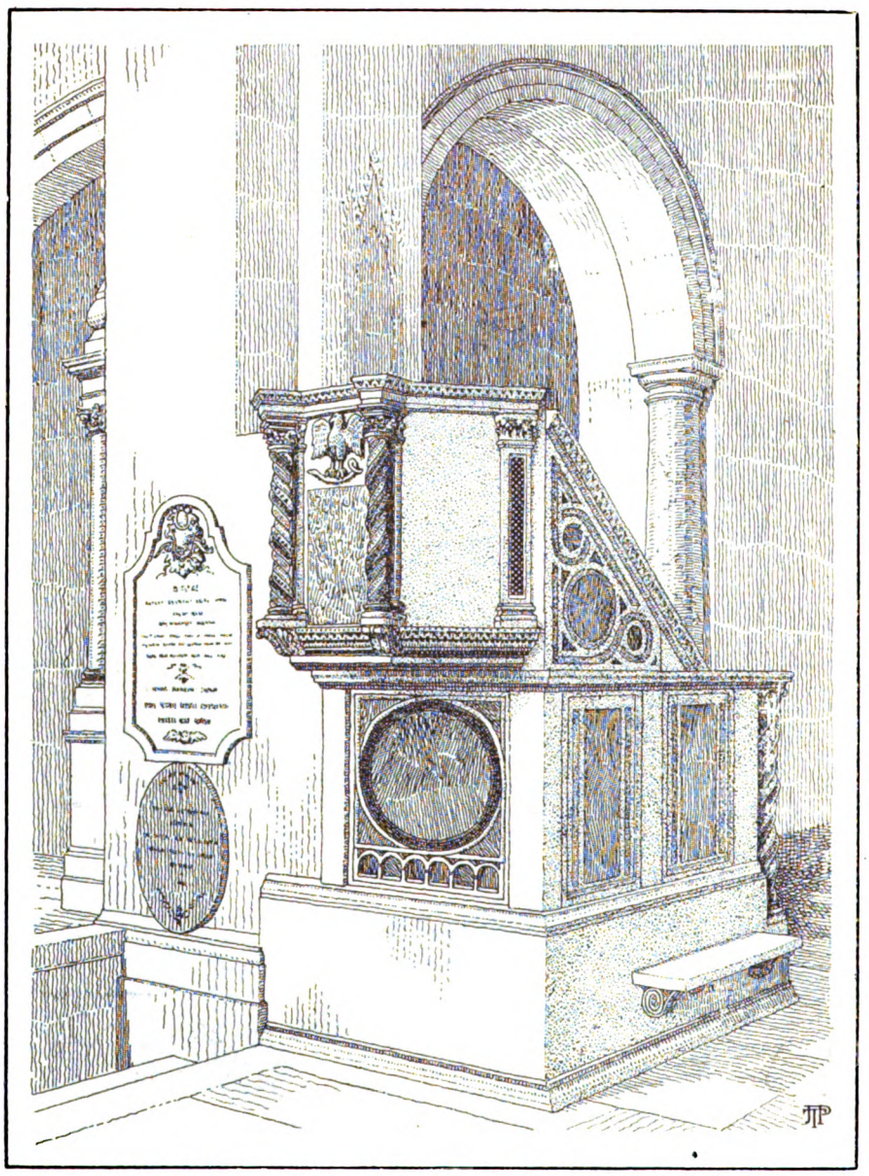

FIG. 7.—STA. MARIA IN ARA CŒLI.—AMBONE ON NORTH SIDE.

In the district round Rome several ambones are to be found, if not now in pairs, yet having been or intended to have been part of such an arrangement as already described. At S. Pietro, Albi (Alba Fucentia), there is a Gospel ambone extremely like that in Sta. Maria in Cosmedin which has preserved the names of its makers in the following inscription: CIVIS ' ROMAN ' DOCTISSIMVS ' ARTE ' IOHS ' CVI ' COLLEGE ' BONNVS ' ANDREAS ' DELVIT ' HONNVS ' HOC ' OPVS ' EXELSVM ' STRVSSERVNT ' MENTI ' PERITI ' NOBILIS ' FT ' PRVDENS ' ODERISIVS ' ABFVIT ' ABAS. At Fondi and Terracina are very beautiful ambones decorated with Cosmatesque mosaics, which appear to be the work of the same artists, but that at Fondi is alone inscribed, and thus: TABVLA ' MARMOREA ' VITREIS ' DISTINCTA ' DOCTORIS ' STVDIO ' SIC ' EST ' ERECTA ' IOANNIS ' ROMANO ' GENITI ' COGNOMINE ' NICOLAO. At Sta. Maria in Castello, Corneto, are two ambones, and that of the Gospel was made in 1208, the year of the consecration of the church, by Johannes, the son of Guttone, and last member of the celebrated mosaicist family of Ranuncius of whom there is any record; and in the sacristy of the Duomo of Tivoli some remains of a Cosmatesque ambone are preserved, but not enough to call for description.

Before leaving these Roman ambones more particular attention must be called to the arrangement of their desks, which was altogether departed from later in other parts of Italy to a degree which would seem to imply some modification in the ritual due to local or other causes. The position of the desk in the Epistle ambone on the side towards the altar never varied in Rome, but is rarely found elsewhere; while the desk for the Gradual, which occurs in S. Clemente, is never repeated in Rome, though it occasionally occurs elsewhere. In the Roman Gospel ambones no fixed desk for the book of the Gospel is ever found; and presumably in the city and its neighbourhood the ancient ceremonial was preserved at the Gospel reading, and the book was held, as aforetime, by a sub-deacon, whilst in other parts of Italy elaborate marble fixed desks were provided at the side of the ambone facing the Schola Cantorum.

There are a great many Paschal candlesticks in the Roman churches, besides the three already mentioned, no longer associated with the ambones to which they once formed important and picturesque adjuncts, and which have been lost. The earliest of the series may have been the ancient and beautiful candelabra, now preserved in the gallery of the Pio-Clementino in the Vatican, which were taken from the Basilica of Sant' Agnese on the Via Nomentina; while those of S. Pancrazio and SS. Nereo ed Achilleo may also be ancient candelabra adapted to their present

Digitized by Google

purpose. A fine candlestick of Bianco-e-Nero remains in Sta. Maria Maggiore, which belonged to the ambones destroyed by Domenico Fontana when he built the Cappella Sistina for Sixtus V. because they interfered with the view of his new building. In Sta. Maria in Trastevere is a spiral marble and mosaic candlestick of the thirteenth century, standing now to the ritual south of the altar; in SS. Cosma e Damiano is a similar one 6 ft. 7 in. high which may at one time have accompanied the ambone given

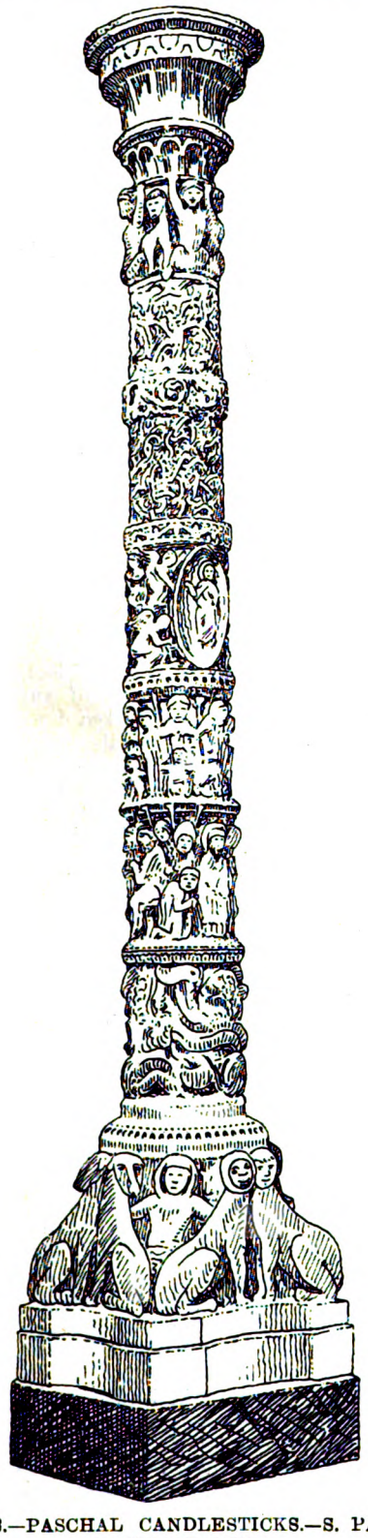

FIG. 8.—PASCHAL CANDLESTICKS.—S. PAOLO FUORI LE MURA.

to the church by Sergius I. about 695; in the cloister of the Lateran are some remains of a candlestick with fragments of the ambones made for the basilica by the same Laurencius and Jacobus who worked on those of Ara Coeli; while in Sta. Cecilia in Trastevere there is a fine spiral marble candlestick belonging to the ambones destroyed by Cardinal Paolo Sfondrato when he restored the church in 1599.

But by far the finest Paschal candlestick remaining in Rome is that in the basilica of S. Paul-beyond-the-Walls (Fig. 8), and though the ambones with which it was associated had been destroyed long before, this beautiful work of art had been spared and it survived the great fire. It is of white marble and stands some 16 ft. 6 in. in height, and is of late twelfth-century work except the sconce, which is a modern restoration. It bears two inscriptions: that on the astragal gives the name of the marble masons by whom it was made: EGO · NICOLAVS · DE · ANGELO · CVM · PETRO · BASSALECTO · HOC · OPVS · COMPLEVI; while on the base is this verse:

ARBOR · POMA · FERT · ARBORE · COLVMINA · GESTO
PORTO · LIBAMINA · NVNCIO · GAVDIA · SED · DIE · FESTO
SVRREXIT · CHRISTVS · NAM · TALIA · NVMERA · PRESTO.

SOME MODERN METHODS OF ARCH CALCULATION.*

THE arch is a form of structure which possesses great advantages from the standpoints of beauty and economy, and from the earliest times the arch has been used in all kinds of constructional work. In the present paper arches are not considered at all from the point of view of architectural styles or orders, but consideration is restricted to the calculation of the stresses in them.

The arch presents points of considerable difficulty from this point of view, and the resulting formulæ are elaborate. Some may contend that the formulæ are too elaborate, and that "simple practical rules" are just as good; the answer to such contention is that such simple rules would be welcomed if they really were as good. The difficulty is that unless simple rules are applicable over a wide range, and have been fully tested by scientific experiment, there is considerable danger in their use.

There is, unfortunately, among some practical engineers a strong antipathy to complicated formulæ—an antipathy which is usually stronger in proportion as the formulæ are not understood—but closer acquaintance with such formulæ, and some useful spadework in the form of the compilation of tables and diagrams, usually helps to dispel much of the dread. The primary reason of the difficulty in the determination of the stresses in arches arises from the fact that in mose cases the arch is what is called "a statically indeterminate structure," so that the forces acting upon the arch cannot be found by the ordinary laws of statics. Exactly similar difficulties arise in the case of stiffened suspension bridges, continuous beams, and slabs.

The stresses in an arch can be found as soon as we can find the magnitude and position of the reactions; these reactions R may be considered as compounded of vertical components V and horizontal thrusts H; if, as is usual, all the loads on the arch are vertical, the horizontal thrust H must be the same at each end.

We can then draw the line of pressure, linear arch, or equilibrium polygon (three alternative names for the same thing) for the given load system upon the arch.

Then by Eddy's theorem that "the bending moment at any point of an arch is equal to the product of the horizontal thrust into the vertical intercept between the centre line of the arch and the line of pressure," we have:

Bending moment at any point ($P = H\delta$).

If the line of pressure comes below the centre line of the arch, the upper surface or extrados of the arch will tend to become in tension; and if the line of pressure is above the centre line of the arch, the lower surface or intrados of the arch tends to become in tension.

Stresses in the arch.—To obtain the stresses in the arch we first find the thrust or normal pressure Q and the shearing force S at the point by resolving the thrust O_1 at the point under consideration along and perpendicular to the centre line of the arch at the given point.

Then if A is the area of the section and M_c, M_t the compression and tension moduli, we have:

$$\text{Maximum tension stress} = t = \frac{H\delta}{M_t} - \frac{Q}{A} \quad . \quad (1)$$

$$\text{Maximum compression stress} = c = \frac{H\delta}{M_c} - \frac{Q}{A} \quad . \quad (2)$$

$$\text{Mean shear stress} = s = \frac{S}{A} \quad . \quad (3)$$

There is, therefore, no difficulty whatever in the calculation of stresses in arches when once we know the horizontal thrust.

* Abstract of a Paper by Ewart S. Andrews, B.Sc., M.C.I., read at a meeting of the Concrete Institute.

Digitized by Google

Cases in which the horizontal thrust can be found without the elastic theory of arches. These are as follows:

1. Parabolic arch uniformly loaded over whole span:

$$H = \frac{w l^2}{8 v}$$

w = load per unit length,
l = span of arch,
v = rise of arch.

2. Parabolic arch with uniform load extending from an abutment to the centre—

$$H = \frac{3 w l^2}{16 v}$$

3. Arch of any shape provided with hinges. In this case the line of pressure can be drawn by the well-known graphical construction for making a link-polygon pass through any three given points; then the polar distance of the vector diagram gives the horizontal thrust desired.

This theory, to which the author's principal attention was given, is based upon a consideration of the deformations which an arch-rib obeying the ordinary laws of bending will receive. From these deformations we are able to calculate the horizontal thrusts.

Let δs represent a very short length between two points of an arch-rib, one end of which is considered as fixed relatively to the other end, and suppose that the bending moment along this very short length is B.

If E is the elastic (Young's modulus) and I the moment of inertia of the rib; it can be shown by the theory of beams that:

$\Delta\eta$ = vertical displacement of the end due to bending

$$= \sum_A^D \frac{B x \delta s}{E I} \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (1)$$

Δx = horizontal displacement of the end due to bending

$$= \sum_A^D \frac{B y \delta s}{E I} \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (2)$$

$\Delta\theta$ = angular change of tangent to rib at end

$$= \sum_A^D \frac{B \delta s}{E I} \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (3)$$

These are the general formulæ upon which all the special formulæ are based, and it should be noted in passing that they are the deformations due to bending only, and do not include those due to direct thrust; we will refer to the effect of the latter at a later stage.

These general formulæ were then applied to the most common special cases of rigid arches, viz.:

(1) Arches with two hinges or pin joints, *i.e.* two-pinned arches.

(2) Arches without hinges, *i.e.* fixed arches.

In a paper of this kind it was manifestly impossible to deal fully with a subject upon which several long text-books have been written, and it might very well be that many important points have been omitted. The author hoped, however, that a study of the paper would enable those who had not had the opportunity of a complete study of the arch theory in its more general aspects, to follow the fundamental relations upon which scientific calculations were based, and that their interest would be sufficiently aroused to encourage them to study the subject more fully.

MUNICIPAL ENGINEERING—PROSPECT AND RETROSPECT.*

By MR. NORMAN SCORGIE, M.I.C.E.

IT has become almost a customary rule in this Society that the President, on taking office, should attempt something in the nature of a general survey of the branch of engineering with which he is connected—its progress and its prospects. Of course the Society had often been fortunate in having Presidents able to handle broad issues in an illuminating form, but in his own case he was very conscious that a busy municipal practice in crowded North East London is not the ideal atmosphere in which one would prepare a presidential address of abstract contemplation.

In our time every branch of engineering has become noticeably more intensive, more complex, but municipal engineering has been peculiarly influenced by all the problems that arise from the endless efforts of man to conform to a social environment which is constantly changing, and, of late, changing so rapidly that it seems to have been revolutionised within the past five and thirty years.

In these changes municipal engineering has received less relief from specialisation than other branches. Admittedly the larger undertakings, mostly classed as municipal trading, are placed in special hands. The borough engineer is no longer called upon to design a town hall in his spare moments, or to manage a tramway system as a hobby; but this is a limitation on the amount of his work, and not on its range. He must still be architect enough to add to the town hall or adapt an old one to new uses; he may still have to install the tramway system, and will certainly be called on for inspiration in any difficulties; he may not have to manufacture gas or electricity, but he has to possess a knowledge of their manufacture; he must be something of a bacteriologist to deal with sewage; and more than a little of a lawyer in order to pick holes in the opinions of eminent counsel in matters of public-health law.

The real reason for the difference in this connection between municipal and other engineering seems to me to depend on the nature of the work itself, and the conditions of local government in this country.

Local government by small areas makes elaborate specialisation impossible in municipal engineering. The Town Council cannot specialise in house refuse, and refuse to scavenge or light the streets, and on the other hand it cannot afford, since its area is small, to pay adequate salaries to a number of separate experts. Therefore the municipal engineer is bound to be something of a Jack-of-all-trades. He must know something of everything and everything of something, be an opportunist, doing his best with the material ready to his hand, hampered on every side by limitations and vested interests. His plant is largely classed as unproductive. His results are increased public convenience and reduced death rate.

Public expenditure, both national and local, is constantly increasing, and one can see no sign of any check. Old-fashioned ideas of economy have broken down. The public is in revolt against the belief that the spending of money is always an evil to be avoided if possible. There is grave danger that for want of guidance they may incline—indeed they have inclined—to the opposite fallacy that all spending of money as long as it is on public objects is a good thing to be encouraged as much as possible.

The misleading division of municipal expenditure into productive and unproductive is one which the municipal engineer should combat, and in its place he should strive to set up an enlightened public opinion as to the real aims and productiveness of his work. It is public ignorance of the difference in the material results to be expected from it and other forms of engineering which condemns him on the one hand to the use of obsolete devices in the interests of so-called economy, and on the other hand to embark on unsound schemes for the sake of an immediate profit or saving.

In recent years it has probably been of some advantage to the profession as a whole that one branch of it should have remained exempt from the increase of specialisation, because specialisation always produces a temporary decline in status. We are apt to value a thing by the price it will fetch, and a man by the salary or fees he can command, and if the work of an engineering post, formerly held by one man, is split up among several, it is clear that the individual salaries will be smaller and the status of the holders to some extent less than that of their predecessor. It is only a temporary depression for two reasons: first, if the change is a good one it will lead to such an increase of business that the separate appointments will eventually be worth more than the original one; secondly, and more important, in the case of those firms and public authorities whose work is largely concerned with engineering the importance of engineering knowledge in high places is becoming more and more recognised, so that while the purely professional work of a chief engineer may be abolished by the division of it among independent departmental engineers, yet the appointment of an engineer as chief executive officer is becoming usual.

The status of engineering is not permanently at the mercy of anything except the merit of the engineer. One simple safeguard we should have, such as every profession has found necessary for its protection against charlatans—namely, that no one who is not properly qualified should be allowed to call himself an engineer. Beyond that I think

* Abstracts from the Inaugural Address of the President of the Society of Engineers (Incorporated), Mr. Norman Scorgie, M.I.C.E., delivered on February 1.

Digitized by Google

we could work out our own salvation without the aid of many shibboleths. It may be argued that those professions which by common consent enjoy the highest prestige, such as medicine and law, are protected by elaborate codes of etiquette and internal discipline; but it should be remembered that those codes are late products in professional history. Whatever we may think of their value, they are the devices of a professional class to preserve a position which it has already won on its merits and without their assistance.

There are some grounds for suggesting that the exceptional breadth of municipal engineering may pass away and give place to specialisation to some extent. The co-operation of local authorities for particular purposes has often been encouraged by Parliament. There are (excluding the main-drainage system of London) forty-two joint sewerage boards acting for about 110 local authorities, including such important towns as Birmingham and Brighton.

In Greater London there are about forty men holding chief appointments as municipal engineers, in no way distinguished from one another or from those drawing similar salaries in other parts of the country. Yet their collective cost is greater than would seem necessary for London compared with provincial towns on a basis of population, size, rateable value, or even traffic. It is obvious that forty men of similar ability, paid similar salaries, but each a specialist in one class of work and in charge of that work over the whole of London would be very much more efficient in themselves at no increase of cost to the public. Specialised efficiency is not popular at the moment, because of its supposed identification with German methods; and to say that they would be more efficient in themselves does not prove their ultimate value under popular control. London suffers from an extraordinary lack of any sense of corporate unity, and, in the absence of that cementing force, it is most probable that local areas under the control of local Councils, areas small enough to be conscious of physical unity in default of anything better, are the best form of government.

Historically the development of London government might have been very different. The creation of a directly elected County Council has unfortunately only produced twenty-eight examples of the jealousies that commonly exist between any County Council and the non-county boroughs within the county. Moreover, it is an inexpansive system. Independent authorities outside a federal scheme will often in self-interest elect to come in, but it is impossible to imagine that the boroughs outside the County of London will ever of their own free will come under the control of an external London County Council. Their opposition may postpone the whole question ten or even twenty years, but sooner or later London government will have to be dealt with again, and most probably the next time on federal lines. Federation itself, of course, would not necessarily produce a great amount of specialisation in municipal engineering, but since it almost always leads to closer union it would probably be a step in that direction.

Municipal federation is also becoming a possibility in other parts of England; for example, in the Birmingham district and in the Manchester district—indeed, in the latter it is almost an issue of current municipal politics.

But before these tentative influences arising from unity of local interests can affect this branch of the profession, it is likely that another influence, new within the last decade, and arising from a unity of interest all over the country, may have a profound effect upon the problem of the road. This includes not only the question of road construction and maintenance, but the whole problem of transport, from town planning to traffic regulation.

For one reason or another road maintenance in this country is a duty which is very unevenly performed, and a burden which is very unevenly distributed under present conditions. The Departmental Committee on Highways (1903) found the roads of England and Wales in the hands of some 1,900 local authorities pursuing widely divergent policies. The recommendations of the Committee, which would have introduced a modified nationalisation by government grants administered through county road boards for the whole of a geographical county (including county boroughs within it), have remained a dead letter through the apathy of the Local Government Board. But with the growing importance of the roads, and their increasing cost, which is now about £15,000,000 a year and greater than that of any other country, it is inconceivable that any control can long be suffered to remain in the hands, for example, of rural district councils who, in some cases, appoint as their surveyors unqualified persons at salaries as low as £40 a year.

The Royal Commission on London Traffic recommended a central traffic board for the whole of the London area, and a reform is none the less a reform because it is overdue.

The creation of the Road Board in 1910 is another conspicuous advance in the policy of centralisation, although for the present limited to financial assistance and advisory propaganda.

Finally, the Government is committed to a policy of fostering co-ordination in regard to town-planning schemes, and from fostering to compelling is a short step in twentieth-century political opinion.

All these are reasons for thinking that a very profound change in the position of the municipal engineer may be near at hand. He began as a surveyor of highways, he may likely end as such. If the roads are taken from him the greater part of his daily engineering work will go with them. It is not really a question of taking some roads and leaving others. In urban areas the distinction between the county and non-county road has generally been rather a matter of financial juggling than substantial fact, and what substance there was has vanished with the coming of the motor.

In rural areas the distinction between the county main roads and the district roads is not perhaps so obsolete, but it is in process of decay.

The direct influence of the war on all forms of engineering will be very great, and some of it is already apparent—for example, the vital importance of standardisation in all material likely to be needed for military purposes. But much greater than the direct effect is going to be the indirect effect on our national temperament. It is one of the ironies of the situation that a war against German militarism is educating us to the importance of the military aspect; that in revolt against soulless German ideals of efficiency we are really developing our own ideal of national efficiency, of local and individual sacrifice to the common good, alien to the English character hitherto, which has placed the liberty of the subject higher than the general interest. It is due to this trait in the English character and to our freedom from foreign invasion that England is pre-eminently the country of local government. We have taken an institution to our hearts and endured any amount of incompetence, of corruption even, as long as it was local. In the future possibly the accent may be shifted and we shall insist on good government as the first condition of survival.

The highway system also has its history in cycles. The Roman roads must have been under the State, but mediæval England reverted to local control. Then the coming of the turnpike and the influence of Telford and Macadam seemed on the point of making them national again, when the rise of the railway put an end to it all and revived the despised parish system. To-day we seem once more on the eve of nationalisation; but if some extraordinary improvement in the safety and convenience of the aeroplane should suddenly relegate the Road Board and motor-cars into the obsolete, it would be no more striking and unexpected than when the locomotive bankrupted the turnpike trusts and abolished the stage coach.

The early history of the road is obscure. A "highway" meant in mediæval days a right of passage and not a special surface. The obligation to maintain the way unimpeded was probably on the adjacent landowners, but any improvements in construction were due not to the law, but to the benevolence of pious founders or religious houses. A considerable decline in the amount of travelling seems to have coincided with the decay of manorial rights and monastic wealth, so that the roads fell on evil days; until an Act was passed in 1555 which for the first time put a statutory liability on the parish as a whole, and for 300 years that policy remained the basis of road maintenance. In that Act originates the Surveyor of Highways, chosen by the parish to serve gratuitously for a year. Highway rates were sometimes attempted from the seventeenth century onwards—Hackney had a 6*d*. rate in 1699—but until the end the compulsory labour and teams which the surveyor was authorised to requisition remained the main resource of parochial road administration.

The toll system, which originated in three toll gates being authorised on a portion of the North Road in 1663 to provide a fund for its repair, came to the rescue of English roads. The parish and the county justices were both pased over, and Parliament established thousands of Turnpike Trusts from about 1706 onwards, which, although

Digitized by Google

expressed to be temporary, all became permanent local authorities.

With the beginning of the nineteenth century the Government and public opinion began to take the road question seriously.

The urban sanitary authority had come in with the Public Health Act of 1848—the real starting point of modern municipal engineering—which had made the Local Board of Health (as it was then called) the highway authority for all roads in its district; and by this time there were about 1,000 of them (including municipal boroughs). Elsewhere the rural parishes were being largely superseded by the Highway Boards.

The Royal Commission on Sanitation (1869) recommended the division of all England into sanitary areas, and accepted the poor-law union of the county or the parish as the rural area. This was adopted in the great Public Health Act of 1875, and the Highway Act of 1878 provided that new highway districts should coincide with the rural sanitary districts; but (apart from old ones which did not) there were in 1891 still 6,501 parishes separately administering their own highways, so that the Local Government Act, 1894, which abolished both highway districts and highway parishes in favour of rural sanitary districts, had a great work to do. On account of difficulties in adjusting areas, the Act provided for postponement where necessary, and it was not until 1899 that the last surviving district and parish were each merged.

The reason for the small part the municipal borough has played in the earlier history of municipal engineering is bound up in our forefathers' conception of what a borough was, and their distinctly dirty manner of living. Just as a highway was not a piece of land but a right of way, so a borough to the mediæval mind meant not so much the place as the privilege; chiefly the privilege of exemption from the jurisdiction of the lord of the manor or the sheriff of the county. It was itself a bundle of jurisdictions often over different and very indefinite areas, and one of its most important privileges—the franchise—was personal and had no territorial limit.

Although in the fifteenth and sixteenth centuries the best of the corporations were faithfully fulfilling their corporate obligations in such things as provision of work for the unemployed, yet it is not to be expected, in spite of some rather well-sounding officials we meet with in the records—Street Keepers, Street Wardens, Sweepers of Streets, and (best of all) in Rochester "Scavenger to gather the money" with humbler subordinates to look after the dirt—in a time when highways were of small account, that corporations should be much concerned to improve them. For the rest, our ancestors were not morbidly anxious about drains, and it was not until after the lesson of the cholera epidemic of 1847 that the general public-health laws began.

Yet populous and enlightened towns must have wanted to cleanse and light, to drain and improve their streets long before 1848. They did, and from about 1750 onwards there is a continuous stream of special Acts of Parliament to enable particular towns to cope with their needs.

In a few cases the powers were conferred on the Corporation, or at any rate on commissioners controlled by the Corporation. Liverpool is a striking example of a Corporation having a very broad idea of its proper sphere of action in pre-reform days. It was continually securing local Acts, and was the first provincial Corporation to get one for lighting, cleansing, and watching its streets. It constructed "the first docks ever built in England," and by 1825 it had spent two millions sterling on them. It spent also large sums on street widenings, free schools, and public baths, and it even built and endowed churches. Most extraordinary of all (although outside our subject), it maintained a London office, and it lent money to its citizens.

In most cases, however, the new powers were being granted at a time when the common councils were declining in prestige, and Parliament preferred to confer them on new statutory bodies. These *ad hoc* authorities—Commissioners of Sewers, Paving, Streets, Police, for example—with their varying constitutions and powers, but all of them doing work which the Corporation ought to have been doing, are the principal feature of municipal history in the hundred years before the reform of the Corporations.

The records which most Corporations possess from a very early date (and which some public-spirited ones are editing) are not only interesting, but often important in modern practice. Since the municipal Corporations were reformed the Commissions have been dissolved and their powers transferred to the Town Council, but the majority of the local Acts, whether obtained by the old Corporations or by Commissioners, are still in force. They are further examples of the legal complexity which attends the work of a municipal engineer. To all the modern tastes and abilities which are the qualifications for an ideal borough engineer, it looks as though we should add one other to complete his halo—he must be something of an antiquarian.

LEEDS AND WEST YORKSHIRE ARCHITECTURAL SOCIETY.

A GENERAL meeting of the above Society was held at the Leeds Institute, Cookridge Street, on Thursday evening, January 28. The President (Mr. G. Frederick Bowman) occupied the chair, and Mr. Thos. W. Thornton (President of the Leeds Photographic Society) gave a lantern lecture on "The Story of Fountains Abbey."

The lecturer traced the history of the Abbey from the beginning of its building in the year 1132, and told of the hardships which beset the Cistercian monks in the task of completing such a large undertaking. They found labour difficult to obtain and building material scarce, the stone being finally obtained from Pateley Bridge. These monks, possessed as they were with a fine spirit of determination, toiled through the years for "the Greater Glory of God" towards the completion of these "poems in stone," which are now the admiration of the civilised world.

Mr. Thornton gave a good description of the life of a monk, and explained that although the monk always lived very well, he was in no way a gourmand.

The lecture, being free from technicality, was highly appreciated by the members present, and a vote of thanks was proposed by the Vice-President, Mr. F. F. Walsh, F.S.I., seconded by Mr. A. Willetts and heartily adopted.

ART IN LONDON.

MODERN MASTERS OF ETCHING.

THE Leicester Galleries are, at this time of writing, the home of an interesting collection of etchings and drypoints, the work of modern masters; and there is much that is worthy of close inspection and the highest appreciation. Second to none is the output of Sir F. Seymour Haden, whose "Sunset on Thames," "The Towing-path," and "Sunset in Ireland" are admirable productions, the first-named breathing an atmosphere of poetry; "Greenwich," by the same artist, is of a lower order, with an untidy, unrealistic sky. Mr. Muirhead Bone's "Rainy Night, Rome," and "Walberswick Ferry" are arresting in the perfection of their treatment, the atmospheric effects being most sympathetically rendered. Mr. Martin Hardie's "Place des Cordeliers, Falaise," is picturesque, with an entire lack of any meretricious quality.

It is a pity when artists waste their labour upon unworthy subjects, for it is with landscapes, as with people, that there are records and histories which do not call for perpetuation; "Tall Houses at Mentone" is a case in point, where Mr. Warlow has rendered with fidelity what he saw before him. Whistler could also fritter his energies upon poor subjects, but as he knew how to imbue his work with a poetry which emanated from his inner consciousness, one is often carried away from better judgment in sheer delight. "The Mill," by this artist, is a compelling sketch, and "San Biagio" is a delightful study, light but yet forceful; "Drury Lane" is one of Mr. Whistler's lightning sketches, touched in with his own pleasant *légèreté*, but his "Limehouse" is not at all typical. M. Anders Zorn's hatching is much too coarse and insistent in "The Precipice" and "Cercles d'Eau"; in the latter the reflection of the nude figure in the water is egregiously exaggerated. We see better work by this artist in the portrait study "Frida."

Samuel Palmer's "The Early Ploughman" is every effective in its virility and contrasts, and Millet's "Man with Wheelbarrow" calls for notice. Here, however, we observe an insufficiency of atmospheric light beyond the opening in the wall, causing the appearance of the barrow being driven against a shallow recess instead of finding a clear passage. Two works possess plastic effects to which attention should be directed—namely, M. Jules Jacquemart's "Le Christ à la Colonne" and Mr. E. Blampied's "Restless Horse," each in its way a gem, though we must confess that the horse's tail, while doubtless helping to convey the idea of restless-

Digitized by Google

ness, is probably exaggerated in its wildness. "Backing the Hay-cart," by the same artist, is also full of action, and is excellent in its technique. Mention must be made of Mr. Francis Dodd's "Church of St. George the Martyr," a fine drawing with the values well defined; the same artist shows good technique in "On the Lawn," but the composition is poor.

Mr. Malcolm Osborne's "Bannockburn and Stirling Castle" is notable for its breadth and atmosphere; and for their manifold good qualities attention must be directed to M. Béjot's "Le Pont des Arts, Paris," and Mr. Axel Haig's "Amiens," but the latter is deficient in the desirable quality of mystery; Mr. Albany Howarth's "Porte St. Pierre, Auxerre," is just how an architectural tit-bit should be portrayed.

The last two works for which we can find space for notice (though there is much else worthy of inspection) are Mr. Hugh Blaker's "Patrick" and M. Edgar Chahine's "Louise France," both excellently modelled and giving the effect of faithful portraiture.

PORTRAIT PAINTING.*

THE TECHNIQUE OF THE GREAT MASTERS.

By THE HON. JOHN COLLIER.

IT is very difficult to learn anything about the technique of the Great Masters of portrait painting. One has plenty of anecdotes about their habits and manners (which were often somewhat unsatisfactory), but hardly anyone condescends to tell us how they painted.

It is possible, however, to pick up a hint here and there, and something may be learned by a mere inspection of their works. At any rate, in the course of my studies I have come across some interesting details, and I have formed certain opinions, which I propose to put forward for what they are worth.

We will not go back to the ancients. No doubt excellent portraits were painted in classical times, but we do not know enough about them to discuss them with any profit.

I will also pass over the Middle Ages, and come at once to the Great Masters of the Renaissance. Of these one of the greatest is Holbein, who in manner is still somewhat mediæval, although in date he belongs to the early Renaissance. His portraiture is apt to be a little stiff and somewhat lacking in charm, but, having made these reservations, we can give it our profound admiration. His drawing and modelling are extraordinarily subtle, and his grasp of character prodigious. He seems to give one more insight into his sitter than almost any other portrait painter—even the greatest. As for his method, there is, unfortunately, no documentary evidence; we must find it out for ourselves. He made a very careful preliminary drawing on paper, which was transferred by tracing to the canvas or panel, generally the latter. He did not depart from this drawing in any essential, although he often slightly improved on it. Many of these drawings have come down to us—they are of extraordinary delicacy and accuracy. Having made this tracing, he surrounded all the important contours with a very thin dark line of paint. The subsequent work never entirely obliterated this thin line. It can only be seen by minute inspection, but it is to be found in all his pictures. He probably began with a light underpainting in monochrome, as was the practice of the Van Eycks, but of this we cannot be certain. The paint was always thin and smooth, and highly finished. All the details, whether of dress or background, are rendered with the utmost care. Any pattern is given in its completeness; he never adopts the practice of later painters of indicating pattern where the light catches it, and losing it in the shadows. It is always there, although so delicately rendered that it seems lost in places. There is no focussing; the head is not thrown into artificial relief by blurring or suppressing the accessories, and yet everything takes its place. The head is so lifelike that it is never overpowered by the surrounding detail. As you fix your eye on any part of the picture you can see it sharply defined (as you do in Nature), but you are never worried by this, as there is no over-emphasis. You are not forced to look at comparatively unimportant details, but you can do so if you like, and find them true to life.

One consequence of this is that the picture looks right from almost any distance. It can be peered into quite closely or viewed as a whole from some way off. In neither case does it suffer.

I rather dwell on this, as it is a characteristic of all early work. It was only the later painters who invented a sort of shorthand so that the picture can only be properly seen at a certain distance. When looked at nearer than this distance it seems merely a mass of blurs and smears. This has a charm of its own, for it looks, and is, so masterly. The effect seems to be produced by such strange and inadequate means. But to me there is great pleasure in being able to look closely into a picture and to enjoy the delicacy and precision of its detail.

The freer and more summary method is to be seen at its best in the later works of Velasquez and of Rembrandt. These have to be looked at from a considerable, but never from an excessive, distance. In the case of large works, such as "Las Meninas," it is about the distance at which one would naturally stand in order to take in the whole picture at a glance. Many modern artists go much further than this. Even works of a moderate size have to be looked at from the end of a large gallery to seem at all coherent, and even then—but I will not pursue this somewhat painful subject.

To return to the earlier masters, it is only when we get to Titian that we find any variety of texture and any play of brush work, and even with him it is not very marked. Titian's portraits are very elaborate, but there is a certain suppression of detail and a greater breadth of effect than is found in any earlier work. Titian's pictures seem to have been built up by a very slow process, and his portraits are probably no exception to this rule.

Here is an account of his method. It has come down to us through Boschini, who knew the younger Palma, whose father had received instruction from Titian himself. The pictures were first laid in very solidly with only four colours, a red earth (possibly Venetian red), with white, black, and yellow (the yellow was probably yellow ochre). There was no blue; but black and white make a bluish grey, which would be sufficient to indicate this colour in the first painting.

Boschini speaks of four pencillings which were done in this way, and then the picture was put aside for several months. When he took it up again he first amended and corrected all the forms. He then finished very laboriously with continual glazings, and also with rubbings of opaque colour frequently applied with the finger instead of with the brush. "In this way he gradually gave to his works that bloom and perfection of rich surface and that fulness of colour in which his paintings surpass all others," as Boschini justly observes. The essential point about this method is that it is so indirect. The painting was first executed in very dull colours, and the full effect was only arrived at by a protracted series of glazings and scumblings. In one form or another this indirect method was a very favourite one with the older masters, and indeed with many later ones. Sir Joshua Reynolds followed fairly closely on Titian's method, except that he speeded it up a good deal, and his first paintings were with a still more restricted palette; and up to quite modern times some kind of underpainting approaching to a monochrome has been very generally adopted. But of late this indirect method of painting has been entirely abandoned. I do not know any modern painter who practises it.

It seems rather absurd to criticise adversely a method which, in Titian's hands, has given us some of the finest paintings which the world has ever seen; but I certainly think that for portraiture a more direct technique is preferable, and, indeed, this preliminary underpainting was by no means universal even with the old masters. I do not believe that either Velasquez or Rembrandt made any approach to a monochrome preparation.

We have seen that Titian was the first great painter to make much use of texture and of varying surface in his painting. Before his time the surface was uniformly smooth. It is quite possible to suggest a rough texture on a smooth surface, as we can see any day in photography: even a smooth shiny photograph can perfectly represent a wrinkled skin or a rough-cast wall, and what a photograph can do a picture can do, but it involves a great deal of labour. In skilful hands a certain roughness of paint can represent a rough surface as truly as, and much more expeditiously than, the minute alternations of light and shade which convey the appearance of texture in a photograph or

* A lecture delivered on January 27 before the Royal Society of Arts.

Digitized by Google

in a smooth painting. That all varieties of surface can be represented by appropriate brush work was most fully realised in the later work of Rembrandt. Since then many artists have essayed it, but none with his mastery. Velasquez had also a great power of brush work, but in this he did not equal Rembrandt, though in many other qualities of portraiture I think he surpassed him. I hold that Velasquez and Rembrandt carried the art of portraiture—at least, male portraiture—to the highest level it has ever attained. They were both so indifferent to female beauty that their portraits of women, however masterly, are quite lacking in that essential charm which is given so wonderfully by the great English school of the eighteenth century.

I have tried hard to discover any authentic testimony as to the methods of Velasquez; but, as usual, we have to rely more on inspection of his works than on any contemporary records.

Señor de Beruete, a distinguished Spanish painter, who made a lifelong study of Velasquez and has written an admirable book upon him, is the best authority I know on the technical side. According to him, Velasquez painted on a red priming in his early work; this gradually changed to a neutral grey in his later style. The impasto of this priming becomes less and less—towards the end it only just covers the canvas, the grain of which is moderately fine even in big pictures. In the "Bacchus" the priming was reddish. There are places, especially round the figures and accessories, where this priming has never been covered; so, instead of working his figures into the background, each part was painted separately, carefully following the drawing. In his later period he became presbyopic, so, not being able to see close, he had to get further and further away from his canvas, which made his execution more summary. In his latest pictures he used very fluid colours, in some places only floated on, as in water-colours, and there is no impasto save in the head and hands. So far I have followed Señor de Beruete, but I disagree with this dictum. Velasquez used impasto freely enough in the draperies, even in his latest style. I also disagree as to the brushes used by Velasquez. De Beruete says that he always used round brushes, and that there is nothing in his pictures to indicate that he ever used flat ones. I am quite convinced that there are many broad sweeping passages in the master's work that can only be rendered by broad flat brushes. It is interesting to note that Palomino, who wrote only sixty-four years after the death of Velasquez, states that he painted the portrait of Admiral Pulido y Pareja with exceptionally long brushes, in order to get more vigour and relief; De Beruete entirely rejects this testimony—I think on insufficient grounds. He also denies the authenticity of the portrait of the admiral in our National Gallery, and ascribes it to Mazo. Here, again, I entirely disagree with him. It is a magnificent portrait, well worthy of Velasquez, and very much above the high-water mark of Mazo. With regard to the long brushes, it is true that they must have been abandoned by the time he painted "Las Meninas," a much later work. This picture is an invaluable document as to the practice of Velasquez. He is standing up to his easel with quite a small round palette in his hand, and the brushes are round and of very moderate dimensions; but then he is probably supposed to be just putting the finishing touches to his picture. It is absurd to imagine that he would paint the broader passages of such an enormous canvas with such little brushes. The colours on the palette are given by De Beruete as vermilion, white, terre de Seville, and carmine; and there are indications of three or four sombre tones, which may be blacks or browns. There seems no trace of the blue and yellow that he must have often used.

The room is a big one, very lofty, and lighted from the side by high narrow windows. As he was painting the little princess and the maids of honour, it has been supposed that this was not his usual studio, but merely a room in the palace used for the occasion. I think myself it was very likely his ordinary painting room; it seems well adapted for the purpose, and there are many pictures on the walls such as artists accumulate in their studios. In any case, this is the room in which he painted what was perhaps his masterpiece. At the risk of wandering a little from my immediate subject, I may mention that one of the great qualities of this picture is that for the first time in art an effort has been made—and an extraordinarily successful one—to give absolute truth of light and shade; and more than that, to give the effect of atmosphere that pervades all natural scenes. For the first time in art a room has been made to look like a real room, with the figures in it bathed in a real atmosphere and lit up with the light and shade of Nature.

This is a very extraordinary achievement. Some of the Dutch painters, such as De Hoog and Vermeer, have given much the same impression of truth to Nature in the relation of figures to their background; but it is a very rare quality in painting, and no one has done it quite so well as Velasquez. It is occasionally essayed in modern times, but rarely with complete success. The best example that I know is "A Venetian Interior," by Sargent. This is a very wonderful work, but by the side of "Las Meninas" it is a little lacking in simplicity. There is too much virtuosity in the touch, and altogether it is a little too brilliantly dexterous. In looking at it one's first thought is, How amazingly clever! One does not say that in front of "Las Meninas."

To return to the actual method of painting employed by Velasquez. In his early period the execution was precise and very hard. He was fond of dark shadows and clear-cut outlines. In the middle period the paint was put on very solidly and simply, but with much greater freedom; the execution could not be called hard, but was definite and precise. In the third period it was freer still; rather vaguer and softer, and much more subtle. In this later period the paint was put on quite thinly in the shadows, so that the texture of the canvas can be seen through—in places it looks hardly more than a slight modification of the thin grey priming. But however thin the shadows were, they were not painted with transparent colour. It was opaque colour, but very thin and liquid. The lights, especially in the flesh, were solid. The whole seems floated on to the canvas very delicately and subtly, but with an extraordinary economy of labour. At the end certain accents, such as the dark of the eyes or the shadow of the nostrils, were put on with the scratchy touches of a small brush, and the painting was finished—at least, so it looks at the proper distance. Seen near it is just a few soft smears and a dark scratch or two. But then these smears are so wonderfully true in tone and in form. When one has achieved a mastery such as that painting seems surprisingly easy.

Velasquez was not afraid of making alterations when necessary; but one of the characteristics of his work seems the sureness of his intention. His pictures are conceived, as a whole, from the very beginning, and yet he made no studies or preliminary sketches—at least, practically none have come down to us. Through all the three periods his colouring remains simple and subdued, but extraordinarily harmonious. It is mostly in the key of grey.

I think this is all that can be said with any safety as to the methods of Velasquez. The case of Rembrandt is still more difficult. He seems to have worked in a studio with a very small window, so as to get the powerful effects of shadow in which he delighted. His chiaroscuro is far more artificial than that of Velasquez. It is extraordinarily skilful, but to me it is too arbitrary to be quite satisfactory. Again, the warmth of his colouring is unnatural, although very pleasing. He was a great colourist, but somewhat lacking in variety. He affects almost exclusively the browns, reds, and yellows, but within this limited range his mastery is supreme. The extraordinary success of Rembrandt in the key of brown has led many artists to imitate him in their colour-schemes, but mostly with disastrous results. For most painters the greys of Velasquez are much safer, besides having the advantage of being truer to Nature.

The early work of Rembrandt is careful and precise, but it is not hard like that of Velasquez. The execution is smooth, and there is no attempt to render texture by brush work. The best example of this early period is the celebrated "Lesson of Anatomy," at the Hague, painted when he was twenty-six—an extraordinary masterpiece for so young a man.

In spite of the size of the picture the execution is so delicate that the hairs at the end of a moustache are drawn separately with a fine brush, and yet the effect is broad and forcible. This force is gained by a powerful effect of light and shade, and by a certain breadth of treatment, but not by any vigour of handling. The hands in this early work are particularly good. In his later style Rembrandt was apt to be careless in this respect.

In his middle period, the beginning of which is marked by the so-called "Night Watch," the most amazing of all his pictures, his execution has become much more masterly. Dr. Bode speaks of a soft buttery impasto as characteristic of the works from about 1645 to 1659, and in contrast describes the painting of the heads in "The Syndics" of

1661 as loose and granular, and with some exceptions I think this can be taken as fairly descriptive of the methods of his middle and latest periods.

It is in this third or latest period that Rembrandt's full mastery over the resources of oil paint is achieved. I am convinced that he then painted on a dark ground; the paint was put on thickly and so manipulated with stiff brushes as to give any variety of texture he required. He would sometimes dig right through the paint to the ground below. In this manipulation of the actual texture of the paint Rembrandt is supreme—no one has ever done it so well before or since.

The portrait of an old man in our National Gallery, painted in 1659, is a fine example of this vigorous and masterly brush work.

There is another Dutch painter, Franz Hals, whose brush work has been extolled almost as much as Rembrandt's. It is certainly supremely dexterous, but it is not so really masterly. Rembrandt, by the texture of his paint, actually renders the wrinkled skin of old age. Hals does not attempt to do this. He merely excites our wonder by showing with how few touches he can produce the illusion of a finished painting. The method of Hals appears at first sight to be extraordinarily simple. He seems to be more a draughtsman than a painter. The shadows are put in with clear, decided touches, and modelling is less thought of apparently than the accurate placing of the accents which mark the features. The hair is painted with great coarse strokes, like an enlarged drawing. Then the colour of the heads is mostly poor, hardly more than one even tone with brown or black shadows. He seems to have kept all his fine colouring, and it was sometimes very fine, for his costumes and accessories. At least, this is how I used to think of Hals' work, but of late I have begun to appreciate it better, and to find all sorts of very delicate subtleties of modelling, and even of colour, where before I had only been struck by a certain coarseness of effect. And I have lately come across a contemporary account of his work which shows that the method was not quite as simple and as straightforward as it seems.

According to Houbraken, Van Dyck said of Hals: "He had never known anyone who had such power over his brush that after laying on the portrait he could render the important touches in the lights and shades and in the right place with one stroke of the brush without blending or changing; the first stage in his portraits had the effect of an indeterminate blur, then followed the broad brush strokes as if the master said, 'Now the painter's handwriting must come in.'"

This sheds a flood of light on the technique of Hals. I certainly never suspected that the first stage of his portraits resulted in an indeterminate blur, but I can understand how valuable this preparation for the final decided touches would be. No doubt it was this that gave the subtlety, whilst the firm touches gave the dash and vigour.

This is how I conceive Hals to have painted. He used a smoothish canvas with a light yellow-brown priming. One can see this priming in the head of a man at the National Gallery. It forms the ground colour of the hair. He, no doubt, drew in his picture carefully but very broadly. Then came the indeterminate blur which gave the subtle modelling with the merest indication of the features. This was left to dry. Then at the final sitting a very thin coat of the flesh colour was passed over the whole face, broadening and simplifying but not obliterating the modelling given by the blur. Then on the wet paint came the decided touches—"the handwriting"—which gave with the fewest possible strokes the drawing of the features and the matchless vivacity of the expression.

I have dwelt so much on the method of Hals as it is the foundation of what is best in modern portraiture. Mr. Sargent's work is curiously reminiscent of Hals. He has the same admirable vivacity of pose and of expression; the same resolute determination that the finished picture shall have all the freshness of a sketch; the same apparent economy of means, the perfection of the few touches that give all the illusion of elaborate finish when seen at the proper distance.

Of course, in one branch of his art, Mr. Sargent has far excelled his master—Hals seldom painted women; when he did they had no charm. Mr. Sargent has painted many beautiful women very beautifully. Nearly all that is most vital in modern portraiture is derived from Mr. Sargent, and through him from Franz Hals.

In some ways I regret that it should be so. It is a fine method, though not, I think, the very finest. At any rate, it is a pity that so many other fine methods should be unrepresented in modern art. For instance, I have been longing for some time for a movement of "back to Holbein." I can imagine no more wholesome corrective of the modern tendency to sloppiness and haste, but I regret to say that I can see no sign of it.

Rembrandt is too elusive to be followed with any profit, but the methods of Velasquez are so simple that I think they might be imitated with some hope of success.

Then there is another Dutch painter who produced masterpieces by sheer force of competent industry. There was no secret about the method of Van der Helst. It just consisted in painting everything as well as he possibly could in an absolutely straightforward manner. Surely some of us could do the same, if we would but take the trouble! We should have to take a great deal, for there are no short cuts in the laborious method of Van der Helst; but no one can look at his great picture of the Banquet of the Civic Guard without feeling that a method which produced this masterpiece is not to be despised.

So far, portraiture has been very uncompromising. Painters have never flattered their sitters. They have endeavoured to render them just as they are. The great Velasquez never flattered, although as a Court official there must have been some temptation to do so. But when we come to Rubens and Van Dyck we see a distinct endeavour to be polite to their aristocratic sitters. Velasquez never succumbed to the atmosphere of the Court, but they did. Van Dyck, perhaps more than Rubens, being the weaker man. From their time onwards portraiture has never been quite free from the vice of over-politeness except in quite modern days, when we run very distinctly to the other extreme. I sometimes wonder why people go on having their portraits painted, as most modern artists are so singularly unkind to their sitters.

(To be concluded.)

BUILDING PROGRESS IN THE PROVINCES AND SUBURBS.

1661 as loose and granular, and with some exceptions I think this can be taken as fairly descriptive of the methods of his middle and latest periods.

It is in this third or latest period that Rembrandt's full mastery over the resources of oil paint is achieved. I am convinced that he then painted on a dark ground; the paint was put on thickly and so manipulated with stiff brushes as to give any variety of texture he required. He would sometimes dig right through the paint to the ground below. In this manipulation of the actual texture of the paint Rembrandt is supreme—no one has ever done it so well before or since.

The portrait of an old man in our National Gallery, painted in 1659, is a fine example of this vigorous and masterly brush work.

There is another Dutch painter, Franz Hals, whose brush work has been extolled almost as much as Rembrandt's. It is certainly supremely dexterous, but it is not so really masterly. Rembrandt, by the texture of his paint, actually renders the wrinkled skin of old age. Hals does not attempt to do this. He merely excites our wonder by showing with how few touches he can produce the illusion of a finished painting. The method of Hals appears at first sight to be extraordinarily simple. He seems to be more a draughtsman than a painter. The shadows are put in with clear, decided touches, and modelling is less thought of apparently than the accurate placing of the accents which mark the features. The hair is painted with great coarse strokes, like an enlarged drawing. Then the colour of the heads is mostly poor, hardly more than one even tone with brown or black shadows. He seems to have kept all his fine colouring, and it was sometimes very fine, for his costumes and accessories. At least, this is how I used to think of Hals' work, but of late I have begun to appreciate it better, and to find all sorts of very delicate subtleties of modelling, and even of colour, where before I had only been struck by a certain coarseness of effect. And I have lately come across a contemporary account of his work which shows that the method was not quite as simple and as straightforward as it seems.

According to Houbraken, Van Dyck said of Hals: "He had never known anyone who had such power over his brush that after laying on the portrait he could render the important touches in the lights and shades and in the right place with one stroke of the brush without blending or changing; the first stage in his portraits had the effect of an indeterminate blur, then followed the broad brush strokes as if the master said, 'Now the painter's handwriting must come in.'"

This sheds a flood of light on the technique of Hals. I certainly never suspected that the first stage of his portraits resulted in an indeterminate blur, but I can understand how valuable this preparation for the final decided touches would be. No doubt it was this that gave the subtlety, whilst the firm touches gave the dash and vigour.

This is how I conceive Hals to have painted. He used a smoothish canvas with a light yellow-brown priming. One can see this priming in the head of a man at the National Gallery. It forms the ground colour of the hair. He, no doubt, drew in his picture carefully but very broadly. Then came the indeterminate blur which gave the subtle modelling with the merest indication of the features. This was left to dry. Then at the final sitting a very thin coat of the flesh colour was passed over the whole face, broadening and simplifying but not obliterating the modelling given by the blur. Then on the wet paint came the decided touches—"the handwriting"—which gave with the fewest possible strokes the drawing of the features and the matchless vivacity of the expression.

I have dwelt so much on the method of Hals as it is the foundation of what is best in modern portraiture. Mr. Sargent's work is curiously reminiscent of Hals. He has the same admirable vivacity of pose and of expression; the same resolute determination that the finished picture shall have all the freshness of a sketch; the same apparent economy of means, the perfection of the few touches that give all the illusion of elaborate finish when seen at the proper distance.

Of course, in one branch of his art, Mr. Sargent has far excelled his master—Hals seldom painted women; when he did they had no charm. Mr. Sargent has painted many beautiful women very beautifully. Nearly all that is most vital in modern portraiture is derived from Mr. Sargent, and through him from Franz Hals.

In some ways I regret that it should be so. It is a fine method, though not, I think, the very finest. At any rate, it is a pity that so many other fine methods should be unrepresented in modern art. For instance, I have been longing for some time for a movement of "back to Holbein." I can imagine no more wholesome corrective of the modern tendency to sloppiness and haste, but I regret to say that I can see no sign of it.

Rembrandt is too elusive to be followed with any profit, but the methods of Velasquez are so simple that I think they might be imitated with some hope of success.

Then there is another Dutch painter who produced masterpieces by sheer force of competent industry. There was no secret about the method of Van der Helst. It just consisted in painting everything as well as he possibly could in an absolutely straightforward manner. Surely some of us could do the same, if we would but take the trouble! We should have to take a great deal, for there are no short cuts in the laborious method of Van der Helst; but no one can look at his great picture of the Banquet of the Civic Guard without feeling that a method which produced this masterpiece is not to be despised.

So far, portraiture has been very uncompromising. Painters have never flattered their sitters. They have endeavoured to render them just as they are. The great Velasquez never flattered, although as a Court official there must have been some temptation to do so. But when we come to Rubens and Van Dyck we see a distinct endeavour to be polite to their aristocratic sitters. Velasquez never succumbed to the atmosphere of the Court, but they did. Van Dyck, perhaps more than Rubens, being the weaker man. From their time onwards portraiture has never been quite free from the vice of over-politeness except in quite modern days, when we run very distinctly to the other extreme. I sometimes wonder why people go on having their portraits painted, as most modern artists are so singularly unkind to their sitters.

apertures of the casing being directed downwardly towards the fire they are formed so as to direct the emerging air at an upwardly inclined angle approximately parallel with the overhanging back of the fireplace, and in conjunction with the casing the fireplace is fitted with a transverse slab of firebrick set in the sides of the fireplace at a short distance from and parellel with the casing, and having its inner face rearwardly inclined away from the front vertical face of the casing so as to provide between itself and the said casing a constricted passage or throat whose upper and narrowest portion is adjacent to the overhanging back of the fireplace and opposite the exit apertures of the casing. Figs. 1, 2, and 3 are respectively a sectional side elevation, a part sectional front elevation, and a sectional plan of a domestic open fireplace. Within the fireplace 1 and behind

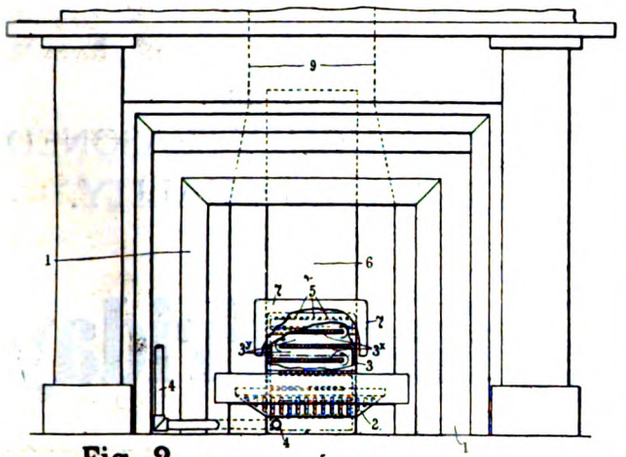

Fig. 2

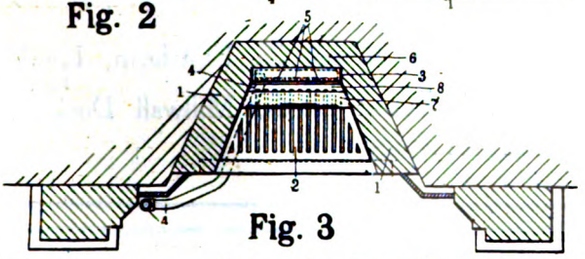

Fig. 3

the grate 2 is a vertical casing 3, preferably subdivided internally by incomplete horizontal partitions 3x so as to provide a continuous air passage 3y leading from the base of the casing 3 to the upper end, to which passage 3y air is supplied by way of a pipe 4 whose opposite open end (not shown) is situated at a distance from the casing 3, so as to ensure a continuous flow of cool air into the lower part of the casing. At the upper front end of the casing 3 is formed a series of exit apertures 5 arranged at an upwardly inclined angle so as to cause the air emerging from the casing 3 to take the form of upwardly directed jets following a path approximately parallel with the overhanging back 6 of the fireplace 1, while in conjunction with the casing 3 the fireplace 1 is fitted with a transverse slab 7 of firebrick or the like set in the sides of the fireplace 1 at a short distance from and parallel with the casing 3, and having its inner face rearwardly inclined away from the front vertical face of the casing 3 so as to provide between itself and the casing 3 a constricted passage or throat 8, whose upper and narrowest portion is adjacent to the overhanging back 6 of the fireplace 1 and immediately opposite the exit apertures 5 of the casing 3. The supply of cool air conducted by way of the pipe 4 enters the casing 3 at its base and, becoming heated, passes upward until it finally emerges from the apertures 5, and the jets of heated air pass upward through the narrow space, whereby a current of flame and heated gases is drawn from the back part of the fire through the throat and produces, as in a furnace, a layer of flame of considerable intensity up the overhanging back of the fireplace 1.—Dec. 23, 1914.

PATENT SPECIFICATIONS PUBLISHED JANUARY 28, 1915.

Selected by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

No. 15,879. July 9, 1913.—Dr. P. R. Wilde, 23 The Circus, Bath. Heating by electricity.

22,423. Oct. 4, 1913.—E. R. Sutcliffe, Leigh, Lancs. Tiles, roof sheets, and the like.

16,243. July 15, 1913.—W. A. Oakley, 19 Penkivil Street, Bondi, near Sydney, N.S.W. Hydraulic cementing material or cement or plaster and manufacture of same.

22,525. Oct. 6, 1913.—A. B. Reck, The Reck Heating Company, Ltd., Esromgade, Copenhagen. Method of operating hot-water apparatus.

24,507. April 28, 1914.—Robert Fletcher, 25 St. Patrick's Road South, St. Annes-on-Sea, and Frederick Stork, Shepherds Yard, St. Annes-on-Sea. Method of and means for applying polish to and for polishing floors, wooden surfaces, and such like.

27,111. Nov. 25, 1913.—Wilkinson, Heywood & Clark, Ltd., F. G. Kidd, and William McLaughlin, Storer's Wharf, Poplar, E. Fluid-tight joints for shafts and the like of agitators of paint and like dipping tanks.

29,964. Dec. 30, 1913.—Dated under International Convention Jan. 2, 1913. A. V. Clorius and O. T. Clorius, 17 Niels Ebbesenvej, Robenhavn, Denmark. Automatic heat-regulating apparatus for steam, hot-water plant, or the like.

30,012. Dec. 31, 1913.—R. G. Marks, 54 Zetland Street, Southport, and Francis Helm, Ltd., Victoria Foundry, Padiham, Lancs. Stoves for cooking, baking, and other like purposes.

Any of the above specifications may be obtained from J. D. Roots & Co.

ULSTER SOCIETY OF ARCHITECTS.

THE annual general meeting of the Ulster Society of Architects was held last week, Mr. N. Fitzsimons, President, presiding over a large attendance of members.

The Hon. Secretary presented the annual report, which stated: The year which has just passed has probably been the most momentous year in the world's history—a year in which practically all nations have been plunged in the horrors of war. The fine arts, which flourish in times of peace, have suffered a serious set-back owing to the great conflagration; and the latter half of 1914 was, as was to be expected, a very quiet time in the profession. Your Council has been throughout the year in correspondence with the R.I.B.A. regarding the recently-formed school of architecture at the Belfast Technical Institute, with a view to having the school approved by the Board of Architectural Education for the preparation of students for the Institute examinations. The Board deputed Mr. Paul Waterhouse, M.A., to visit and report on the school and its work. Mr. Waterhouse visited Belfast on November 26, and, together with the members of your Council, made an official inspection of the school. Following on his report, your Council are very pleased to inform you that the school has now been recognised by the Board of Architectural Education as one of its approved schools. Since the declaration of war the architects in Ulster have responded nobly to the call of their King and country. Already twelve of the profession have joined the Colours, and are now either at the Front or in training at the different camps.

The following officers and Council were elected for the ensuing year: President, Mr. N. Fitzsimons, F.R.I.B.A.; Vice-President, Mr. R. E. Buchanan; Hon. Treasurer, Mr. H. Seaver, B.E.; Hon. Secretary, Mr. T. W. Henry, M.S.A. Members of Council—Messrs. R. M. Young, F.R.I.B.A., W. J. Gilliland, F.R.I.B.A., T. Houston, J. J. M'Donnell, J.P., and G. Sands. Assoc. Members of Council—Messrs. R. M. Close and H. Lamont. Hon. Auditors—Messrs. F. H. Tulloch and J. A. Hanna.

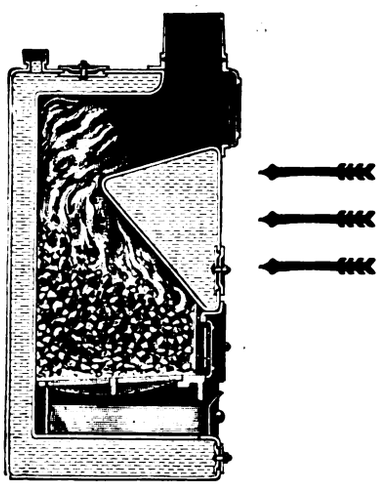
Correspondence

[The Editor will not be responsible for the opinions expressed by Correspondents.]

Some Work of Thomas H. Mawson.

SIR,—I have just seen your article on Mr. Mawson's work at Exeter and at Ottawa, in THE ARCHITECT for January 8, 1915, and feel that, as his first pupil and life-long friend, I must really take up the matter on his behalf.

I realise, of course, that a reviewer must be left to give his untrammelled opinion on the book he reviews within the bounds of legitimate criticism, and had your contributor confined himself to this I should have had no complaint to make.



To begin with, the opening portion, his article, implies

that Mr. Mawson has left his proper sphere as a garden designer to dabble in town planning. Now, as a matter of fact, Mr. Mawson has been a town planner throughout his professional career. The fact that he calls himself a landscape architect shows that he intends this to be understood, and that he includes within the scope of his practice both civic art and landscape gardening. I well remember that, when first I came to work for him, over twenty-one years ago, his scheme for the creation of a new town in Shropshire for Lord Forrester had just been completed, and about that time won first premium in open competition for the work. From that time to this there has almost always been some sort of a town-planning problem on the boards.

With regard to the Exeter scheme, your contributor assumes that Mr. Mawson has proposed the wholesale destruction of valuable property in a quite impossible manner. As a matter of fact, the property was bought by the Corporation and its destruction was agreed upon, partly under a slum clearance scheme, before ever Mr. Mawson was consulted, and I think that your contributor ought not to have been silent on the fact that Mr. Mawson so felt the proposal to sweep away the old church of St. Pancras that, on his own initiative, he submitted an alternative scheme for its retention.

With regard to Mr. Mawson's Ottawa scheme, I feel that your contributor, before tackling a subject like this, should know more of Canadian conditions than he obviously does. He should remember that, in the first place, a title which would be flamboyant for an estate in this country may not be so for one in Canada, where the prairie of to-day is the busy city of to-morrow, and where, for instance, a place of eighty thousand inhabitants can grow up in less than twenty years. I wonder whether, when he gives such prominence to the inuflence of the car route, he knows anything of the electric railway system of that very-go-ahead town, and its unique features which make it quite different to either an electric railway or a tram route in this country. In speaking of the "penchant of the garden architect for sinuous curves" your contributor again shows his entire lack of any knowledge of the conditions prevailing which would not have allowed of any sort of a formal lay-out on account of the contours of the ground, and as to the provision for bakehouses, garages, stables, smithies, &c., I would point out that he shows an utter ignorance of the necessary conditions of urban existence if he thinks it is left to the town planner to say whether he shall include these or not in his suburb. They must be there, and the best thing he can do is to put them out of sight and sound; and if your contributor can see some better way of doing this than by putting them behind screens of trees right away from the roadway, and at the same time keeping them easily accessible, I am sure no one would be more delighted than Mr. Mawson himself to have the benefit of his genius in dealing with an exceedingly difficult problem.

As to your contributor's closing effort to prevent the firm for which I work ever getting any more town planning to do, may I suggest that in cases where we are asked to report upon the cost of a scheme we are always pleased to do so? But in the two cases under review we were specifically told that this was not required, and that only in the latter case were were asked to keep the amount of road-making within reasonable bounds. In fact, it must be obvious that if the estate is to be developed this is the only means by which one can eventually economise.—Yours truly,

JAMES CROSSLAND
(Licentiate R.I.B.A., A.R.San.I., Gold Medallist Nat. H. and T.P. Council).

High Street House, Lancaster, January 28, 1915.

Names and Nationality.

SIR,—I have been annoyed by anonymous post cards which have been sent to some of my clients, and I should esteem it a very great favour if you would publish the enclosed, which was sent to an architect friend of mine (under whose supervision I have carried out several large contracts), together with the letter I received from him in relation thereto.—Thanking you in anticipation, I am, yours faithfully, ROB. SCHAUB.

14 John Street, Bedford Row, London, W.C., January 18, 1915.

[Copy of post card sent from London, W.C., December 8, 1914, to Marshall Harvey, Esq., 36 Station Street, Sittingbourne.]

SIR,—It is to be hoped you will discontinue having any dealings with Schaub, an alien enemy and a filthy German to boot, who said he hoped his countrymen would invade England and treat us as they had treated the poor Belgians. Schaub is a hater of the English, as all Germans are.

A PATRIOTIC ENGLISHMAN.

[COPY OF LETTER.]

36 Station Street, Sittingbourne,
December 23, 1914.

DEAR MR. SCHAUB.—I am sorry to find you have an enemy who is trying to do you harm by sending lying anonymous post cards (one received by me I herewith enclose you), as some people might take it for granted that it was true, without troubling to find out.

For some years I have understood that you were a Swiss, but since receiving the anonymous post card have satisfied myself, beyond any *doubt*, that you are not a German.

I hope you will not take my inquiries as any slur on your character. I looked upon the post card merely as some dirty trick from an enemy of yours, but to be able to contradict it, I thought it advisable to get reliable proof.

I shall inform Mr. Faunce de Laune of the inquiries I made and the replies I got, so that there shall be no doubt in his mind if he has received a similar post card.

I do hope you will be able to find out who sent it and make them smart, which they justly deserve. I cannot but think that the sender is someone either in your employ, or who has been, or who has had something to do with the Sharsted job, or other works you have done for me, for them to know my address. Probably someone with whom you have had some difference.

You may be able to form an opinion of who it is and set a trap to catch them. *Do try!*

Wishing you a happy Christmas and a prosperous 1915, faithfully yours,

(Signed) MARSHALL HARVEY.

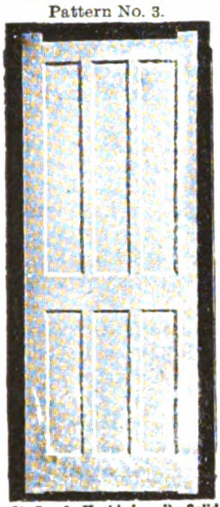
Fuel Supplies in War Time.

SIR,—The following two paragraphs from the current Press deserve to be noted by all interested in the use of fuel, whether in the domestic grate, the steam boiler, or the factory furnace:—

"Threatened Coal Famine in the Midlands.—Birmingham and the Midlands generally are threatened with a coal famine. Not only are householders menaced, but manufacturers cannot obtain regular supplies, and if the present scarcity continues some of them will have to close down. . . . A variety of causes have contributed to this, the most important of which probably is the deficiency of miners, owing to enlistment."

"Amsterdam, January 28.—An order to economise coal has been issued by the German railway administration at Essen. It has further been officially pointed out to housewives that coke is a much cheaper form of fuel than coal, and gives a better heat."

Here is a point certainly where we may well learn from the enemy. It cannot be too widely known—not only by housewives, but by factory managers and other large users of fuel—that there are in many districts full stocks of coke; that it is, at the same price per ton as coal, a much cheaper form of fuel, as a much larger percentage of its weight is readily combustible material; that in kitchen ranges "broken" coke is particularly useful; and that recent experiments have demonstrated that coke can be advantageously employed for steam raising with but slight variations in the furnace arrangements.



It is therefore to the advantage both of the community and of the individual at the same time that the fullest possible use should be made of our coke supplies.—Yours faithfully, A STUDENT OF FUEL ECONOMICS.

MR. REGINALD BLOMFIELD, R.A., Past-President R.I.B.A., and Mr. Ernest Newton, A.R.A., P.R.I.B.A., have received the honour of election as "Membres Correspondants" of the Société des Architectes diplômés par le Gouvernement Français.

THE Incorporated Church Building Society held its monthly meeting on the 21st inst. Grants of money were made in aid of the following objects—viz., building a new church at Gorse Hill, St. Peter, Stretford, Manchester, £150; and towards reseating and repairing the churches at Limehouse, St. Peter, Middlesex, £20; Northampton, St. Giles, £30; and Zeal Monachorum, St. Peter, Devon, £15. In addition to this the sum of £300 was paid towards the repair of seventeen churches from trust funds held by the Society, and three grants were paid for works completed.

President: Maurice E. Webb, M.A.

ACTIVE SERVICE COMMITTEE.

Mrs. Maurice E. Webb (Chairman and Joint Hon. Sec.).

Mrs. Gervase Bailey (Joint Hon. Sec.).	Stanley Peach.
Mrs. Cecil C. Brewer.	Alan Potter.
Mrs. H. M. Fletcher.	Philip E. Webb.
Cecil C. Brewer.	H. M. Fletcher.
Stanley Hamp (Treasurer).	H. Austen Hall.
	F. R. Yerbury (Secretary).

A Committee has been appointed by the Council of the Architectural Association under the Chairmanship of Mrs. Maurice E. Webb in connection with Architectural Association War Service Bureau, for the purpose of providing necessities and extra comforts for the very considerable number of men connected with the Royal Institute of British Architects, Architectural Association, Society of Architects, and Architects' and Surveyors' Approved Society, and the architectural and surveying professions generally who are serving with the Colours.

The Committee now appeals for assistance in its endeavours to make as comfortable as possible the lot of those who have so splendidly responded to their country's call. Owing to the generous assistance already afforded, a very large number of parcels have been despatched both to men actually at the front and to those in training camps and barracks, and the very kind and appreciative letters which have been received from the men confirms the Committee's opinion that the work it has undertaken is meeting a real need.

The Committee has also undertaken to look after the wives and dependents of the mechanics who have been recruited by the A.A. War Service Bureau.

The Committee especially appeals to the wives and daughters of architects and surveyors, and other ladies connected with the building trades, for gifts both in kind and money in order to enable it to meet the heavy and increasing demand which is being made upon its resources.

As a result of careful inquiry, it has been ascertained that the articles contained in the following list are most needed:—

Flannel Body Belts.	Soap.	Magazines.
Scarves.	Tobacco.	Chocolate.
Sleeping Helmets.	Cigarettes.	Leather Boot Laces.
Flannel Shirts.	Papers (Professional and otherwise).	Peppermints (in tins).
Socks.		Dubbin (clear).
Towels.	Igniters.	

All contributions, which will be gratefully received, should be sent to Mrs. Maurice E. Webb, at the Architectural Association, 18 Tufton Street, Westminster. A list of contributors will be published in the "Architectural Association Journal" from time to time.

THE
Architect and Contract Reporter.
FRIDAY, FEBRUARY 5, 1915.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addresed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than* 2 P.M. *on Thursdays.*

COMPETITIONS OPEN.

NEW CATALOGUES.

As the inventors and original manufacturers of building, partition and fixing blocks for walls, floors, and tile hanging, Messrs. J. Wright & Co., of New Malden, are in an especially strong position when it comes to carrying out large or complicated orders. Thus they have recently supplied on a War Office contract 23,000 yards super. of their 3-inch partition blocks for external use in the erection of married quarters. The number of Government jobs for which they have been specified must be almost legion. Among recent ones are Buckingham Palace, Marlborough House, Tower of London, British Museum, Sandhurst College, G.P.O., and the Aldershot Royal Pavilion. At the other end of the scale, perhaps, are such jobs as the Merthyr housing scheme or that at Drogheda. Messrs. J. Wright & Co. claim to sell the lightest and strongest partitions on the market. They are made with the best English Portland cement, together with a special aggregate (not coke breeze). A convincing demonstration of their fire-resisting qualities occurred during the great conflagration at Arding & Hobbs' premises in Clapham Junction four years ago, when the partition blocks remained practically undamaged. They economise in three all-important directions—time, space, and cost. Messrs. Wright & Co., who have been established over a quarter of a century, inform us they keep a large and well-seasoned stock always in hand at their New Malden yards.

THE "Kalor" coke-fired domestic boiler is described in a four-page leaflet which has reached us from Messrs. R. Jenkins & Co., Rotherham. It is, we are told, designed to stand in a kitchen, and forms an excellent adjunct to the gas cooker, enabling the householder to do without the coal-fired range. The top is arranged so that it may be used for warming. It is calculated that No. 1 size, the smallest, would cost in working about 4*d.* per day, with coke at 20*s.* per ton, giving twenty-six gallons of water per hour at 130 degrees. No. 5 size would give 100 gallons per hour at the same temperature. The boiler is provided with large mudholes and covers for cleaning. Every boiler holds sufficient fuel to enable it to keep alight all night. Another variety of the "Kalor" is fitted with a copper interior for cases when the Bower Barff process is insufficient to give clear water.

VERITYS, LTD., have issued a second edition of their electric-light fixtures catalogue-de-luxe, numbered Volume III. in the new series. It is prefaced by an important "War Notice," in the course of which it is explained that as manufacturers they have been affected but slightly by the war, as, except for the glass, they make their fittings, almost without exception, at Aston. Emphasis is also laid on the fact that the French brackets and electroliers are modelled on examples from Fontainebleau, Versailles, and the Petit Trianon, collected by the firm during the past ninety years, and worked up by specially trained Englishmen. That these are very beautiful goes without saying. But fortunately that quality is not the monopoly of any one period. Some of the present-day designs here illustrated, even though less sumptuous, are no less good to look upon, and are attractive for their practicability no less than for workmanship and design. This All-British firm are, indeed, particularly proud of their success in special design work. Volume III. consists of more than 500 pages, divided into eighteen sections.

THE B.S. Engineering Company, 4 Lloyd's Avenue, E.C., have sent us a leaflet illustrating their "Baseco" domestic hot-water boiler, about which we wrote recently. The accompanying diagram shows the deep projecting pocket formed at the top of the boiler and dipping down to the fire, which constitutes a most important feature of the design, for it affords an extra heating surface without

SECTION.

increasing the diameter. Another noteworthy point about the "Baseco" is that the entire dome top can be taken off whenever it becomes desirable to clean out the interior: this must obviously permit of a very thorough removal of all incrustation. The boiler is sold in several sizes, the favourites being 14-inch, 16-inch, and 20-inch diameter.

MESSRS. THOMAS CRAPPER & Co., LTD., 120 King's Road, Chelsea, S.W., point out in their latest catalogue of sanitary appliances that they are exceptionally advantaged in having their warehouses, showrooms, works, and foundry all in close proximity to each other. They are also enabled to offer the service of skilled workmen for repairs to closets, baths, water fittings, &c. The catalogue includes, besides the customary goods, such things as drain-cleansing apparatus, iron gratings, pumps, gullies, geysers, boilers, &c.

FROM Mr. J. Attwood, Station Works, Stourbridge, we have received a businesslike illustrated price-list of hot-water pipes and fittings, with sockets for caulking. The prices are given of the 2-, 3-, 4-, 5-, and 6-inch sizes in most cases. For round rain-water pipes, elbows, and tees a larger range of sizes is quoted, as also for soil pipes and fittings with caulking sockets. It may not be out of place

Digitized by Google

to mention that Mr. J. Attwood is a maker of heating apparatus, anvils, tools, pumps, and much else. Schemes are prepared and estimates given for supplying and erecting effective and economical heating apparatus in buildings of every description.

CATALOGUE "G," of the sanitary appliances manufactured by Shanks & Co., Ltd., Barrhead, Scotland, is on a scale suited to the importance of the firm. Its seven most important divisions are neatly indicated by projecting tags, which enable the particular section desired to be turned up in a moment. The two first, and the two longest, are those dealing with baths and lavatories respectively. We believe we are correct in noting as a new development the illustration of a mahogany dressing table and chair designed to match the lavatory (likewise on a mahogany inlaid stand), shown on an opposite page. Of course Messrs. Shanks have long been supplying the multitudinous accessories which have gradually accumulated among the list of necessaries for the complete residence, hotel, or institute. They will be found in profusion, priced and illustrated, in this List No. 195.

MESSRS. GEORGE WRIGHT, LTD., Burton Weir, Rotherham, have issued a booklet showing their "Hobgrates," which will serve as a companion to their similarly arranged "Doggrates" booklet. Almost without exception the designs are taken from actual old models. But science has stepped in to put an end to their old wastefulness of heat and fuel by introducing improvements like coal-saving bottom grates, sloping fire-brick backs, &c. Special notice should be taken of the hints for building-in, which are intended to remove all likelihood of unpleasant smoking. The designs here shown have been wisely chosen, and are in impeccable taste.

VARIETIES.

MR. C. DRUMMOND, of Fleetwood, Lancashire, retired builder and contractor, who died on October 1, has left £30,143, of which net personalty was £17,244.

MR. CHARLES WALL, J.P., aged seventy-three, of Farley, Grays, Essex, of Messrs. Charles Wall, Ltd., builders and contractors, of 4 Lloyd's Avenue, E.C., left estate valued at £53,791 gross, with net personalty £20,618.

MESSRS. C. JENNINGS & Co., timber and glass merchants, of 978 Pennywell Road, Bristol, have just received a consignment of 1,200 cases of glass, which they are prepared to supply at particularly low prices.

MR. SAMUEL WAYLAND KERSHAW, F.S.A., aged seventy-eight, of 17 Dorlcote Road, Wandsworth Common, S.W., for forty years curator of Lambeth Palace Library, a writer on archæological subjects, and former R.I.B.A. Librarian, left estate valued at £23,726.

MR. A. W. SINCLAIR, builder and contractor, of Scarborough, has been elected President of the National Federation of the Building Trade Employers of Great Britain and Ireland. Over 6,000 firms in England and Wales are members.

THE Guardians of the Spalding Union invite designs, with an estimate of the cost, not later than February 27, for a children's home to be erected in Spalding. Public institution appearance, as far as possible, to be avoided. A memorandum can be inspected at the office of Mr. H. S. Maples, clerk, Spalding, at any time by appointment.

AT the forthcoming meeting of the Royal Sanitary Institute on Tuesday, the 9th inst., a discussion will take place on "Tall *versus* Short Men for the Army." It will be opened by Dr. M. S. Pemprey, M.A., M.D., lecturer on physiology at Guy's Hospital, and late member of the Advisory Committee of the Army Medical Service.

MR. J. J. JOASS, F.R.I.B.A., gave a lecture on the 27th ult. before the Glasgow Institute of Architects, entitled "The Work of the late John Belcher, R.A." A report of this paper when delivered at the Royal Institute of British Architects appeared in our issue of December 18.

COUNT G. N. PLUNKETT, H.A.R.I.B.A., has been re-elected President of the Royal Society of Antiquaries of Ireland; Mr. J. Franklin Fuller, F.R.I.B.A., has been elected a Fellow of the Society; and Mr. P. J. Lynch, F.R.I.A.I., is added to the Council.

THE Civic Museum Sub-committee of the Newcastle-on-Tyne Corporation held their first meeting last week. A scheme is to be prepared at once as to the proposed establishment of a civic museum, the exhibits to include things relating to the history and development of the city; also to social, educational, and industrial growth.

MESSRS. BAKER & FINNEMORE, the old-established pen manufacturers, of Newhall Street, Birmingham, have sent us one of their sample cards of pens made by them. It contains thirty-six sample pens, all of high-class finish. For some time past we have used these pens in these offices, and can testify to the fact that we know of no better pen upon the market. Ask your stationer, when ordering, for the Bak-Fin series of pens.

THE Executive Committee of the Welsh War Hospital at Netley last week decided to double the existing accommodation of 100 beds. There is sufficient money in hand to do this, and also to maintain the 200 beds until the end of the year without making a public appeal. The additional buildings, designed by Messrs. Edwin Hall and E. Stanley Hall, hon. architects of the hospital, will be begun at once.

THE Building Trades Exhibition, fixed to be held at Olympia this spring, will be postponed till 1916. It is not that the trade is unduly depressed, but several firms are now engaged with Government contracts, and many architects, builders and surveyors, and members of their staffs, are absent with his Majesty's forces. There would also be a difficulty in renting Olympia this spring.

THE Edinburgh, Leith and District Building Trades Association held its forty-third annual meeting at 112 George Street, Edinburgh, recently. The Executive Committee hope to issue the conditions of contract and the mode for joiner work by March 1, and the mason mode will shortly follow. Office-bearers for the ensuing year were elected as follows: President, Mr. Edward Bruce; Vice-Presidents, Messrs. James Crowe, David A. Angus, and John Kennedy. An Executive Committee of seventeen members was also elected.

THE Doncaster Corporation have been informed that the expenditure to be incurred in the event of sanction being given this session to the Corporation Bill will be £196,600, exclusive of the cost of passing the Bill through Parliament. The expenditure will be incurred as follows: On street widenings, £50,000; on the construction of a service reservoir at Warmsworth, £16,000; on the erection of municipal buildings, £30,000; on new gasworks, £65,000; and for the erection and equipment of an isolation hospital, £35,600.

FOLLOWING upon a recent deputation from the Woolwich Borough Council to the Local Government Board, drawing attention to the dearth of housing accommodation at Woolwich, owing to the influx of workmen at the Arsenal, the Government have purchased ninety acres of land between Woolwich and Eltham, and the estate is to be laid out as a garden city for Government workmen. The plans provide for blocks of four and six houses, which will be erected in sites 100 ft. deep, leaving ample garden space. About 1,000 houses are to be built, and a portion of the site is to be preserved as an open space. The first 170 houses are to be completed within six months.

THE Newcastle Corporation Trade and Commerce Committee recommended the Council, at their meeting on the 3rd, to construct a new berth on the quayside east of the Ouseburn by extending the quay 330 ft., erecting siding, &c., at a cost of £51,100. The amount is made up as follows: Quay wall, 330 ft. in length, and giving an ultimate depth of water of 25 ft. at L.W.O.S.T., levelling site, and dredging, £27,500; railway and sidings, £3,600; paving, £3,900; shed, £8,400; drainage, lighting, and diversion of mains, £1,350; crane, £1,700; contingencies at 10 per cent., say, £4,650.

THE Executive Committee of Liverpool Cathedral, at their last meeting, received the report of the treasurers on the accounts for 1914. It was explained that after taking into account the recent rises in wages and cost of materials, further contributions to the extent of £44,466 would be necessary to complete the portion of the cathedral now in course of construction. At the rate of progress in force before the war the chancel and first transept would have been ready for consecration in two and a half years from now. Though the withdrawal from the works of men of serviceable age means some delay, the Committee still hope that this event may be so little postponed that it will be recognised as one of the methods in which the diocese may celebrate the conclusion of a glorious peace. A hope was expressed that both the inhabitants of the diocese of Liverpool and visitors would not fail to examine the noble exterior of the building from Hope Street and Upper Parliament Street, whence the view is particularly impressive.

COMPETITION DESIGNS FOR NEW BOARD OF TRADE OFFICES.

In its result the competition for the new Board of Trade Offices reminds us of that of the London County Council building. Once again we see the victory of economical planning over clever attempts at Architecture with a capital A. As is usually the case the most simple and obvious-looking plan, when achieved, is the winner. In conformity with the invariable English custom, the site for the building is far too exiguous to permit of any display of fine planning such as we see in the academic designs of architectural students in the Ecole des Beaux-Arts, or even as is possible in actual buildings on the Continent of Europe or that of America. By rigid economy of space and clever, or at least infinitely painstaking, planning, the site provided has been proved to be sufficient, but no more than sufficient, for the accommodation required to be provided. At least we must assume that the said accommodation has been required, though in default of a copy of the revised conditions issued for the second and final stage of the competition we have to make the deduction from the fact that the plan of the winner has been accepted.

As in all buildings which consist of a multiplicity of offices, the architect engaged on their design has for his first problem to decide whether he will put rooms on both sides or on one side only of his corridors. When, as in this case, the site is restricted in area, direct-lighted corridors entail many lighting courts, and thus in some of the designs adopting this method, those courts are but twenty feet wide and a hundred and twenty deep, regular shafts the light obtained from which on the lower floors is poor in the extreme.

In the winning design Mr. E. Vincent Harris has adopted throughout, it will be seen from the plans that we publish, the system of central corridor with rooms on both sides. The staircases are sufficiently numerous in number, but in no way marked by extravagance for the sake of internal architectural effect. By this economy and the universal adoption of a room-depth of 22 feet, the author has been able to squeeze in all the accommodation in the surround of one great internal courtyard, for the ceremonial passage on the ground floor may be taken as purely adopted for the sake of access to the "historic rooms" of the existing buildings and so quite extraneous to the general plan. It will be noted that as many of the rooms were specified to be of quite small areas, 150 feet super in some cases, the universal depth of 22 feet results in a width of 8 feet only, a proportion which, if not exactly beautiful, may be regarded as a practical one for a single individual's work-room. The treatment of the re-entering angles of the plan is decidedly clever.

Our illustrations of the principal elevations and the perspective show that Mr. Vincent Harris's design bears the same marks of business-like simplicity that characterise his plan. There is no straining after effect by the introduction of features. We have presented to us a clerical factory or workshop, not a magnificent piece of architecture. By its bulk the new office building of the Board of Trade will be impressive, by its simplicity it will be dignified.

In dealing with the external treatment of a huge workshop with many small rooms and some large ones, with a basement and ten other floors above, competing architects had a knotty problem to solve in avoiding a barrack-like effect on the one hand, or on the other of making their office building appear like a big hotel. Some of the designs submitted give two floors above the ground line to a qua-basement, reducing the number of floors between this and the main entablature to three and putting a fourth into the frieze, a fifth into an attic, and the two remaining floors into the roof. Others of the designs show variations, more or less divergent, on this division of storeys. It will be noticed from our illustrations that Mr. Harris boldly includes six floors between his qua-basement and main cornice, whereby he obtains a great accession of dignity. The wearisome monotony that might have resulted is obviated by the device of grouping two upper storeys together by means of an order of pilasters and balcony. Thus there is produced a well-proportioned and finely balanced composition of the façades.

The authorship of the remaining nine designs is concealed, and although it is not difficult to penetrate the disguise, the desired respect for anonymity shall be duly regarded by us, and we will refer to the unsuccessful competitors by numbers only.

No. 177 follows the outline of the site fully, and so has a rather irregular and unsymmetrical plan. As side-lighted corridors are adopted, there are numerous internal courts of small width, and the main internal area is cut into four by a central block in Greek cross form and by projections off the main corridors. The author has also planned some very fine internal effects, with grand entrance halls and staircases. He has, in fact, attempted with much ingenuity to obtain qualities of plan for which the area of the site does not satisfactorily suffice. The external treatment is also of excellent quality, with a modern French type of detail.

Digitized by Google

No. 113 modifies the site into a trapezium form, with parallel east and west sides. A compromise is made in the matter of corridor lighting: those on the east and west have side-light, those in the north and south blocks have rooms on both sides. These necessitate internal lighting areas and a central block. The exterior is treated with severity, two rusticated lower storeys and rusticated end pavilions. The deep frieze with windows is adopted in this design. The detail is modern Neo-Grec.

No. 64 has a good central court, but also for the sake of side light to corridors has included lighting areas 20 feet wide and 120 feet high. The exterior is one of those with the grouping of two rusticated lower floors, one in the frieze, one in an attic, and two in the roof. The end pavilions of the façade are marred in their effect by unhappy proportions.

No. 93 presents a distracting-looking plan from a multiplicity of axial lines, which, though more disturbing on paper than they would be in actuality, result in a number of rooms of irregular shape. The internal area is divided into two "main" courts and two other courts which are not main, and all the corridors are side-lighted but one. Effect in the façades is sought by the use of end pavilions of rather disjointed composition, in which semi-circular arches on Ionic columns are framed by rusticated piers. The detail is of the rare type—in this competition—of twentieth-century English Renaissance.

No. 172 shows a plan which is the result of an idea. The site is of somewhat irregular form, as is common in English public buildings, and the author of this design has regulated it by radiating his whole building from a distant point in the south. The east and west blocks are on radii from this centre, the north and south are segments of circles struck therefrom. Corridors of both manners of lighting are used, and the plan, naturally, is symmetrical and is well disposed around the large central courtyard. The façades lack repose and centrality; their features appear to have no relationship either to the plan or to each other in their grouping. A fine monumental effect is, however, produced by the setting back in stages of three storeys above the main cornice.

No. 94, although adopting the corridor with rooms on both sides, has found it necessary to introduce a central block, dividing the internal area into two courts. The elevations are expressive of steel-frame construction and attain distinction by the use of pilasters, or piers rather, running through three storeys. The external design, both in composition and detail, may indeed be summarised as in Kingsway fashion.

No. 154 also has a plan with two courts and a central block, but is able to indulge in some side-lighted corridors. The exterior is in the fashionable Anglo-French type of Neo-Grec, but the façades are spoilt by the unnecessary additions of dressings to alternate windows in the triple tiers of storeys between basement and entablature.

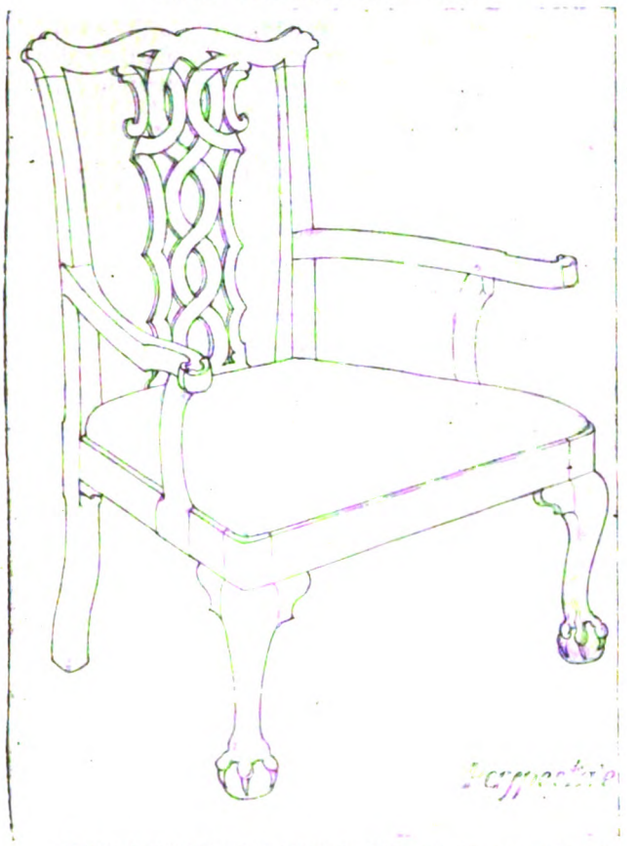
No. 10 again shows a similar plan in main essentials to the preceding two, but here the longer corridors, those on the east and west, rejoice in side light. The exterior is rather hotel-like in feeling, with a central façade-feature of a colonnaded loggia running through the first, second, and third floors. The detail is of the modern Italianised Greek type.

No. 7 has achieved a single internal court except on the ground and lower floors, with a continuation on the first floor of diminished area and section. The re-entering angles are in this case occupied by long-octagon rooms instead of the usual staircase device of getting over this trouble of the central corridor arrangement. The elevation is dignified and refined.

It will be seen that the ten designs selected out of the original 187 are of very varied type, both in plan and external treatment, and although we have in our review emphasised rather the weaknesses that have tended to their want of ultimate success, we may, in conclusion, point out that all have excellences in one direction or another, and the whole collection forms an exhibition of the high standard of present-day British architecture, alike in design and draughtsmanship.

The following is the published award of the three assessors:—

"In accordance with your instructions we have carefully considered the ten sets of designs submitted in the final competition for this building. In our opinion alterations of importance would have to be made before any of the designs submitted, including the one we have selected, could be successfully carried into execution. While fully alive to certain defects in the selected design, we consider that these defects can be remedied without materially altering the scheme, and we are unanimously of opinion that No. 5 is on the whole the best, and we therefore recommend that, subject to the conditions of the competition, the author of No. 5 be appointed architect to the new building."



NOTES AND COMMENTS.

The Royal Society of Painters in Water Colours is to be congratulated on the result of the sale at Christie's in aid of the funds of the Red Cross and St. John's Ambulance Societies, when £2,002 3*s*. was realised from the sale of drawings donated by members. The very successful result was due to keen competition amongst the general public. Offers received while the collection was on view recently in the Society's room gave in most cases a good starting price to the drawings, the majority of which went to private buyers, and at considerably higher bids. In the matter of number of purchasers the sale was probably a record in the rooms. A big figure was early reached when £57 15*s*. was paid by Mr. James Murray for a very beautiful drawing, "Powblack," by Mr. D. Y. Cameron, whose "Borlum" fetched £31 10*s*. Mr. C. Napier Hemy's "Oysterman" was bought by Sir William Garth for £40; one of Mr. Albert Goodwin's contributions brought £31 10*s*.; Mr. Charles Sims's, "On the Shore," £28 7*s*.; one of Mr. Tuke's, "Schooners," £25 14*s*.; and one of Sir E. A. Waterlow's, "Stonehaven," £32 11*s*. Most interest, perhaps, was taken in the two drawings by Mr. John Sargent, which together added £480 to the fund; from £75 "Under the Poplars" was run up to £270, at which the Fine Art Society acquired it, and "Karer See," beginning at £100, went to Mr. Konody for £210.

From the *Scotsman* we learn that the Linlithgow Town Council recently sought the advice of Mr. W. T. Oldrieve, Edinburgh, as to the manner in which they should carry out their proposed scheme of improving the Cross Square, and they have now received Mr. Oldrieve's recommendations on the subject. In his letter, Mr. Oldrieve states that the object of the proposed improvements is to provide a more dignified approach to the Palace, at the same time protecting the fountain and the memorial statue to the late Marquis of Linlithgow from damage. The problem would have been less difficult if the Linlithgow statue had not been in close relationship to the fountain, but presumably the question of its removal to another site cannot now be taken into consideration. If it could, he was of opinion that a still further improvement would be possible from an artistic standpoint. The broad principles upon which he had acted were:—(1) That everything in the way of railings, trees, lamp-posts, &c., around the fountain or statue should be cleared away, as such obstacles irritate and intercept the view. (2) That the largest possible area round the fountain and statue should be enclosed by a low curb and laid out with a broad border, with flowers and quite dwarf shrubs, the centre part being turfed and kept close mown so far as possible. (3) That the approach roadway to the Palace should be made with a slight curve so as to give more interest to the approach, at the same time allowing the enclosed garden to be more central in the Square.

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB

CHIPPENDALE ARM CHAIR, 1760.—In the possession of G. W. BAIN, Esq., Sunderland.

This chair is built of mahogany and is an exceedingly fine piece of work: the lines and forms of the various members being very fine and graceful.

Measured and drawn on the spot by "IMPROVER."

Mr. Barry Parker, in a lecture to the students of town-planning at Birmingham University, gave some useful hints on house-planning, which are of more than local interest. Dealing with typical house-plans of varied size, he showed how, in every type of house, the actual conditions laid down by the site, by considerations of aspect and prospect, and the specific requirements of the future occupants of the house, must be the controlling factors in its planning. The lecturer also drew attention to the way the hall was again coming to assume a more important place in the house plan, but said that modern architects thought it could be made to do this merely by its being increased in size, whereas it could only usefully do this if it were so arranged that the traffic through it from room to room or from room to stairs, or from these to the front door, was rigidly confined to one corner of this apartment, leaving the rest free from traffic and cold currents of air, and therefore comfortable to sit in.

We have before referred to the excavations and explorations on the interesting site of the ruins of Lesnes Abbey, Kent, and the results of those investigations have now been set forth at a meeting of the British Archæological Association in a lecture by Mr. F. C. Elliston Erwood, who said that the work, which had been undertaken by the Woolwich Antiquarian Society, under the supervision of Mr. A. W. Clapham, has now been completed after four years' labour, and at the cost of several hundred pounds. Having traced the history of the Abbey from the time of its foundation by Richard de Luci, in 1179, to its dissolution in 1524-25, in order to provide means for founding Wolsey's College at Ipswich, the lecturer, by means of lantern views, illustrated the course of the excavations, and pointed out how superior in style and strength was the late twelfth-century work of the Abbey to anything that came after it. During the recent work the whole of the infirmary had been cleared, a rather rare thing in the case of an Augustinian priory. The complete plan of the thirteenth-century chapel, built of knapped flint with Reigate stone facings, was disclosed, as also were the walls to a height of two feet above ground level. A very interesting find was the serving hatch from the kitchen into the refectory, the latter now a cowhouse. The hatch led into a little tunnel, nine inches high by eighteen inches wide, along which the food was pushed to the opening from the refectory, and it was a remarkable illustration of the vandalism that prevailed, even in those days, that the floor of the tunnel was a Purbeck marble slab from the top of a thirteenth-century coffin. The finds also included the coffin slabs of Elyas and Fulk, two of the early abbots, and these, with other relics, were now in Erith parish church.

A letter in the following terms has been forwarded by the Postmaster-General to the principal architectural associations:—

"The Postmaster-General wishes to call attention to the importance of making adequate arrangements in the plans of large buildings for the installation at a later stage of telephone equipment. Failure to do so leads to complaints owing to the inevitable interference with the structure and decorations of the buildings and the noise caused by piercing walls and floors. It also delays the installation of the telephone and increases the costliness of the work involved.

"In these circumstances it is to the advantage of all concerned to make adequate provision for telephone, as well as for light, water, and other services, in designing a building, and it has occurred to the Postmaster-General that members of the association may be glad to have some information as regards the accommodation required for this purpose.

"For the telephone service of a large building provision should be made, as a minimum, for one 3-inch pipe from the public footway to the basement or ground floor and for cables to the other floors. It is also desirable that there should be a ready means of leading wires to the various rooms on the different floors. The precise requirements vary according to circumstances, but they can be definitely ascertained in any particular instance from the local Post Office engineer, whose address may be obtained at the nearest telegraph office."

WAR ITEMS.

IN connection with the campaign undertaken by the Board of Trade on the advice of their Advisory Committee on Commercial Intelligence to assist British manufacturers and merchants to secure trade formerly in the hands of German or Austro-Hungarian firms, the Board continue to receive a very large number of inquiries for the names of sellers or buyers of articles of which the sources of supply or market have been interfered with by the war.

Special arrangements have been made in the Commercial Intelligence Branch of the Board of Trade for dealing with these inquiries, and lists are prepared and circulated of articles which inquirers desire (*a*) to purchase, and (*b*) to sell. The eighth list is now ready and may be obtained by United Kingdom manufacturers and traders.

British firms interested in any of the goods mentioned, either as buyers or sellers, should communicate with the Director of the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C.

A PROCLAMATION has been published in the "London Gazette" extending the Copyright Act to literary, dramatic, musical, and artistic works of authors who are citizens of the United States of America, the Government of America having undertaken to grant similar protection of works of British subjects.

FIRE PRECAUTIONS AND THE WAR EMERGENCY.

THE British Fire Prevention Committee's special organisation to meet the war emergency completed its first half-year's work this week. The work comprised mainly an extensive issue of fire warnings; the formation of a technical inquiry office to deal with all manner of technical inquiries; the formation of a special fire survey force of eighty honorary fire surveyors entrusted with special duties; and the formation of a special fire service force of three hundred fire brigade officers and men available for mobilisation at short notice.

No less than 105,500 "fire warnings" in the form of small posters have been issued by the British Fire Prevention Committee and distributed either directly or through the Government Departments and other public authorities concerned. Such "warnings" were specially prepared for military hospitals and refugee hostels (translations in French and Flemish also being made available for Belgian wounded and Belgian refugees). There were "fire warnings" for farmers as to grain storage, for troops billeted, and for factories engaged on Government supplies.

In many cases trade associations were accorded facilities for reproducing the warnings for use among their own members and subscribers, whilst no less than four hundred daily newspapers and technical journals have reproduced the warnings in part or whole.

The Technical Inquiry Office has dealt with many hundreds of cases, some of considerable complication. The Fire Survey Force has dealt with some two hundred surveys, and such surveys have occasionally required the inspection of as many as fifty individual buildings. Several patrols have already been requisitioned from the Fire Service Force.

The whole of the services provided by the British Fire Prevention Committee as far as the professional men assisting are concerned have been rendered gratuitously, the paid staff being limited to a small clerical staff at the headquarters at 8 Waterloo Place, London, S.W.

Over 200,000 postal items have had to be dealt with, and the districts covered include not only Great Britain and Ireland, but the various stations in the Mediterranean and Egyptian Protectorate.

COMPETITION NEWS.

DONCASTER.—At a meeting of the Sewage Disposal Committee previous recommendations as to the proposed sewerage and sewage disposal scheme for the borough were considered. It was moved and seconded that Messrs. Mansergh be asked to amend their scheme to suit the altered circumstances and the views of the Corporation. An amendment was carried, however, by eight votes to two, that a sewerage and sewage disposal scheme be invited by competition, and that prizes be offered as follows, £300, £200, and £100, it being one of the conditions that the prize money of the successful competitor employed to carry out the work shall merge in his commission, which is fixed at 7½ per cent., including the taking out of quantities and all disbursements. It was also decided that an assessor be engaged at a fee of £300. These recommendations were approved by the Council in Committee on January 25.

GLASGOW.—At the last meeting of the District Board of Control a proposal to erect additional buildings to accommodate 300 patients at Gartloch Asylum, with attendants' houses, was discussed, and it was agreed to obtain the plans by competition.

MANCHESTER.—The East Lancashire Masonic Benevolent Association has been informed that in connection with the scheme for the building of a new masonic hall in Bridge Street, twenty-nine architects had sent in provisional plans, from which eight had been selected. A sub-committee of members of the Order who were architects had assisted the assessor, Mr. Walter Higginbottom, F.R.I.B.A., and three plans had been chosen from which a final selection would be made.

PAISLEY.—Mr. John Watson, President of the Glasgow Institute of Architects, who was appointed by the Paisley Burgh School Board as assessor of the competitive plans for the alterations necessary to adapt the Globe Hotel as a meeting place and offices for the Board, recently submitted his report. The architects are Mr. James Carruthers, I.A., Glasgow, who has been appointed to carry out the work; Mr. William Brown, jun., Paisley, who receives a premium of £10; and Mr. Matthew Adam, Glasgow, who receives a premium of £5.

ILLUSTRATIONS.

ACCEPTED DESIGN FOR THE NEW BOARD OF TRADE OFFICES.

A REVIEW of the design of Mr. E. Vincent Harris will be found in a leading article on the competition for the new Board of Trade Offices.

WESTMINSTER HOUSE, MILLBANK.

THIS new building, at the corner of Dean Stanley Street and Millbank, Westminster, S.W., has been erected for the British-American Tobacco Co., Ltd. There is a frontage of about 134 feet to Dean Stanley Street and about 104 feet to Millbank. Messrs. Holland and Hannen & Cubitt, Ltd., were the contractors, and Messrs. Gordon & Gunton the architects. The structure has been erected under the Steel Frame Act, and is entirely supported on steel girders and stanchions, which are encased and protected throughout with concrete, the contractors for the steelwork being Messrs. the Aston Construction Co., Ltd. The building consists of seven floors and the basement, and the height is carried to the extreme limit allowed by the London Building Act—80 feet from pavement level to eaves—with two storeys in the roof above and towers at the three corners. The floors throughout are formed with reinforced concrete and tile construction. Some of the girders supporting these floors are of exceptional span—over 40 feet. This gives a clear floor space without any columns or other obstructions. The retaining wall on both fronts, with the vaults at the back of same, have been executed in reinforced concrete, like the large strong room in the basement. The whole building is heated with atmospheric steam, and there is a system of mechanical ventilation to several of the lower floors. An artesian well has been provided, and the water supply therefrom has been ascertained to produce about 4,000 gallons per hour. This is stored in large tanks, chiefly in the basement, which have a capacity of more than 25,000 gallons. The frontages to Millbank and Dean Stanley Street are faced entirely with Portland stone, with the exception of a plinth at the pavement level, which is in polished Aberdeen granite. The roof is covered with Westmoreland green slates, and the dormers are covered with copper.

The sub-contractors were as follows: Steelwork, Aston Construction Co., Ltd., New North Road, N.; stonework, F. J. Barnes, Portland Stone Quarries, Portland; granite, J. Fyfe & Co., Aberdeen; marble, Farmer & Brindley, Ltd., Westminster Bridge Road, S.E.; electric lifts, Waygood-Otis, Ltd., Falmouth Road, S.E.; drainage work, sanitary plumbing, sanitary fittings, marble work in lavatories and cold-water supply, Davis & Bennett, Horseferry Road, S.W.; electric light, bells, &c., Ellis & Ward, Ltd., Queen Victoria Street, E.C.; artificial stone stairs, Stuarts Granolithic Co., Ltd., Bedford Row, W.C.; slating, A. W. Allard & Co., Clapham Junction, S.W.; lantern lights, British Challenge Glazing Co., Tooley Street, S.E.; area light and pavement lights, British Luxfer Prism Syndicate, Finsbury, E.C.; wood block flooring, Acme Wood Block Flooring Co., Gainsborough Road, N.E.; ironmongery, W. & R. Leggott, Ltd., High Holborn, W.C.; strong room doors, Milner's Safe Co., Ltd., Finsbury Pavement, E.C.; floor lights, J. A. King & Co., Queen Victoria Street, E.C.; asphalte, Claridge's Asphalte Co., Central Buildings, Westminster, S.W.; ornamental ironwork, W. T. Allen & Co., Queen Victoria Street, E.C.; desks, Shannon, Ltd., Ropemaker Street, E.C.; ferro-concrete, Considere Construction Co., Ltd., Victoria Street, S.W.; iron sashes and lead lights, W. James & Co., Willesden, N.W.; door springs, Smith & Turner, Bartholomew Close, E.C.; carving, Gilbert Searle & Sons, George Street, S.E.; heating and ventilation, J. Jeffreys & Co., Westminster, S.W.; artesian well, A. Williams & Co., Old Ford Road, Bow, E.; flagstaffs, J. Piggott & Co., Bishopsgate, E.C.; vacuum cleaner, Sturtevant Engineering Co., 147 Queen Victoria Street, London; lockers and steel fittings, Crittall Manufacturing Co., Braintree, Essex; Chubb's Safe Co., Queen Victoria Street, E.C.; and Estler Bros., South Molton Road, Victoria Docks, E.; wood fittings, Waring & Gillow, Ltd., Oxford Street, W.; blinds, Alfred Shingleton, Kensington, S.W.

THE PRINCIPLES OF GARDEN CITIES AND THEIR APPLICATION TO BELGIUM.*

By MR. EWART G. CULPIN.

ONE of the lessons which have been most insistently impressed upon civilised communities in the last decade is that which is the result of the more intensive civic and sociological study which has taken place of recent years, and is the application to the affairs of everyday life of those principles of science which have resulted in so much advancement in all fields of commerce and invention. The expert has discovered that, without doubt, the great cities are not productive of healthy life, and that universally they are dependent upon the small towns and the countryside for their revivification. An examination into the origin of the men undergoing the greatest fatigue or those trades where physical endurance is most necessary, will show that these are recruited mainly from the countryside.

Fifty years ago when the stress of modern development was not so insistently felt, and before the world had become accustomed to the rush of life which modern commerce necessitates, and while our towns were still comparatively small and the fresh air had comparatively easy access, the question was not such a serious one, because there were ample reserves to draw upon for replenishing the stock of town life. But now from every quarter of the world we hear the same cry, and our country—England—has become a race of town dwellers. Even in the new countries of the world, such as America, where fifty years ago only 3 per cent. of the population lived in towns, the proportion is now about 50 per cent., and is rapidly increasing, so that even there, with the vast resources of open agricultural land, the proportion of agricultural population is steadily decreasing. And in the rapid development of our towns consequent upon industrial expansion there have arisen conditions which have tended more to the destruction of life and to the creation of inconvenience rather than to betterment.

Before the days of adequate sanitary control houses were built and streets were made with no regard to the real needs of the population and without consideration of public convenience, while the question of beauty—the preservation of natural beauty or the securing of architectural beauty in development—was quite unthought of. In course of time this led everywhere to congestion, to overcrowding, to slums, resulting in a population with a distinctly lower standard of health, physique, morale, and mentality. Wherever we look we find that vital statistics prove the slum to be the deadly enemy of health; that even where no actual slum exists overcrowding increases death and sickness rates and predisposes the inhabitants to certain diseases. The criminal statistics show the same thing. Lunacy experts declare that the increase in these crowded quarters is nearly ten times as great as elsewhere, while we all know from our own experience that these conditions produce a lack of self-control and a predisposition for vice and violence. The child born among such conditions is, indeed, predisposed to an evil course of life.

With such a chain of circumstances forced upon our consciousness it became necessary to discover if there was not a remedy. Various men in various countries have suggested one remedy after another. Legislation for control of the use of the land, laws for the building of certain types of property, and ideas of all sorts as to the provision of an ideal city have sprung up regularly. From the time of the ancient prophets there has been a vision of a city of health and happiness, but the vision has not been realised. And none of the model communities founded in different parts of the world, most of them with a religious basis, have proved successful. What was required was a community which, although not naturally created, should be created in accordance with the laws of natural growth, and instead of aiming to provide for a particular type of individual or a perfect type of individual, should provide for an ordinary normal population.

That solution has been found in the Garden City, whose principles were first proclaimed seventeen years ago by Mr. Ebenezer Howard in a book entitled "Garden Cities of To-morrow." Never, perhaps, in the history of the world has a new idea been so quickly received, adapted, and assimilated as has the idea of the Garden City, and although in many of its developments the original idea has been lost sight of, and some communities have been founded under the title of "Garden Cities" which are only a mockery of that name, yet it has been found, wherever the principles have been put into practice, that it has been good not only for the individual but for the community as a whole. And this is the idea which runs throughout the whole principle of Garden Cities and Suburbs, and also Town Planning—that we must seek to work for the good of the community, and that lasting benefit to the individual can only come as the community is benefited. The foundation principle is co-operation. It is only by co-operation that the great experiment of the Garden City has been built up, and that the fifty or so examples of Garden Suburbs in England have come into being; it is only by co-operation that it is possible for town planning to be put into practice, and it will be only by co-operation that the vast question of the reconstruction of Belgium can be carried out in a manner worthy of her history and traditions.

In the old days, when the beautiful cities of Flanders grew into being, men strove together in the arts of peace and vied to produce buildings individually pleasing to the eye and collectively forming a picture of grace and beauty which has ever since attracted the student from all parts of the world; but in these days, and especially the days we are looking forward to when rebuilding begins, it is terrible to think of what would be the effect of each owner of each site erecting his own house according to his own ideas and without relation either to its neighbours or to the street in which it was placed. We in England have many painful examples of what that has produced, but we are beginning now to have examples of what co-operation can secure, and it is to the meaning of this that our attention is now directed.

In the first place, we must understand clearly the meaning of the terms we are employing. The Garden City movement in Great Britain has been initiated and carried on entirely by companies and societies acting as societies of public utility, with a limited dividend on their share capital. The whole movement, both here and elsewhere in the world, has grown out of the Association formed to examine Mr. Howard's proposals and known as "The Garden Cities and Town Planning Association." This in its turn led to the formation of the International Garden Cities and Town Planning Association, linking up the various bodies throughout the world which were founded with similar objects.

It may be well to set out at the beginning the essentials of a Garden City as distinguished from a Garden Suburb, and from ordinary development. These may be stated as follows:—

1. That before a sod is cut or a brick is laid the town must, in its broad outlines, be properly planned with an eye to the convenience of the community as a whole, the preservation of natural beauties, the securing of the utmost degree of healthfulness, the proper regard to communication with the surrounding district.

2. That in the town area the number of houses to each acre should be strictly limited, so that every dwelling should have ample light and air, with a suitable garden, and that public recreation ground and open space should be provided generously.

3. That the town area should for ever be surrounded by a belt of agricultural and park land, so that while in the centre the urban problem is being dealt with, the rural portion, which should be the larger part of the estate, may be available for farms and small holdings, in order that the small holder and market gardener may have a new market direct to hand for the sale of produce.

4. That the return on capital should be limited to, say, 5 per cent., any profit above that amount being applied to the estate itself for the benefit of the community.

That in order to adjust the claims of the shareholders in the promoting company and the residents on the estate, the return on capital should be limited to, say, 5 per cent. The land being let on leasehold tenure, the main source of income would be ground rents, whose increasing value would be secured by the activities of the tenants themselves. In order that the inhabitants may benefit from the increment of value resulting from their labour, all profit over 5 per cent. should be applied to the estate itself for the benefit of the community. The conversion of rural into urban land will result in such increment that, properly started, the progress of the estate is certain until the accruing increment makes it possible for the town itself to assume control of the land.

* An address delivered on Thursday afternoon, February 11, at the Guildhall, before the International Conference on the Rebuilding of Belgium.

Digitized by Google

5. That the town should be not merely residential, but also commercial and industrial, that provision should exist for taking the worker and his work away from the crowded centres into the fresh air of the country district, where not only should the land be cheaply obtainable for the employer, but the worker should have a comfortable cottage at a convenient distance from his labour.

It is therefore essential that the land should be of considerable area, and its development should be in the hands of one controlling body, which, in Mr. Howard's scheme, should have for its ultimate object not the making of huge profits, but the improvement of the conditions of life for all who live on the area. The estate should be somewhere from six to ten square miles in area, and in order to give effect to the desire for the combination of town and country, about two-thirds should be reserved for the rural area.

The question of the manufacturer is perhaps the most important of all in considering the full Garden City scheme, because although land may be cheaply acquired away from the great towns and houses may be cheaply built, unless there is labour for the working-man, population will not be secured of the sort which will build up a natural town containing all sections of society. It was a point which, when the idea was first mooted, was hailed entirely as utopian -much to be desired, but still unachievable. It was admitted that for a great number of businesses it would pay better to have works out in the country, where rents, rates and taxes would be less, where there would be more room for expansion, and where the workmen would be better equipped for their work from constant contact with the open air. We are happy to be able to demonstrate that not only has this been true in theory, but it is abundantly proved by events. The experience of the manufacturers of the Letchworth Garden City entirely proves the statement put forward, and on our visit there we shall have the opportunity of seeing what has been done.

It will be seen, therefore, that a Garden City is a proposal of definite sociological and economic basis. It deals at one and the same time with the problem of the overcrowding of the towns and the depopulation of the country districts, a problem which, although not so pressing in Belgium, is one which the bulk of civilised countries are regarding with alarm.

As a contrast to the few hectares of land which are called "Garden Cities" for the sake of deriving profit from the use of the name, we see that a Garden City is a self-contained town—industrial, agricultural, and residential—planned as a whole and occupying land sufficient to provide garden-surrounded homes for a population of from thirty to fifty thousand people, as well as a large stretch of open fields which would do much in providing the necessities of the population. It meets the difficulties raised in the first part of this paper as to the non-reproductivity of the towns by securing that the town shall have the healthfulness of the countryside, and it keeps the people in the country by bringing the benefits of the town to their doors.

Town life and country life both have two sides. On the one side the town offers its facilities for commerce and industry, for education, for social life; it offers a higher money wage and better opportunities for advancement; there are the clean, well-made roads, the benefits of sanitation, and, indeed, the resources of civilisation; on the other side, there is the congestion, the dirt and the squalor of the poorer parts, the loneliness of crowds, and, perhaps most important of all, the closing out of nature. And while the country secures health and vigour, the advantages of sunlight and fresh air, the freedom of the hills and valleys, the singing of the birds and the sighing of the trees, Nature's open door and open book, there is the lack of the town facilities; wages are low, opportunities are few, education is scant, and housing accommodation is often as bad as it is in the towns; there are few opportunities for self-improvement, and the lack of sanitation and of provision for recreation tend continually to drive the brightest spirits into the towns.

This is a state of things which the proper application of the Garden City method would prevent.

The Garden Suburb is the application of some of the principles of the Garden City to the growth of existing cities. It provides that the land shall be town planned first of all in order to prevent bad conditions springing up and to secure the provision of proper open spaces and proper building laws. They are residential only, and do not attempt to deal with manufacturing or with rural questions. Usually controlled by one body of individuals working for the common good, there is provided a complete scheme of building, so that not only is one house built well, but all the houses are built so as to form a complete street, as in our old-time towns, and every street is built to fit into the complete town, so as to operate for the utmost advantage of each inhabitant.

Throughout all these schemes the leasehold system of tenure is in practice, as by this means only can proper restrictions be enforced as to the development of the estate and the care to be taken in its development. The term of the lease may vary.

One of the most important results of the founding of these communities on a co-operative basis is the growth of the communal spirit and the encouragement of a spirit of fellowship amongst the inhabitants of these garden suburb estates. You will find that in all the important garden suburbs there is a club-house or institute or meeting-room of some kind where the activities of the whole estate are focussed, and which is the common home of the people. And nowadays, when the stress of competition and the bustle of everyday life is driving men farther and farther apart from one another, it is of the utmost value that we conserve these opportunities of drawing men's minds more toward one another, and of fostering a spirit of unity of purpose.

There remains to be dealt with the term "Town Planning," which is distinct from either of the two foregoing propositions, but is part of them as they are part of it. Town planning is the science of prevision in all civic matters, and is the affair of the State and of the Municipality. The subject will be dealt with in other reports, and here it is only necessary to say that town planning is an absolute necessity if we are to secure that a town is to develop rationally on lines which shall be for the health, comfort, and happiness of its inhabitants, securing order and beauty in its growth, providing open space, and preventing overcrowding, adding dignity to civic life and fostering a love of the town in the hearts of its inhabitants.

But here again co-operation is the secret of success. Combined effort for the common good can secure what individual effort, however valuable and however well-directed, can never hope to win. In the great struggle in which our countries are now engaged our strength, our hope of victory, lies in combined effort, in the merging of individual strength and of individual wisdom in common action for the defeat of the foe. So should it be in our national and municipal life. We can only successfully overcome the enemies dirt, disease, inconvenience, ugliness, by common action, by merging our own wishes and our own desires in a great aim for the public good; not seeking that our own little piece of ground may be developed merely in the way that we think best, but that it may be regarded as part of the street, part of the town, and that it must fill its place in the general scheme of the development of a well-ordered community.

I have attempted the difficult task of compressing into a short paper the principles of a movement which is many-sided, each side requiring much more amplification than the whole of this paper. How far the principles here laid down are applicable to Belgium and will be applicable to the new conditions arising in Belgium after the war it is not for us to say; there are questions of law and custom, of land tenure, of finance, which would all have to come under consideration.

While we advocate beginning afresh with a clean slate, we recognise that a great deal of the work will be restoring some of the ancient cities. We do not wish to suggest in any degree that the ancient beauties of your country shall be disregarded, or that your traditions shall be overlooked in the rebuilding that goes on; every care must be taken to preserve what is left from the destroyer's hand. Local customs, local traditions, and local history must all be studied fully, and due regard must be had to each if the rebuilding is to give lasting satisfaction.

It would seem probable that there would be an opening for the establishment of one or more Garden Cities in the full meaning of that term—possibly with different regulations and carried out in a different manner because of local conditions, but still aiming at that object towards which Mr. Ebenezer Howard strove—namely, the founding of the city beautiful upon a sub-structure of health and convenience. Whether or not the full scheme be adopted, there is no doubt whatever of the great opening for the applica-

Digitized by Google

tion of the principles of town planning and of the Garden Suburb. Almost every civilised country has found one phase or another of the Garden City movement has answered to its requirements, and we may be confident that in Belgium also there may be an adaptation of the experience which has been gained in this and other countries.

It is for you architects, engineers, professional men, and citizens of Belgium yourselves to examine these problems and see how they can be applied, and in what measure. What is done must be done by you. We on this side are ready to show you where we have succeeded, and also where we have failed; our experience is placed at your disposal, that the final effort may be your own. Surely it is a noble ambition that out of the present disaster we shall ensure future good; that out of the ashes of her beauteous but war-scarred past a new and still beautiful Belgium shall arise, whose children shall never know the fear of treacherous invasion, and who, housed and equipped with all the resources of modern civilisation, may as bravely play their part in industry, in agriculture, in commerce, as their fathers have played on the battlefield.

OLD BRIDGES.

AN interesting and well-illustrated lecture was given on Wednesday evening, January 27, at Carpenters' Hall, by Mr. Aymer Vallance, M.A., F.S.A., dealing with the above subject. In his opening sentence he pointed out how the building and maintenance of bridges must always have assumed a paramount importance. It was from early times included by law in the *trinoda necessitas*, the threefold obligation from which no one throughout the realm, save under rare and special circumstances, was exempt. An instance of an exemption was the famous Abbey of Beaulieu, which, in a charter from King John dated January 25, 1204-5, was acquitted from paying toll "in all passages of bridges" throughout the kingdom and also from all works of bridges in perpetuity. As a general rule, ecclesiastics and religious communities were equally liable with lay people to the general duty of bridge-building and repair.

What kind of bridges were built in the earliest times would depend mainly on the materials to hand in any given district. Of a very primitive type is the bridge, or rather causeway, at Thirlmere; but the real home of such causeway bridges is the south-west of England, where one finds the famous example Torr Steps, on the Barle, not far from Dulverton. Although no cement is used, the stone slabs which compose it are of such enormous weight that they effectually resist the worst floods. Another ancient example of this trabeate type is Slaughter Bridge, spanning the Cornish river Camel, about a mile north of Camelford. In stone, however, it is comparatively rare to find bridges of post-and-lintel construction, which were impracticable for navigable rivers owing to the narrowness of the openings. The vast majority of bridge masons have accordingly availed themselves of the resources of the arch. So rational and so constructive is arch-building that it is only by extraordinary perverseness that an arched bridge can be made anything else than noble and comely.

A peculiar class of wooden bridge (of which there seems to be no old example in England) is the bridge covered to afford protection from snow-drifts. The quaint form of this type must be familiar to all who have visited Lucerne, where, across the mouth of the Reuss, remain two such, one dating from 1303.

Bridge construction offers many very special problems. But it is also simpler than that of other kinds of arched buildings in so far as the arches, whether semi-circular, segmental or pointed, are always barrel-vaulted without anything of the nature of cross-vaults or groining. The arches were in many cases stiffened underneath with transverse arches, forming huge ribs—an advance in constructive energy and strength corresponding to the economy which learned to dispense with superfluous wall masonry while strengthening it at intervals with buttresses.

The piers of bridges very often project anglewise on either side beyond the face. These projections serve the twofold purpose of buttresses and cutwaters, the latter breaking the impact of the current on the same principle as the pointed stem of a ship. These cutwaters were sometimes hipped and finished off before reaching the parapet level. When, however, they ran all the way up the side to the top (as seems to have been the usual custom in England), the triangular recesses in the parapet fulfilled the additional purpose of providing refuges for the safety of foot-passengers.

On the Continent an organised confraternity of bridge builders is known to have been in existence at least as early as the second half of the twelfth century, though they are not recorded to have spread into England. Under their superintendence was built the famous bridge across the Rhone at Avignon, dating from about 1180. Four arches of it still remain with the Chapel of St. Benezet on the central pier.

In time of war, of course, bridges always had a tactical importance, and that is why many of the larger ones were fortified or, in default, were so placed in relation to an adjacent castle or other defence works that the latter could command the approaches and protect the bridge against attack. Such bridges would, as a rule, form fairly level causeways. On the other hand, bridges without extraneous means of defence would, for greater security, be constructed with a gradient rising from each end to the centre. For it is obvious that a bridge with an incline in the middle must afford better cover for its defenders than a level bridge. Another simple device for affording flank protection was to place a bridge with its axis at an angle to that of the approaches, resulting sometimes in a very awkward turn. Another explanation of this may apply in cases where a ford preceded the erection of the bridge itself, the passage of the ford continuing in constant requisition for transit until the bridge was ready for use, so that the bridge had to be built alongside rather than on the exact site of the ford. Presuming, then, that the ford was in a direct line with the roadway, it follows that the bridge built subsequently could not but be out of line with the roadway.

In mediæval times nothing that rightly occupied and concerned humanity but was also first and foremost the concern of the Church. There was no hard and fast line of distinction drawn between sacred and secular, for religion entered into every phase of a man's existence, sanctifying all, even the most commonplace, of his pursuits and actions, day by day and hour by hour, from his cradle to his grave. It could not happen then but that a duty so indispensable as bridge building was for the temporal well-being of the nation should be approved and fostered by authority of the Christian Church.

Many English mediæval prelates discharged their pontifical office in its most literal sense. Thus, at Hereford, Bishop Richard de Capella, who occupied the see from 1120 to 1127, was a liberal benefactor towards the expenses of erecting a bridge across the Wye. Walter de Langton, Bishop of Lichfield from 1296 to 1321, built bridges across the minster pool in order to provide an easy communication with the city. An abbot of Ramsey built the existing bridge over the Ouse at St. Ives in Huntingdonshire.

Besides setting the example of good works themselves, it was customary in many instances for bishops to provide the faithful with an incentive by indulgencing bridges; that is, they offered remissions to such persons as cared to contribute toward the building or maintenance of bridges in lieu of other penance already imposed. It was eminently characteristic of mediæval Christianity that it knew how to elevate and transform by its hallowing touch the commonplace or irksome obligations of civil life to the rank and dignity of meritorious acts of mercy. "It is a blessed business bridges to make" was inscribed on the bridge at Abingdon.

A bridge being thus, as it were, a focus of piety, it was but natural if that piety found definite expression in the erection of chapels in close conjunction with bridges, the chaplain often having the duty of collecting for the upkeep of the bridge. A large proportion of the more important thus came to have a chapel, either actually upon them or at one end. No bridge chapel in England has continued in a decent state of preservation down to the present day. And this is in all cases to be explained by their former ecclesiastical status. Had they been parochial they might have had a better chance of escaping the rapacity of Henry VIII. or Edward VI. But being one and all of the nature of chantries, they were condemned as such to be despoiled at the Reformation. There yet stand remains of chapels at the end of the bridges of Rochester and Derby. But on the very bridge itself no more than three recognisable chapels survive—viz., at Wakefield and Rotherham in Yorkshire, and at St. Ives in Huntingdonshire.

Throughout the Middle Ages there was no bridge across the Thames below Kingston Bridge except London Bridge,

Digitized by Google

twenty-one miles away. That fact has to be remembered to appreciate the supreme importance of this unique thoroughfare between the Metropolis and the South, the most direct highway to the continent of Europe. As the largest and most splendid in England, London Bridge became the wonder and pride of the whole nation.

The tradition is that the original wooden London Bridge was constructed in 1002, crossing the river somewhat lower down the stream; that is to say, further eastward than the present site. This early bridge, however, perished in a great conflagration in 1135; it was replaced by another bridge, likewise of timber, in 1165.

London's earliest bridge of stone dated from 1176, and is said to have taken thirty-three years in building. A priest named Peter de Colechurch has won immortal fame as its engineer. He died in 1205, having prepared for himself a sepulchre amid the foundations of the great central pier. In the direction of the work he had already, in 1201, been superseded by a Frenchman named Isembert, whom King John dispatched to England, and by letters patent appointed architect of the great bridge of London, then nearing its completion. It was finished about 1209. The enormous piers and widespreading sterlings round them offered so dense a barrier to the passage of the water between them that the tide, all above the bridge, never fell low enough to expose the vast stretches of unsavoury mud which make the riverside the noisome eyesore it becomes for several hours a day at the present time.

The mischief which ended in despoiling London of one of its splendid and historic monuments arose through the meddling of officials contrary to the advice of experts. In 1756 an Act of Parliament authorised the Corporation of London to purchase and take down the houses upon the bridge, and also to remove one pier, in order to form one large central arch in place of two smaller ones. Of these two measures, the first proved most injurious, the second absolutely fatal. The removal of the houses, which were bringing in a rental of over £800 per annum, disendowed the bridge and robbed it of the most fruitful source of means for its upkeep and repair; but bad as this might be, it was as nothing compared with the removal of the pier. The eminent engineer Mylne warned the authorities of the grave risk to the stability of the structure if they should tamper with one of its integral parts. But they insisted, and Mylne had no choice but to carry out their instructions.

The bridge across the Avon at Bristol ranked only second to London Bridge. The first stone bridge at Bristol was built in 1247, and a chapel in the middle of it was consecrated in 1361. A new bridge was opened in 1763, and the event prompted Thomas Chatterton to send to the *Bristol Journal* a fictitious account of the ceremonial of the opening of the mediæval bridge, an account which he pretended to have "taken from an old manuscript."

The third bridge in importance in the kingdom was Rochester Bridge across the Medway. It was built between 1389 and 1392. A new bridge lower down the stream was begun in 1851, the old one being demolished in 1858. The old one lasted 450 years, the new one hardly sixty before it was necessary to remodel it.

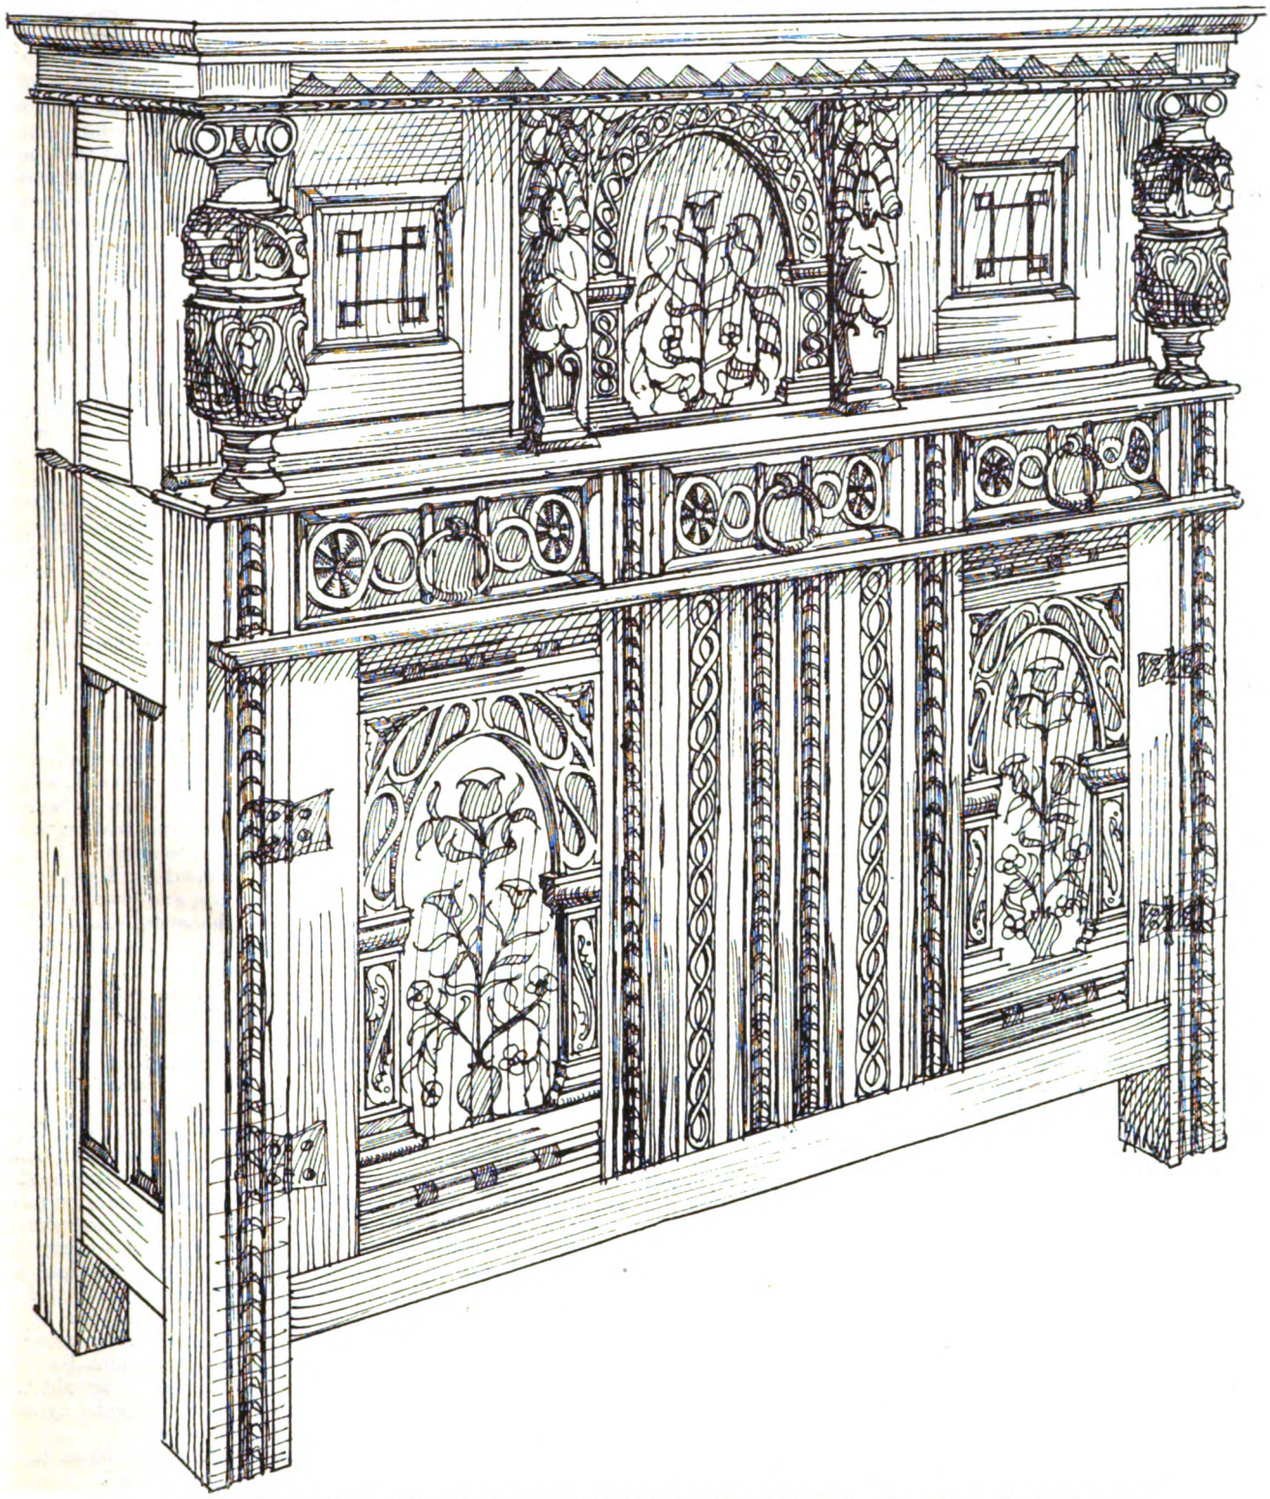
The importance of bridges consists in their very great utility. They were built because they were wanted to serve the needs of man. Bridges thus belong to the high category of works of architecture—at least they should so belong. But in present practice unfortunately they do not, for bridge building has come to be the monopoly of the engineer, who plans and arranges the whole thing, the architect being called in to add the superficial trimmings, which give the bridge a plausible pretence of architectural design. This practice is neither fair to the architectural profession nor to the public at large. The practical result is that instead of new bridges being, as they might be, and as old bridges erected under other conditions invariably were, among the monumental beauties of our country, they are among its worst disfigurements.

Mr. Vallance concluded with an appeal for the preservation of all the old bridges which remain to us. "I urge you," he said, "to remember what they once were and what they meant to our forefathers; to think how they were built in piety and consecrated, some of them by the blood of martyrs who laid down their lives for the sacred cause either of national freedom or of liberty of conscience. And then, remembering what glorious and hallowed associations cling to them, you will be persuaded that it is an outrage only one degree less impious than destroying ancient churches to destroy an ancient bridge."

THE CONCRETE INSTITUTE.

AT the fifty-sixth ordinary general meeting held on Thursday, February 4, a joint draft report of the Science and Reinforced Concrete Practice Standing Committees of this Institute on a standard specification for reinforced concrete work was submitted for discussion prior to its amendment and subsequent issue in final form. Professor Henry Adams, M.Inst.C.E., President of the Concrete Institute, was in the chair. The secretarial note says: "The draft report is copyright and is not for publication."

However, "the Press are permitted to refer to the draft report in general terms."



This we are prepared to do by stating our opinion that, on the whole, the report presents a very fair basis on which the much to be desired standard specification for reinforced concrete work might be framed by a joint committee representative of the various societies and interests concerned. Where the whole essential of effective criticism of a standard specification rests on a detailed examination of every individual clause it is obvious that general terms will fail in adequacy.

The submission of the report was succeeded by a discussion in which the following took part: E. Fiander Etchells, Assoc.M.Inst.C.E., F.Phys.Soc., Member of Council C.I., Chairman of Science Standing Committee; S. Bylander, Past Chairman J.I.E., M.C.I., Chairman of Reinforced Concrete Practice Standing Committee C.I.; Professor Henry Adams, M.Inst.C.E., President C.I.; Richard Coulson, F.S.I., M.C.I.; Gower B. Pimm, Assoc.M.Inst.C.E., M.C.I.; Morgan E. Yeatman, M.A., M.Inst.C.E., Member of Council C.I.; T. C. Dawson, M.C.I.; Henry J. Harding, M.C.I.; L. C. Hall, Assoc.M.Inst.C.E., M.C.I.; Allan Graham, A.R.I.B.A., M.C.I.; W. H. Lascelles, M.C.I.; A. van Osenbruggen, M.C.I.; G. S. Roberts, M.C.I.; A. Scott, A.R.I.B.A., M.C.I.; J. F. Warden, M.C.I.; E. P. Wells, J.P., Past President C.I.

Mr. E. Fiander Etchells, as chairman of one of the two committees concerned in the preparation of the report, opened the meeting with an invitation to the members to discuss the report and so help to frame the laws by which it was proposed they should be governed. The report had been made with a view to standardising as much as possible the methods of different specialists. A few years ago every one of these had his own methods. The committee endeavoured to ascertain what might be considered as the criterion of good work. Many specifications included clauses which were impossible to carry out, as, for instance, one which directed that all steel work should be dipped in "boiling" oil. The draft of the standard specification now offered represented the wreckage of the many clauses placed in front of the committee. Most specifications had been examined and they had endeavoured to make their own a consistent whole embodying the ideas current amongst all engineers of good practice. They could not say there was any particular clause taken from any particular specification which had been submitted, for in such technical matters there was no monopoly of truth. In order that there should not be one set of conditions for architects and another for contractors they had adopted the R.I.B.A. conditions of contract. The proposed Clauses 3, 4, and 13 followed general lines. There was some variety of opinion with regard to the details of storage; but the committee believed they had ascertained the consensus of authoritative opinion. They laid stress on the importance of keeping the cement in a "perfectly waterproof and airtight shed." In Clause 22 the term "coarse material" had been inserted to avoid the ambiguity of the word "aggregate." With regard to the materials to be used, the committee had followed fairly good practice. They had avoided some which were not suitable for the exacting conditions of reinforced concrete. Clause 30 departed a little bit from the R.I.B.A. report of 1912, the reason being there was some difficulty in obtaining the results required to pass the R.I.B.A. test. If the work falls below the suggested lowered standard it should not be passed. The form of bar illustrated in Clause 50 should strictly be a U and not a J. With regard to the protection of the concrete, it should be borne in mind that one disaster in reinforced concrete work may mean the loss of 100 potential orders, for there is a disposition to look on all such construction with doubt amongst those who have never had any experience of it. It is up to members of the Concrete Institute to prevent all failures. The committee have left it

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.

AN OAK BUFFET FROM THE ROW, WATERGATE STREET, CHESTER. Belonging to Mr. G. H. FENNAH.
Measured and drawn by B. FRASER

open whether the test pieces for ascertaining crushing resistance shall be 4 inch or 6 inch cube; in his opinion the 6 inch would give the better result.

Mr. S. Bylander, chairman of the other committee concerned in the preparation of the draft, explained with reference to tests that it was left to the engineer or architect to fill in the percentage proper for any particular job, the amount differing whether it is a big or a little one. It would generally vary from ½ to 1 per cent. It was fairer to the contractor that he should know what he has to set aside for the manufacturers' test to be carried out at the yard. The engineers' tests should be paid for by the employer. Of course, the phrase "airtight" in Clause 18 meant airtight as far as possible. The best test for steel and the simplest is undoubtedly the bending test.

Professor Adams, the President, explained that some of the clauses here given are alternative, therefore a choice would have to be made when the time comes. Thus the use is contemplated of either ordinary steel or high carbon steel.

AN OAK BUFFET, FROM THE ROW, WATERGATE STREET, CHESTER.

THE Row in Watergate Street is the venue of all the antique furniture collectors visiting Chester, for there are many dealers there.

This old oak buffet is from "God's Providence House," being quite a genuine old piece of furniture, and consists of two long cupboards, the bottom one being very high with a row of three drawers over and surmounted by a low top cupboard set back from these, leaving a shelf about 6 inches wide. The top projects from this low cupboard to line with

Digitized by Google

the lower part, and is supported by two huge melon bulb supports, this construction being quite the usual one for these old dressers.

Its date will probably be about 1690, for the design and workmanship is of this period, the great point noticeable being the absence of mitres, which is characteristic of the time.

BUILDING BY-LAWS AND A COURT OF APPEAL.

A MEETING of the Institution of Municipal and County Engineers was held at the offices, 92 Victoria Street, Westminster, on the 5th inst. Mr. J. S. Pickering, Cheltenham, President, was in the chair. The subject for discussion was the following paper, submitted under the above title by Mr. H. D. Searles-Wood, F.R.I.B.A.:—

The resolution that was passed at the Royal Sanitary Institute Congress, in 1913, was: "That the Council of the Royal Sanitary Institute be requested to urge on the Local Government Board the desirability of the establishment by the Board of a tribunal of appeal from the decisions of local authorities on points relating to practices in the working of the Building By-laws, and should they consider that Parliamentary sanction is necessary for the formation of such a tribunal, to take steps to obtain such sanction."

I have been asked to read a paper on this tribunal of appeal, and I gladly avail myself of the opportunity, as I think that there is in some minds a misapprehension of the purpose for which this tribunal is to be appointed. The suggestion was that, in the event of a difference of opinion arising between the authority and the building owner as to the suitability of his design and the construction of the by-laws, the building owner should forward his drawings to the Local Government Board, with a statement of the argument he put forward why the local authority should pass them, and the local authority should state their reason for objecting; the decision of the Local Government Board should be binding on all parties, and there should be no reason why the matter should not be dealt with promptly and with little trouble. I am aware that the Local Government Board always decline to give a legal interpretation, as that is a matter that the Courts must settle, but this reference that I suggest would in most cases be as to the reasonableness of the objections, and would not necessarily involve the legal construction of the by-laws, but simply the usual reading of it, with which the Local Government Board would be familiar.

It appears to me that such a tribunal would be more impartial than any local court, and, being a technical body, the decisions would carry more weight, and in course of time these decisions would form a series of precedents which would be of great assistance to both local authorities and building owners.

There has been a tribunal of appeal in the London Building Acts for many years, and it is constituted, in the 1894 Act, as follows:

"One member shall be appointed by a Secretary of State.

"One member shall be appointed by the Council of the Royal Institute of British Architects.

"One member shall be appointed by the Council of the Surveyors' Institution.

"No member or officer of the Council (i.e. London County Council) shall be a member of the tribunal of appeal.

"Members of the tribunal of appeal shall be appointed for a term of five years, and any such member shall be eligible for re-appointment.

"It shall be lawful for the Lord Chancellor, if he think fit, to remove for inability or misbehaviour, or other good and sufficient cause, any member of the tribunal of appeal.

"Upon the occurrence of any vacancy on the tribunal of appeal, or during the temporary absence through illness or other unavoidable cause of any member thereof, a Secretary of State, the Council of the Royal Institute of British Architects, or the Council of the Surveyors' Institution (as the case may be), whichever of them shall have appointed the member of the tribunal whose place shall be vacated, shall appoint forthwith a fit person to be a member (either temporary or permanent) of the tribunal, in lieu of the member whose place is vacated, or who is temporarily absent as aforesaid.

"Each member of the tribunal of appeal shall be entitled to such remuneration, either by way of annual salary or by way of fees, or partly in one way and partly in the other, as a Secretary of State may from time to time fix.

"It shall be lawful for the tribunal of appeal to appoint such clerks, officers, and servants as they may find necessary, who shall be paid such salaries as shall be determined by the Council, and to provide offices and to obtain such professional advice and assistance as they may find necessary.

"It shall be lawful for the Council (*i.e.*, L.C.C.) to defray the expenses of supporting any decision of the Council or of the superintending architect or of their engineer or of a district surveyor by counsel and witnesses before the tribunal.

"It shall be lawful for the tribunal at any time to state and the tribunal shall if ordered by the High Court, or a judge thereof, on an application in a summary manner of the High Court on any question of law involved in any appeal submitted to them. The High Court shall hear and determine the question or questions of law arising on any case stated by the tribunal of appeal, and shall thereupon reverse, affirm, or amend the determination (if any) in respect of which the case has been stated, or remit the matter to the tribunal of appeal with the opinion of the Court on the case stated, or may make such other order in relation to the matter as the circumstances of the case require, and may make such order as to the costs of the case and in the High Court as to the Court may seem fit.

"The tribunal of appeal shall, subject to the provisions of this Act, have jurisdiction and power to hear and determine appeals referred to them under this Act.

"For all the purposes of and incidental to the hearing and determinations of any appeal the tribunal shall, subject to any rules of procedure duly made, have power to hear the Council (L.C.C.) and the parties interested either in person or by counsel, solicitor, or agent as they may think fit, and to require the production of any documents or books and to confirm, or reverse, or vary any decision and make any such order as they may think fit, and the costs of any of the parties to the appeal, including the Council, shall be in the discretion of the tribunal.

"The tribunal of appeal may from time to time, subject to the approval of the Lord Chancellor, make regulations consistent with the provisions of this Act as to the procedure to be followed in cases of appeal to the tribunal including the time and notice of appeal and as to fees to be paid by appellants and other parties.

"Any order of the tribunal of appeal may be enforced by the High Court as if it had been an order of that Court.

"All fees and sums of money paid to the tribunal of appeal shall be paid over to the Council and carried to the county fund, and the salaries or fees payable to members of the tribunal and the office and establishment expenses of the tribunal and expenses incurred by the tribunal and the Council in reference thereto shall be defrayed out of the county fund."

I have set out these clauses in full so as to give some idea of the way the tribunal of appeal under the London Building Acts is constituted. I do not suggest that it should be a precedent for the tribunal of appeal for the model by-laws, but it has been found to work well in London.

One of the points for discussion might well be as to the way in which the tribunal should be constituted.

With regard to the arguments in favour of such a tribunal, it seems to me, judging by many of the suggestions that are made in papers on the amendment of the by-laws that there is a wrong impression of the principle upon which by-laws are founded. We are a free people, and there is a common law right for every man to build as he likes on his own land.

The very interesting *Liber Albus* of the City of London, a collection made during the mayoralty of Sir Richard Whittington, of documents, even then ancient, contains FitzAlwyne's Assize of Buildings, written in 1189. It has the following passage on the obstruction of the view from windows. "If any person shall have windows looking upon his neighbour's land although he may have been a long time in possession of the view from such windows aforesaid, nevertheless his neighbour may lawfully obstruct the view from such window by building opposite the same, or by placing anything there upon his own lands in such manner as may to him seem most expedient unless the person who has such windows can show any writing by reason whereof his neighbour may not obstruct the view from these

Digitized by Google

windows." This shows that the right to build as the owner liked existed in those days.

The by-laws are only concerned with the safety of the public and not of the owner. This is shown by the exempt building clauses, which to some extent are wider in the Metropolitan Building Acts than in the Model By-laws. Before 1875 the by-laws only regarded the safety of the public from two standpoints, that is, fire and stability. After the Public Health Act it was recognised that the sickness of the occupier might be a menace to the public, and the sanitary aspect was added to the other two. The Amended Rural By-laws recently issued, which were based largely on the suggestions made by the Royal Institute of British Architects, clearly show the three points of view of the safety of the public. As I read the suggestions made in the various papers to amend the by-laws, this is not the idea of their authors, but they want to make the Building By-laws a complete code of building construction, which is impossible. The Local Government Board have at present before them the London County Council By-laws for Reinforced Concrete Construction, which, when approved, will, I think, be largely used all over the country for reinforced concrete regulations. Anyone who makes a careful study of these rules will at once see that they require very expert knowledge to construe them, and that it would be hopeless to take a dispute, as to whether the design objected to was properly designed, before the local Courts. And it is with this in view that I strongly urge the formation of an expert tribunal that could give an unbiassed opinion that would carry weight in such disputes as are certain to arise. I am quite ready to admit that the knowledge of the stresses and strains in buildings has improved very much of late years, and the ability to calculate these reactions is possessed by a great many officials; but as this form of construction is rapidly coming more and more to the front, and ingenious forms of its application are constantly being designed, it is difficult for those officials, who have so many other duties besides surveying, to keep abreast with the times. Experience in the carrying out of this form of construction is very essential to the appreciation of new forms of design.

Some people are of the opinion that the time has come when there should be a general Building Act for the whole country. Let us hope if this comes to pass that it may be so drawn as not to stereotype existing methods of construction, but stimulate new and better methods than at present. It might be a good thing to encourage architects to work out the strains and stresses in their structures by making a law that the methods of calculating the designs should be submitted to the district surveyor, and if found correct the construction should be allowed, and thus do away with all those cast-iron schedules and rules that so often hamper an original design.

The other point that I wish to touch on is the law as to party structures.

The rules laid down in the Metropolitan Building Act of 1854 for dealing with the rights of the building and adjoining owners of a party wall have worked so well that it is surprising no other city or town has adopted the same system, which is, briefly, as follows:—

Where a building that has party walls is about to be rebuilt the building owner serves on the adjoining owner of the party wall notices which describe the work that is to be done to the party walls, and in this notice the building owner appoints a surveyor to represent him. If the adjoining owner does not agree within fourteen days of the service of the notice, a difference is said to have arisen, and the adjoining owner appoints a surveyor to represent his interest, and these two surveyors meet and appoint a third surveyor.

The first two surveyors then examine the party structure and draw up an award, in which is set out the work that has to be done, and when this award is signed by the two surveyors it is published and the matter is settled. Should the two surveyors not be able to agree on an award, the third surveyor is called in, and within seven days he has to appoint a day for a hearing, and the three surveyors meet and any two of them can agree on an award, which, when signed by the two, is published and becomes a binding document, only to be upset on appeal before a magistrate. The position of the third surveyor is not quite that of an arbitrator, he is only equal in rank to the other two surveyors, but it has been found to work well, and many awards are made by means of the third surveyor which could not be made between the two surveyors in the first instance.

The third surveyor, being quite impartial, can complete the award which one of the interested surveyors would not care to sign. This method of dealing with a difficult situation is really a great help to architecture, and some such system should be part of the Statute law. At present the law on the subject is that the party structure is common with the two parties, the building and the adjoining owner: it cannot be touched without the assent of both parties, and there is no means of compelling this consent. It is in this respect that the London practice has such great advantages.

The term "party wall," though often used merely with the signification of a wall separating adjacent buildings, means, in its general sense, and is properly applicable to, any wall which parts or divides adjoining lands, whether built upon or not, held by different owners. With regard to ownership and rights of user the term may be used in four different senses. It may mean

(1) A wall of which the adjoining owners are tenants in common.

(2) A wall divided longitudinally into two strips, one belonging to each of the neighbouring owners.

(3) A wall which belongs entirely to one of the adjoining owners, but is subject to an easement or right in the other to have it maintained as a dividing wall between the two tenements.

(4) A wall divided longitudinally into two moieties, each moiety being subject to a cross-easement in favour of the owner of the other moiety.

But the most ordinary and primary meaning of the term is a wall of two adjoining owners who are tenants in common.

The common user of a wall separating adjoining lands belonging to different owners is *prima facie* evidence that the wall and the land on which it stands belong to the owners of the adjoining lands in equal moieties as tenants in common. And when a wall has been erected at a joint expense of adjoining owners, and held and used by them in common, it seems clear that in the absence of evidence to the contrary a jury would be directed to find that the wall and the land on which it stands were held by the two owners as tenants in common. In the first case the defects of the law as it stands are that nothing can be done to the wall without the consent of the adjoining owner, and there is no power to compel him to give his consent. If the wall be out of repair and one owner repair it, he cannot compel the other owner to contribute. In the second case, where the wall is divided into two strips, either strip can be removed without the consent of the owner of the other strip, and without regard to the efficiency as a party wall of the other portion. But there may be a right to lateral support. The right of the one house to lateral support from an adjoining house generally has its origin in two or more houses having been built by the same owner at the same time. The right of lateral support may also be derived from an express grant, or it may be claimed by prescription.

When the wall is a party wall in the third sense, a wall which belongs entirely to one of the adjoining owners but is subject to an easement or right in the other to have it maintained as a dividing wall, or where a wall is a party wall in the fourth sense—viz. a wall divided longitudinally into two moieties, each moiety being subject to a cross-easement—the owner of the servient tenement is not, unless the duty is cast upon him by express stipulation, bound to repair; the easement being for the benefit of the owner of the dominant tenement, it is for him to do the necessary repairs, and it is considered that he will have the right to enter upon the servient tenement for that purpose. But in the fourth case, if either party took down his own moiety, he would be liable to an action in respect of any damage which might thereby result to his neighbour.

When one of two adjoining owners builds a house so that one of its external walls stands upon the ground of his neighbour, the owner so building will, in due time, acquire a title to such wall under the statute of limitations, for possession of the house is possession of the wall, which is but a part of the house. But in such a case the owner of the land can, at any time before the statutory period has elapsed, bring ejectment and recover possession of such site with the wall thereon. But when a man erects a building against his neighbour's wall, utilising it for the purpose of support, and has a covering for one side of such building, he will not by lapse of time obtain a statutory title to the wall, for it does not form part of the building so erected, but is merely an abuttal thereof, and cannot be considered as in his exclusive occupation or possession. But

Digitized by Google

he would, after the lapse of twenty years, become entitled at least to an easement of support from his neighbour's wall and his roof and other analogous rights. A wall may be in part of its length a party wall, and in part of its length an external wall, and there is no distinction between height and length. A wall may be a party wall up to part of its height, and may be an external wall for the rest of its height.

DISCUSSION.

Mr. Edward Willis (Chiswick), in proposing a vote of thanks, said there was one point raised in Mr. Searles-Wood's paper which he would like to refer to—namely, the assertion that where a man builds an external wall and it happens to abut on his neighbour's external wall he acquires a prescriptive right to support. It sounded fair and reasonable that it should be so. In discussing any suggested building legislation it should be remembered that a thing extremely useful in London would not be so useful in the country, where the circumstances were so different. They all appreciated the County Councils and their engineers; but he was not sure it would be desirable to throw more work on the surveyors in advising the County Councils on these matters. Again, ought local authorities to have discretionary power in regard to the by-laws? There was none at the present time. Mr. Searles-Wood had stated, "The by-laws are only concerned with the safety of the public, and not of the owner." Personally he considered they very largely covered the safety of the occupier. Engineers occasionally came across youthful architects, not so brilliant as the reader of the paper, whose plans, as submitted, invited disaster. The time was no doubt coming when there will be required reinforced-concrete by-laws, though it was better to sit on the fence for the moment. While a general Building Act for the whole country would be very useful, it would be impossible to get over the fact that what was suitable in one town or district might be totally unreasonable in another. Any general Building Act would have to contain special regulations for certain districts. The constitution of the existing tribunal of appeal in the London Building Acts was, of course, very excellent, and it has worked admirably.

Mr. A. E. Collins (Norwich) declared he was a great believer in appeals. Anyone who had to carry out by-laws knew what the difficulties were. Sometimes quite reasonable proposals have to be negatived because of the way in which the by-laws must be administered. He was afraid, however, it would be an impossible situation to have by-laws and then not carry them out whenever such a course seemed desirable. Local authorities ought to be able to insist upon actual compliance. But anyone who felt dissatisfied should have a court of appeal. The various County Councils, however, would be the worst court possible. The general lines of the existing tribunal under the London Building Acts would do for the country as a whole. The by-laws ought to vary in different localities, thus a densely crowded area being differently controlled to a thinly populated one. One code might apply to the entire country, but with different sections. Sanitation and stability should be completely provided for. They were promised by-laws on the L.C.C. pattern for reinforced-concrete construction, but reinforced-concrete buildings were even now springing up in rural areas, and, moreover, it was unfair to expect a rural surveyor to be able to handle the L.C.C. code.

Mr. Norman Scorgie (Borough Surveyor, Hackney) considered that a good deal of misconception existed in reference to London's tribunal of appeal. It had nothing to do with the construction of buildings; it was only a place of appeal from any act of the London County Council in respect of certain powers they possessed. The tribunal did not deal with ordinary buildings which came under the Building Acts and the district surveyors. In his opinion the giving of discretionary powers under the by-laws would be a very unwise thing, for influence would inevitably be brought to bear on the official. But if the local surveyor can say definitely, "These are the by-laws and they must be obeyed," all goes smoothly. Such discretionary powers would not conduce to the better government of this country, the promotion of sanitation, of healthy dwellings, or the health of the public. He had been told by architects experienced in reinforced-concrete building that if the rules as forwarded by the L.C.C. to the Local Government Board are insisted upon it will be cheaper to build in brick or stone.

Mr. W. R. Davidge, A.R.I.B.A., F.S.I., pointed out that the tribunal of appeal possessed power of alteration from the decision of any London district surveyor. The fact of there being that provision ensured that the law will be wisely administered throughout the country. If power of altering by-laws was granted it could not in fairness be left to small local authorities, but only to some independent body. They would all agree that a local authority should have definite rules to work to: but they should be relaxed in exceptional cases. Division by zones was one method. The proposed tribunal of appeal was the ideal towards which they should work. The existing London tribunal was much talked about, yet it does very little—probably not more than two or three cases in a year—yet there are 40,000 jobs each year in the Metropolis. The London County Council is itself a tribunal of appeal, and they can allow modifications. Since the first London Building Act of 1189 there has been an almost consistent sequence of Acts. The 1707 Act was responsible for many of the existing ridiculous clauses, which were fair enough at a time when there was nothing more than the "village squirt" in the case of fire.

Mr. T. R. Smith (Kettering) said that, speaking as a country member, he would be pleased to see some tribunal of appeal. But it would have to be other than the County Councils, which were composed mainly of country gentlemen, who knew nothing about such matters. Personally he would prefer the Local Government Board.

Mr. Jenkins said that local authorities could not possibly be their own tribunal in deciding cases, especially in their own district. Sometimes it was extremely difficult to know what to do. He had never yet seen a by-law which was a really good one from beginning to end. But he had heard builders declare they would rather go to a district where they would have even harsh treatment—so long as they knew exactly how they stood—than to another where discretionary power was attempted to be used.

Mr. S. G. Turner pointed out that three questions might arise in by-laws: (1) That they were certain and reasonable—purely a question of law, for it depends upon the power which the statute gives to the authority; (2) the interpretation of the by-law; (3) whether in any given case it would be just or fair to dispense with the requirements of the by-laws. There would be a considerable addition to the work of municipal engineers if they or their authority possessed power to dispense with the by-laws. It was important to remember that local authorities enjoyed no more right to dispense with their own by-laws when they were the builders than when other people submitted plans.

Mr. J. S. Brodie (Blackpool) mentioned that he had had upon one occasion to tell his authority they were not allowed to do what they proposed; as a consequence they got a direct dispensation from the Local Government Board from that particular by-law. Surveyors knew perfectly well that enough discretion was taken already without permission. His advice was to give no discretion at all, but to lay down hard and fast lines—otherwise he did not know where they would end. He hoped they would be preserved from a complete code of building construction, for it would shut off enterprise, make everything of a cast-iron pattern, and put this country in the position of Germany.

Mr. F. Wilkinson (Wimbledon) recalled one case where the Board of Education broke the by-laws with impunity. At Wimbledon one of the chief troubles had arisen out of the desire of architects to design their windows very low indeed.

THE ROMAN WALL OF ANTONINE.

IN a paper on "Some Recent Discoveries on the Line of the Antonine Wall," read before the Glasgow Archæological Society, Dr. George Macdonald pointed out that although it was possible to trace the line of the Antonine Wall for a good many miles with very substantial accuracy, there were nevertheless a considerable number of points, and some of them rather critical points, where its destruction had been so complete that we were left without any apparent guidance, and where certainty could only be obtained by properly directed exploration. For two or three years past, with the aid of a research grant from the Carnegie Trust, he had been carrying on, at odd moments, a series of investigations designed to settle the more conspicuous cases of doubt. The Ordnance Survey Department were co-operating with him, and his conclusions were being embodied in all new issues of their maps. After describing the methods employed, and acknowledging the help and kindness he had received from proprietors and tenants, he

Digitized by Google

gave a detailed account of some of the results that had so far been secured, dealing more particularly with the stretch lying between Old Kilpatrick and Duntocher, and with the part in the immediate neighbourhood of Cawder House. In the former case, where the wall had entirely disappeared and only one or two isolated fragments of the great ditch remained visible, all existing surveys were defective or erroneous for the greater part of the distance. Excavation at carefully selected spots had, however, now made it possible to lay down the course of wall and ditch from end to end of the section without a break of any kind. The most satisfactory proof of the correctness of the new survey was afforded by the discovery of the remains of the long-lost fort at Old Kilpatrick. It was situated in a commanding position on a plateau just above the bank of the Clyde, and had apparently been defended by ramparts of turf. The outline of a buried fort had also been recovered in the glebe at Cadder Manse, while the mystery that surrounded the course of the wall here and within the policies of Cawder House had been completely cleared up. Incidentally it had been shown that the fine tumulus, which has so long enjoyed the reputation of being a Roman castellum, had nothing to do with the Romans at all. But it did not thereby lose its interest. It merely became a mediæval, instead of a Roman, piece of antiquity, for it was unquestionably a mote-hill. The estate of Cawder had been fued by the Bishop of Glasgow to Sir Alexander de Strivelin soon after 1180, and it was thus in the highest degree probable that the tumulus represented the original stronghold of the Stirling family, in whose possession the lands of Cawder had remained continuously till to-day. The work done towards the eastern end of the wall was also referred to briefly. A third fort hitherto unknown has been identified beyond Falkirk, and the curious discovery made that for at least four miles of its course the wall was not built of sods, as it was in the west, but of earth between two retaining lines of clay.

REIMS CATHEDRAL.

In a lecture before the Edinburgh Art Guild Professor Baldwin Brown gave an appreciation of this masterpiece of architecture, in which he said that the Cathedral of Reims was on the whole the most perfect monument of Gothic architecture, and as such it might fairly be termed the greatest, most varied, most inspired work of human art. Architecture and the decorative arts had combined in it to produce a masterpiece the only rival to which could be found in a fully equipped Greek temple such as the Parthenon. The Gothic church, however, possessed one element denied to the Hellenic masterpiece, and this was the element of mystery, by which an appeal was made to the imagination. Greek work was absolutely clear and defined, whereas in the mediæval Christian monument that embodied the romantic spirit of the North there was always the suggestion of something beyond, of spaces and details that could not be fully explored and grasped, and this gave the Gothic building its unique impressiveness and interest. The name "Gothic," which had no real significance, had been invented at the time of the Renaissance by the Italian writer Vasari, and was used in the sense of "barbarous" or "uncouth." To the people of the present day, on the contrary, Gothic architecture and decoration represented extreme refinement There was intellectual refinement in the scientific precision, the logical consistency, displayed in the construction, and there was ethical refinement in the humanity and tenderness that gave such a charm to the figure sculpture with which the French cathedrals were so lavishly adorned. The Gothic church possessed another feature of interest that gave it a special importance to a student of artistic history, in that the qualities shown in it were directly expressive of the life of the times. The building was the creation of the twelfth century, and it came into being in the central district of France. This region, under the enlightening rule of monarchs of the modern type, such as Philip Augustus, was at that epoch the theatre of new movements in the political, social, religious, and intellectual spheres, and in the domain of the imagination and of the emotions, and every aspect of these movements had left its impress on the great architectural monuments that were the chief glory of the age. The construction of a church like Reims had been well illustrated by diagrams prepared by French architects. From the interior view the building seemed to consist in a canopy of stone upborne at a great height by a series of slender supports of the lightest possible kind, the intermediate spaces being no longer walls, but a mere screen of coloured glass. When we looked on the outside, however, we saw that there was the same amount of walling as in the earlier styles, but panels, as it were, had been taken out of the walls, turned round at right angles to their original positions, and used as piers for the lateral support required by the vaults. The whole system of Gothic vaulting, with its supports in the form of flying buttresses, was highly scientific, and the materials were very economically disposed.

OLD EDINBURGH CLUB.

At the seventh annual meeting of the Old Edinburgh Club the Chairman, in moving the adoption of the report, said that the book for 1913, which was placed in their hands on the previous day, might be accepted as evidence of the continued virility of the club. In spite of disappointments in two directions, it contained three articles of considerable importance. The first related to the recent discoveries in the Castle, a work which was carried out with considerable acumen and knowledge by Mr. Oldrieve, and it was to his efforts that the ancient castle of David II., with its walls 60 feet high on the one side and 30 feet on the other, was permanently brought to light after its long entombment of nearly three and a-half centuries. The second article on the Incorporation of the Skinners of Edinburgh by Mr. Angus was one of great interest and importance in the history of the city, and he had no hesitation in characterising his paper as a model both in the matter of research and in the style of writing. The third and last article was by Mr. Fairley, who continued his interesting extracts relating to the grim old Tolbooth, which formed so prominent a feature in old Edinburgh life. The volume for the year 1914 would be entirely devoted to a liturgical examination by Mr. Frances C. Eeles, their greatest liturgical scholar, of the book, now in his (Mr. Bryce's) possession, colloquially known as the Service Book of Holyrood Abbey. So far as he was aware, there was only one other book of a similar nature, that on the Arbuthnot Missal, that had hitherto been printed. The volume for 1914 would therefore form, in his opinion, a landmark in the series of their publications. At the present moment they were one year in arrear with their annual volume, and the Council proposed to issue the book for 1914 in the month of September. They also proposed to issue the volume for 1915 in the month of January next, so that during the next twelve months two books would be issued, and their series thereby brought up to date.

For the 1915 book they were well provided with new and important material. It would include an article by Dr. Blaikie on the defence of Edinburgh in 1745; a paper by Mr. R. K. Hannay, Curator of the Historical Department of the General Register House, on the foundation of the University of Edinburgh; the Ancient Church Bells of Edinburgh and its neighbourhood, by Mr. Eeles; a critical paper, also by Mr. Eeles, on the Breviary belonging to the Chapel of St. John the Baptist at the Sciennes; a further article on the sculptured stones of Edinburgh, by Mr. John Geddie; a further contribution by Mr. Fairley of the Tolbooth Extracts; excerpts from the Calendar of Original Documents preserved in the Register House, so far as they related to Edinburgh and its immediate neighbourhood; and an article or two on the Kirk of Field and some of the minor religious establishments in the city, by himself.

They were fortunate in Edinburgh in possessing vast stores of records relating to mediæval times. The Register House with its numerous records and publications, the City Munimenta, the Advocates' Library, and that of the University of Edinburgh, afford ready means of research, and he hoped to receive assistance in that direction from the individual members of the club. It might be of interest to state that Miss Borland, daughter of a minister of the Church of Scotland, had recently been engaged in framing a catalogue of the magnificent manuscripts preserved in the University Library, and that she had been the means of bringing to light a number of historical documents of the utmost importance. These included an early Celtic Psalter with the Celtic Division of the Psalms, and dated either in the eleventh or twelfth century. It bore the inscription in a sixteenth-century hand, "Liber magistri Johannis Reyd, Cancellarij Aberdonensis," and was therefore probably of Scottish origin. It was to be remembered that there was no document in Scotland at the present moment of Scotfish handwriting written prior to the year 1100. There had

Digitized by Google

also been brought to light a very important fragment of a fourteenth-century Antiphoner containing part of the Service for St. Columba's Day, with the ecclesiastical plain chant or Gregorian music. That was the earliest piece of music known to have been written in Scotland. In England many ladies had devoted themselves, with considerable success, to historical research, and it was a great satisfaction to know that Miss Borland, a native of Dumfriesshire, possessed the erudition and determination to tackle the compilation of such a difficult and learned work.

COVENTRY PRIORY.

OUR contemporary the "Coventry Herald" has organised a series of lectures in aid of its Belgian Relief Fund, and in this series the Rev. D. H. S. Cranage, D.Litt., delivered a highly interesting address on "The Old Priory of Coventry."

Dr. Cranage said that at one time Coventry possessed one of the finest cathedrals in the country, and he hoped that now that it was proposed to have a Bishop of Coventry the time would not be far distant when the old glory would be revived, with St. Michael's filling the place of the cathedral. The old cathedral was not what was commonly known as a cathedral, but a priory. A priory was the home of monks, and a monk was a man who retired from the world to work out his own salvation. The order of monks which founded the priory was that of St. Benedict, and they were commonly called the "Black Monks." Of course everyone in Coventry had heard of the Grey Friars and the Black Friars, but most people did not know the difference between a monk and a friar. While the monks were men who retired from the world to work out their own salvation, the friars were men who went out into the world to work out the salvation of others, and they were to be found in the poorest districts, often without buildings of their own. Most monks, said Dr. Cranage, were laymen, the men who corresponded to monks, but who were ordained, being called canons. Another powerful order of monks who had a house in Coventry were the Carthusians, of whose houses there were only nine in existence, one of which was in Coventry. England was unique in having no less than eight cathedrals which were also priories, one of which was the Coventry Priory, this one in Coventry being the only one in England which was destroyed in the Reformation. All the others were still in existence.

The Coventry Priory was first founded as a nunnery by St. Osburg, a virgin of great piety, early in the eleventh century. It was burned down in 1016 by the Danes, and was in a state of non-existence until 1043, when the Lord Leofric and Lady Godiva founded a Benedictine Abbey. Originally, Coventry was in the great Mercian diocese, but later on was merged into the diocese of Lichfield. There were six bishops who called themselves Bishop of Coventry only, and after a time the title became Bishop of Coventry and Lichfield, or the Bishop of Lichfield and Coventry, used indiscriminately. The Priory was situated to the north of St. Michael's, and went under the name of the cathedral church of St. Mary. It was a very large building, its site being bounded by Butcher Row, Priory Row, on the west and south, Priory Street on the east, and the river on the north. The Bishop's palace was to the south of the cathedral, at the north-east corner of St. Michael's Churchyard. Ruins of the extreme west end of the cathedral were still in existence adjoining the Blue Coat School. The only clue as to the style of the structure could be obtained from these ruins and the western tower which still stood, although it had been cased in and so looked quite new, except at the base, where the old structure could still be seen. Brown Willis, writing about the cathedral, said that it was like Lichfield Cathedral, with three spires, only it was of an earlier date, and also was built on a much grander and larger scale, the spires being wider apart and leaving more space for the main building. The site of the nave was now occupied by a graveyard, while the Constitutional Club stood where the south transept was, and the gardens of the club occupied the position of the south transept. There could be little doubt that in the twelfth century there was an organ in the cathedral. Behind the high altar was the shrine of St. Osburg, in which were relics, including, it was said, an arm of St. Augustine.

Coventry was renowned at the present time for its three spires, but in the fifteenth century there were five spires, all clustered together. The domestic building of the Priory, of which scarcely a trace remained, was to the north. The chief part of the cloister was the south walk, adjoining the church. In this walk was the scriptorium, in which the monks did their reading and writing, including the marvellous illuminating work for which monks were famous. Another important part of the building was the chapter house. In the chapter house meetings were held every morning, and the monks confessed the sins of the previous day, and the Lord Abbot meted out suitable penalties, often including corporal punishment. The chapter house of the Coventry Priory had an especial interest in that Henry IV. in 1404 held a Parliament in it. The common house was the only part of the Priory in which the monks were allowed to have a fire. In the west walk of the cloister the novices were allowed to play such board games as "Fox and Goose," and here they also received their instruction. Much had been said about the way monks lived and what they used to eat, but the rule of St. Benedict forbade the eating of the flesh of quadrupeds by all except the sick or delicate, and there could be little doubt that during the earlier years, when the rules were more strictly adhered to, that the monks lived almost entirely upon vegetables. A list of table manners was given to the young monks, in which among other things they were warned against cutting the common cheese without first wiping their knives. The guest house played a most important part in the life of the monastery, it being a rule that all travellers should be welcomed. An interesting rule of St. Benedict governing the welcoming of travellers was that the monks who received the stranger were to prostrate themselves until their foreheads touched the ground just as if the new arrival were Christ. The suppression of the monasteries took place in 1589, and there could be little doubt that the chief bait which tempted Henry VIII. was the large income obtained from the monastic property by the Prior. The Prior of Coventry was a very important person, being a member of the House of Lords.

PORTRAIT PAINTING.*

THE TECHNIQUE OF THE GREAT MASTERS.

By THE HON. JOHN COLLIER.

(Concluded from last week.)

BOTH Rubens and Van Dyck were men of extraordinary gifts, but they were both courtiers and both over-prolific, and their art suffered accordingly. The essential point of the technique of Rubens is his insistence on the transparency of the shadows. He is reported to have said: "Begin by painting your shadows thinly; be careful not to let white insinuate itself into them—it is the poison of a picture except in the lights; if white be once allowed to dull the perfect transparency and golden warmth of your shadows, your colouring will no longer be glowing, but heavy and grey. The case is different in regard to the lights; in them the colours may be loaded as much as is thought requisite. It is necessary, however, to keep them pure. This is effected by laying each tint in its place, and the various tints next each other, so that by a slight blending with the brush they may be softened by passing one into the other without stirring them much. Afterwards you may return to this preparation and give to it those decided touches which are always the distinctive marks of Great Masters."

From this it is obvious that there was no monochrome preparation. The painting from the first was fully coloured. Rubens used a white ground which shone through his transparent shadows and gave them a wonderful warmth and luminosity—often too much. His touch is very liquid, so that he obviously used a very fluid medium. The portraits are altogether a little artificial, but they are very dexterous, and have a most agreeable swagger. He had, as I have said, a tendency to flattery, in pursuit of which he often made the eyes too big—a very fatal fault. Holbein, on the other hand, had a slight tendency to make the eyes too small.

Van Dyck's work at his best is sounder than that of his master. He made less use of transparent shadows, thereby getting much more truth of tone. He was quite as fine a colourist, and, on the whole, a better draughtsman. His technique is to be seen at its best in the portrait of an old man in our National Gallery who is now called Cornelius Van der Geest. He was justly proud of this portrait, and

used to take it about with him as a specimen of his work. The brush work is very dexterous, much more so than in most of his portraits.

Both Ruebens and Van Dyck adopted the pernicious practice of making use of pupils and assistants.

Here is a contemporary account of Van Dyck's usual routine:—

"He never worked longer than one hour at a time on each portrait. When his clock told the hour he rose and made a bow to the sitter, as much as to say that enough was done for that day; after which his servant came to prepare fresh brushes and palette, while he received another person to whom he had given an appointment.

"After having lightly sketched the face, he put the sitter in an attitude that he had previously meditated, and with grey paper and black and white crayons he drew, in a quarter of an hour, the figure and drapery, which he arranged in a grand manner and with exquisite taste. He then handed over the drawing to skilful persons whom he had about him to paint it from the sitter's own clothes, which were sent on purpose at Van Dyck's request. The assistants having done their best with the draperies from Nature, he went lightly over them, and soon produced by his genius the art and truth which we there admire. As for the hands, he had in his employment persons of both sexes who served as models."

I need hardly point out the vices of this system. The marvel is that the work should be as good as it is, but in the last years of his life in England, to which the above description applies, he painted a number of very indifferent portraits. His earlier work during his stay at Genoa, when he probably painted his pictures himself, without much aid from assistants, is very much finer.

The next really important group of portrait painters is to be found in the great British School of the eighteenth century, when Reynolds, Gainsborough, and Romney were all painting at the same time. In their conception of portraiture this group was much influenced by Van Dyck. They had the same tendency towards a sort of courtly elegance, and they were much inclined to flatter their sitters. As painters of men I should judge them distinctly inferior to Van Dyck, but as painters of women much superior. Van Dyck, with all his elegance, never quite got the charm of womanhood—indeed, many of his female portraits are stiff and almost wooden.

But our three great painters had an extraordinary feeling for the grace and beauty of women and children. Never have they been more charmingly portrayed.

With regard to technique, Sir Joshua certainly aimed at reproducing the Venetian manner and colouring, and at his best he was very successful in so doing; but he was always making rash experiments, and was continually varying his practice, with often disastrous results to the permanence of his pictures.

Here is a description of his early practice by an amateur painter who was admitted to his studio:—

"On his light-coloured canvas he had already laid a ground of white, where he meant to place the head, and which was still wet. He had nothing on his palette but flake-white, lake, and black, and without making any previous sketch or outline he began with much celerity to scumble these pigments together till he had produced, in less than an hour, a likeness sufficiently intelligible yet withal cold and pallid to the last degree; at the second sitting he added, I believe, to the other colours a little Naples yellow."

He must have used a fuller palette for the subsequent sittings, but that is not mentioned. It is mentioned that this particular picture "very soon faded, and soon after the forehead cracked, almost to peeling off, which it would have done long since had not a pupil repaired it."

This was in 1754. There is a letter of Sir Joshua's in 1770 describing his practice then, when he was forty-seven years old.

"I am established in my method of painting. The first and second paintings are with oil of copaiba (for a medium), the colours being only black, ultramarine, and white. The second painting is the same. The last painting is with yellow ochre, lake, black, and ultramarine, and without white, retouched with a little white and the other colours." In spite of his saying that he was established in his method of painting, he was continually altering it, but he kept to the main lines—a very cold and bluish preparation, corrected afterwards by warm glazes. As for medium, besides the oil of copaiba, he often used megilp (a mixture of oil and mastic varnish), and a varnish made by dissolving wax in Venice turpentine. He was very fond of this wax varnish, and frequently went over his pictures with it after they were finished.

I may add that he adopted Van Dyck's pernicious system of having a sort of picture manufactory. He had a big house in Leicester Square, with numerous rooms for his pupils, copyists, and drapery men. His pupils served also as models for hands and draperies. With the aid of his assistants he turned out his pictures at a surprising rate. In one year he produced 150 works—about half of what Gainsborough produced in the whole of his life. But Gainsborough had no manufactory—no assistants; his pictures were entirely the work of his own hands. Gainsborough's method was strikingly original. Here is an account by an eye-witness: "I was much surprised to see him sometimes paint portraits with pencils on sticks full six feet in length, and his method of using them was this: He placed himself and his canvas at a right angle with the sitter, so that he stood still and touched the features of his picture exactly at the same distance at which he viewed his sitter."

Velasquez is said to have tried this method of long brushes, but did not persevere with it. Gainsborough probably did. I think it is habitual in his later work. It gives a delightful sketchiness of execution, which sometimes degenerates into mere scratchiness. He made many preliminary sketches for his pictures, sometimes mere scribbles, but at other times fairly elaborate studies. For full-length portraits he would first make a small sketch of the figure in oils before beginning to work on the full-sized canvas. From this sketch he would lay in the complete figure with all its accessories, and then finish from the sitter.

As a portrait painter Gainsborough had many defects. He was not a good draughtsman; his figures are often very faulty in proportion, the hands are habitually badly drawn, and he had a peculiar way of representing eyes—he made them very expressive, but their form was distinctly not that of Nature; also there is rather a fatal family likeness in a good many of his female portraits. And the men's portraits are often flimsy and weak. But no painter has had a greater measure of that very elusive quality, charm. His portraits of women are the most charming in the world.

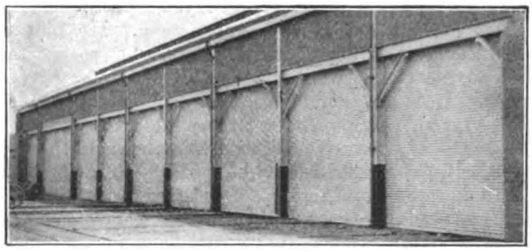
He was a very fine and original colourist, and a master of decorative arrangement. Altogether a most delightful painter, but with limitations.

There is a very interesting appreciation of Gainsborough's work by Reynolds in one of his discourses. He says: "It is certain that all those odd scratches and marks which on close examination are so observable in Gainsborough's pictures, and which even to experienced painters appear rather the effect of accident than design, this chaos, this uncouth and shapeless appearance, by a kind of magic at a certain distance, assumes form, and all the parts seem to drop into their proper places, so that we can hardly refuse acknowledging the full effect of diligence under the appearance of chance and hasty negligence. . . . His handling, the manner of leaving the colours—in other words, the methods he used for producing effect—had very much the appearance of the work of an artist who had never learnt from others the usual and regular practice belonging to his art."

Sir Joshua evidently felt that Gainsborough ought not to have been a good painter, but he had to acknowledge that he was one; indeed, he goes on to say: "It must be allowed that this hatching manner of Gainsborough's did very much contribute to the lightness of effect which is so eminent a beauty in his pictures."

As for Romney, I have been unable to find any contemporary record of his technique.

We will now consider Raeburn, who marks the transition from the eighteenth to the nineteenth century, and whose work has had a surprising vogue of late years. I think myself that Raeburn is a somewhat overrated painter; but he has had undoubtedly a great influence upon modern work. His method is essentially that of Franz Hals. It is extraordinarily direct and very masterly; but the characterisation is not nearly as good as that of Hals, and he mostly misses the extraordinary vivacity of expression that distinguishes the Dutch master.



As in the case of the great painters of the eighteenth century, there is a strong family likeness in his portraits. There are one or two of very different gentlemen which seem almost identical. He was essentially a mannerist, although the manner was very strong and good. Fortunately we know something about his practice. Here are some notes

collected by Sir Walter Armstrong in his monograph on Raeburn:—

1. He seldom kept a sitter more than an hour and a half or two hours.

2. He never gave more than four or five sittings to a head or bust portrait.

3. He did not draw in his subject first with chalk or charcoal, but directly with the brush on the blank canvas.

4. Forehead, chin, and mouth were his first touches.

5. He placed the easel behind the sitter and went away to look at the picture and sitter together.

6. A fold of drapery often caused him more trouble than the build and expression of a head.

7. He never used a maulstick.

From these notes we gather that Raeburn's method was singularly direct. He certainly made no kind of preparation. He aimed at putting every touch on the canvas as right in tone and drawing as he could get it. If he were successful in this it remained unmodified. If it were unsuccessful, it had to be redone. I do not think he repainted the whole head each time, as was Whistler's practice. If a touch was wrong, it was repainted firmly and solidly; if it was right, he left it alone. So that the finished picture is a sort of mosaic of definite touches, each of them apparently put on the canvas with one sweep of the brush. In his earlier works he carried this method so far that his faces look much too hard—as if they were cut out with a hatchet. Oddly enough, Raeburn's work did not become more summary as he grew older, as is the case with most artists. On the contrary, his modelling became much more subtle, and his touch softer and more fused—to the great improvement of his painting.

And now we come to the moderns. I have always considered Millais one of the greatest of modern painters, and I can speak with some confidence of his technique, as I had the privilege of his friendship, and he used to allow me to see him paint.

In life-sized portraits he always put his canvas side by side with the sitter, and walked backwards and forwards the whole length of his studio, putting on a touch, and then looking at it from a distance to see if it was right. If it was not right he would come forward again to modify it; this modification he often did with his finger.

He once said to me, "Get away from your picture till it looks the size of a postage stamp, and then you will see if it is right or not."

He did not draw his picture very elaborately, but he was careful how he put it on the canvas. Having made a rapid sketch of the general attitude, he got to work at once on the head with the full vigour of a rich palette, just rubbing in lightly a little of the background round it. At the end of the first sitting the head looked very much as it at the end of the final one; he only added accuracy and refinement to it. He was not very particular as to his execution; he wanted his painting to look like Nature, and he did not much care how he did it. As he said once, "It doesn't matter how beautifully a thing is painted, it's no good if it isn't right; it's got to come out. What does it matter how you do it? Paint with the shovel if you can't get your effect any other way."

Millais rather despised mere technique—that is, any very definite method of painting—possibly he despised it too much. Mr. Comyns Carr in his recent book, "Coasting Bohemia," relates how: "One day we were talking of technique, and I remember Millais, who was at the time in some trouble with a portrait that he could not get to his satisfaction, roundly declared that for an artist worth the name there was no such thing as technique. 'Look at me, now,' he said. 'I can't get this face right, and it has been the same with me all through my life; with every fresh subject I have to learn my art all over again.'" It was perhaps this absence of a definite technique which made Millais' work so very unequal, but it helped to give him his marvellous freshness and variety. Each portrait is absolutely individual, and has no trace of that fatal family likeness that we find in mannerists such as Raeburn.

A very different painter was Whistler—a man of great natural ability, but who was too much bound down to his method. He took immense pains, but his great preoccupation was to make people think that he did not take any. No matter how many sittings he had—and he generally had a great many—he always wanted his picture to appear as if it had been entirely painted at one sitting. So each time he went over his whole picture and repainted it afresh. As it is impossible adequately to paint a whole portrait at one sitting, he merely spoilt his work, and neglected the more valuable elements of portraiture in order to attain the quite secondary advantage of an agreeable sketchiness.

In other respects his method was sound enough, and had the merit of extreme simplicity. I have been given some very interesting notes as to Whistler's technique by a well-known artist who worked for some years in his studio.

"He puts the picture side by side with the sitter. The canvas had a grey preparation made with black and white mixed with turpentine. He did not use a palette, but had a table near him, on which he mixed the tones he was going to use. This was a very important part of his practice; before actually painting his picture he mixed with great care a quantity of the tones he would require, such as background colour, floor colour, coat-colour in the light, ditto in the half-tone, ditto in the shadow; flesh colour in the light, in the half-tone, and in the shadow; hair colour in the same way, &c. He had a mixture of oil and turpentine in a saucer standing on the table. Using this as a medium, he covered thinly the whole canvas with these prepared tones, using house-painters' brushes for the surfaces, and drawing lines with round hog's-hair brushes nearly a yard long. His object was to cover the whole canvas at one painting—either the first or the hundredth. When a thing was incomplete, he did not try to patch it; he did it all over again and again, till it was finished, or wrecked, as often happened, from the sitter getting tired or growing up or growing old.

"He would put the mixtures in little gallipots of water round the table, so that he could depend upon taking up the same tone another day.

"For many of his portraits he used a quite black background. He had a square of black velvet nailed on to an easel, which he wheeled about. The lighting was always subdued; his sitter posed far away in the penumbra of the studio, and never under a direct light. He said he hated high lights in a picture."

What was best in Whistler's practice was his intense preoccupation with the tones; and be it observed that these very delicate tones, that in his best work are so beautifully harmonious, are put on in the simplest possible way—just ordinary paints carefully mixed, and then put on thinly with a big brush. I think this is a sufficient refutation of the theory that "quality" in painting can only be obtained by broken colour, or by glazing, or scumbling, or other tricks. Whistler's work has a very fine quality, and it is obtained by the simplest possible means. If only he had not spoilt it all by his mania for repainting the whole picture each time, he might have obtained results not so very unworthy of Velasquez, whose method was also completely simple, but far more rational.

And now we come to the greatest of modern portrait painters, John Sargent. Sargent is like the old painters, in that he has a very definite method of which he is completely master. There is very little that is tentative about his work. He knows what he wants to do, and also how to do it—a quality which is very rare in modern art, where most of us are fumbling and bungling with no clear aim and no settled method.

As I have said, Mr. Sargent's work is undoubtedly founded on that of Franz Hals. It has the same quality of sureness of touch combined with great delicacy. In this, indeed, he excels his master; there is much more delicacy in Sargent's flesh tones and more refinement of drawing. Also he has a feeling for beauty in which Hals was almost lacking. But there is a vigour and a directness in the older master and a vivacity of expression that even Sargent does not always equal. I feel some diffidence in giving an account of Sargent's technique, as it does not come direct from himself. He wrote to me about it very kindly some years ago, and this is what he said: "As for describing my procedure, I find the greatest difficulty in making it clear to pupils even with the palette and brushes in hand and with the model before me, and to serve it up in the abstract seems to me hopeless. It is less a technical process than an order in which to proceed.

That is, he carries out the painting in a certain definite order. Of course, this order is very important, and I do not despair of elucidating it. Mr. Sargent has taught with great success in the Academy schools, and I have been given some notes of his procedure by one of his pupils, which I think are quite trustworthy. This was the procedure:

"First, a careful drawing of the masses of hair, face, collar, coat, &c., together with the correct placing of the subject on the canvas, with spots giving the exact location of the features. Secondly, using a large brush with plenty of paint, put in the tone and colour of the background as

nearly correct as possible, letting the background well overlap the borders of the portrait. Thirdly, a kind of middle tone of the flesh is painted over the whole flesh space—light on the light side, dark on the dark side—painting the tone right into the background (background into flesh, flesh into background, until the effect of the truthful blending or melting of the one into the other is obtained); so with the hair and flesh and hair and background. When this is finished the head has something the appearance of a wig-maker's block. Of course, the drawing round the borders of the masses must be very thorough, not only in the pattern of its mass but in the coming and going of the edge—as true to Nature as it is possible to get it. The broadly graduated tone from the light side to the dark must be truthfully expressed. There are as yet no features. With the canvas arranged by the side of the sitter, and going to the full length of the studio, this preliminary painting is carefully tested from the point of view of drawing, colour, and tone.

"It is then carefully noted where the broad tones of the features should be placed in relation to all that has been done. The broad tone, in which may be said to dwell the eye, is then painted into the big middle tone while wet and fresh, being careful to have it right in colour, tone, and drawing, that on the light side differing from that on the dark side exactly as it is in Nature. It will then have the effect of a receding plane.

"As with the eyes, so with the nose—a kind of middle tint between the light and dark side to indicate its form and place; so with the nostrils, again with the mouth and chin, continually viewing the progress of the work from the far end of the studio.

"Then follow the various relationships in tone of the darks, subtly cast shadows and the like, vigorously brushed into the wet paint, and then the lights in their various relationships, until the whole appears to be true in tone.

"This would all be the first day's work. It is left to dry, and on resuming is oiled out carefully and well brushed with a dry brush to remove all superfluous oil.

"The whole picture is then thoroughly criticised, and the same ground gone over in much the same way, using as far as possible the work of the first painting by working thinly over it, never forgetting that the tones must be brushed fearlessly and well, the one into the other (sometimes the light into the dark, sometimes the dark into the light), so that the two fuse together and are felt as a continuation of the same substance."

To these notes I have an important addition by another student, viz., that at the end of the day everything should be brushed together whilst the paint is wet in order to get rid of all sharp edges. So that we are getting somewhat near to the indeterminate blur of Franz Hals—to be followed, of course, by the decided touches which, as Van Dyck said, give, as it were, the handwriting.

The method of Sargent is so predominant in modern art that most of our clever young painters seem to adopt it in some form or other—at least, those of them who have not degenerated into pure freakishness, of which there are, alas! far too many. It certainly has wonderful results in the hands of its originator, but it is a difficult method, and it has this danger—that the cleverness of the painting seems often to attract more attention than the rendering of the personality of the sitter. Indeed, the followers of Mr. Sargent are so desperately anxious to be clever that they often forget to be good. With many of them the method degenerates into mere pretentious sloppiness. Mr. Sargent is a genius, and a genius must go his own way; but those of us who have no genius (and there are still a few left) had better avoid the difficulties with which he plays so easily and so deftly.

THE death of Mr. John J. Smith, A.R.I.B.A., architect and surveyor, of Bideford, North Devon, occurred on Sunday, January 31. We understand that the practice is for disposal, together with office, dwelling-house, &c.

AT the R.I.B.A. general meeting last week the chairman, Mr. George Hubbard, F.S.A., Vice-President, announced that the Council proposed to submit to his Majesty the King the name of the Canadian architect, Mr. Frank Darling, as a fit recipient of the Royal Gold Medal for the current year. Mr. Darling is of the firm of Messrs. Darling & Pearson, of Toronto, examples of whose work were shown by Mr. F. S. Baker, F.R.I.B.A., among the slides illustrating his paper on "Canadian Architecture" read at the Institute two years ago.

Correspondence

[The Editor will not be responsible for the opinions expressed by Correspondents.]

Some Work of Thomas H. Mawson.

SIR,—Your correspondent Mr. James Crossland has so evidently lost his temper over my review of his master's work that I should not trouble to notice his letter but for some misstatements. First, his statement that my article "implies that Mr. Mawson has left his proper sphere as a garden designer to dabble in town planning" is quite incorrect. I am aware that Mr. Mawson is still a garden designer. The fact of his being so is no bar to his being also a town-planner, nor, as Mr. Crossland seems to think, any slur on his ability in the latter capacity.

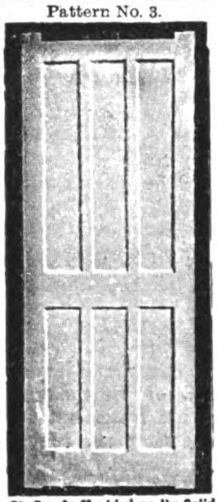
With regard to the Exeter scheme, I do not make the assumption with which Mr. Crossland credits me. I gather from the report on the scheme that a slum clearance was already determined when Mr. Mawson started his plan, and that he has extended the area to be cleared. In this my article is explicit that I think he has acted wisely. I am afraid Mr. Crossland is reading into my words local criticisms of his master's scheme which I have not expressed or suggested.

Mr. Crossland is quite entitled to the opinion that I ought to know more of Canada than I do. Perhaps the same may be said of most Englishmen. But although I have not seen the whole of Canada, I have been there and I know something of its conditions. Knowing what I know, I still hold to my opinions on Mr. Mawson's Ottawa scheme.

The most erroneous, as well as the most absurd, of Mr. Crossland's misstatements is that my final paragraph is an "effort to prevent the firm"—for which he works—"ever getting any more town planning to do." I can understand Mr. Crossland's loss of temper if he fancied that such a result would ensue. But my whole position is that Mr. Mawson's work is worthy of the attention of town-planning students, and my caution to them is that they cannot learn all about town planning from the reports in question. To a certain extent Mr. Crossland confutes me by giving away the show, and letting out the fact that the firm for which he works did not furnish estimates of the cost of their schemes, which are therefore, so far, purely academic studies.—Yours faithfully,

THE WRITER OF THE ARTICLE.

Loot from Louvain?



SIR,—I have read in one of the dailies of the 3rd inst. that besides the great painting in the Cathedral at Ghent having been despatched, among other loot from Belgium, to the Museum at Berlin, where it now hangs complete, the valuable illuminated manuscripts, if not the library books as well, of Louvain University are probably there too—sent off before the sacking and burning of the town.

The statement would seem almost too good to be true; but if it should turn out to be a fact, then there is only the constructional loss of the building to deplore in connection with it, though the venerable rector was deliberately murdered along with several professors and priests of the town separately from the wholesale butchering of the fleeing population by the wine-sodden, undisciplined, armed rabble. If the treasures have not perished in the flames they will have to be returned to the University authorities at the signing of peace, but the precious lives can never be handed back.—Yours faithfully. JOHN A. RANDOLPH.

WE regret to announce the death of Mr. W. J. Cutbill, chairman of Claridge's Patent Asphalte Company, Ltd., which occurred on the 27th ultimo. It seems only a few weeks ago that Mr. Cutbill was prominent in a reception given by the company to inaugurate their new offices at 3 Central Buildings, Westminster, S.W.

THE
Architect and Contract Reporter.
FRIDAY, FEBRUARY 12, 1915.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addresed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than* 2 P.M. *on Thursdays.*

COMPETITIONS OPEN.

BRADFORD.—March 31.—The Corporation invite competitive designs for the re-planning of streets in the central area of the City of Bradford. Mr. Reginald Blomfield, R.A., will act as assessor. Particulars may be obtained on application to the undersigned, accompanied by a deposit of £1 1s., which will be returned on receipt of a *bonâ-fide* design. Mr. Frederick Stevens, Town Clerk, Town Hall, Bradford.

COVENTRY.—The City Council invite competitive sketch plans for the erection of a public elementary school at Folly Lane, Coventry. The competition is strictly limited to architects practising in the City of Coventry. Particulars of the competition may be obtained on application at the Education Office, 44 Bayley Lane, Coventry.

CONTRACTS OPEN.

THE ONTARIO WORKMEN'S COMPENSATION ACT.

THE Ontario Workmen's Compensation Act, which, after an exhaustive investigation of similar legislation in other countries, was adopted by the Ontario Legislature last year, came into operation on January 1. The Act is in itself a scheme of insurance for manufacturers. Under the Act every manufacturer in Ontario is assessed a certain amount per annum. The amount is fixed by the number of men he employs, and by the hazard of his line of industry, as determined by the schedule in the Compensation Act. Out of the common fund so accumulated are paid all claims from workmen who meet with accidents in the course of their industrial duties. There is no appeal to the courts from the findings and awards of the Workmen's Compensation Board. Thus the Act comprises a complete plan of insurance which requires no reinsurance with the employers' liability and accident companies. In practically all cases employers are cancelling their insurance contracts with these companies upon expiration. The purpose of the Act is not to build up a big reserve fund, but to arrive at a basis of assessment which simply provides for compensation requirements. If this is accomplished Ontario employers of labour will, of course, have the benefits of cheaper insurance than that which is now afforded them by the insurance companies.

PATENT SPECIFICATIONS PUBLISHED FEBRUARY 4, 1915.

Selected by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

No. 22,952. Oct. 11, 1913.—Walter Jones, J.P., and Jones & Attwood, Ltd., Titan Works, Amblecote, Stourbridge. Apparatus for the aeration of sewage and other foul liquids.

29,366. Dec. 20, 1913.—Craven Bros., Ltd., Frank Gardner, and A. E. Horrocks, Vauxhall Works, Manchester. Limit switches employed to control the movements of electrically operated cranes, hoists, freight and passenger elevators, winches, turntables, and the like.

417. Jan. 7, 1914.—A. F. Harrison, "Tilecot," Curzon Road, Weybridge, and O. L. Peard, 42 Dingwall Road, Croydon, and Chas. Oliver, 3 Shepherds Green, Chislehurst, Kent. Water heaters or the like for domestic or other purposes.

472. Jan. 7, 1914.—John Barron, 52 Cowcross Street, E.C. Channel bends and the like for inspection chambers.

569. Jan. 8, 1914.—A. H. Phillips and C. G. Arnold, c/o Coup, Phillips & Co., 13 Clerkenwell Road, E.C. Opening and closing devices for fanlights, casements, and the like.

782. Jan. 12, 1914.—F. P. Candy, The Homestead, Mulgrave Road, Sutton. Supply of re-agents in the purification of water.

1,053. Jan. 14, 1914.—Frank Pascall, of the Interoven Stove Company, Ltd., 156 Charing Cross Road, W.C. Auxiliary grates for domestic stoves.

1,106. Jan. 15, 1914.—Robert Brodie, 8 Fettes Row, Edinburgh. Device for preventing down draft in chimneys.

1,124. Jan. 15, 1914.—E. R. Calthrop, Eldon Street House, Eldon Street, London, and F. G. Lynde, "The Eaves," Picardy Hill, Belvedere. Construction of pipes, conduits, sewers, and the like.

1,217. Jan. 16, 1914.—Richard Ames, 145 Ditchling Road, Brighton. Manhole frames and covers therefor.

2,990. Feb. 5, 1914.—Harrison Brotherton, Brierfield, Harboro' Road, Aston-on-Mersey. Flexible curve devices for drawing offices and other purposes.

6,139. March 11, 1914.—E. E. S. Jones, 87 Hartshill Road, Stoke-on-Trent. Cranks or supports for glazed tiles during the process of firing.

7,145. March 21, 1914.—O. C. Hawkes, Globe Works, Bromsgrove Street, Birmingham. Heating elements of electric stoves.

9,191. April 14, 1914.—G. G. Brodie and A. B. Coleman, Eagle Foundry, Catherine Street, Aston, Birmingham. Kitchen or cooking ranges.

10,544. April 29, 1914.—C. A. Woolton, 179 Nag's Head Road, Ponders End, N. Fastener for attachment of window sashes, French windows, doors, and the like.

20,745. Oct. 9, 1914.—G. L. Allen, 113 West Regent Street, Glasgow. Hollow filling blocks for concrete or other floors.

16,553. July 11, 1914.—H. F. Wilson, Carlton Works, Armley, near Leeds. Water heaters.

16,655. Feb. 28, 1914.—J. A. Hughes, 20 Redcross Street, Liverpool. (Communicated by William Hughes and P. C. Rielley, 1 Balfour Buildings, 18 Yuen Nung Yuen Road, Shanghai.) Combined fire extinguishing and fumigating plant.

137. Jan. 2, 1914.—T. W. Ridley, 67 Marton Road, Middlesborough. Apparatus for forming concrete piles.

9,445. April 22, 1913.—W. H. Chadwick and A. E. Macey, 56 Durham Road, Holloway, N. Manufacture of brushes for painting, varnishing, whitewashing, and the like.

17,955. July 29, 1914.—T. W. Twyford, Cliffe Vale Potteries, Hanley, Staffs. Waste fittings for lavatory basins, baths, and the like.

5,618. March 5, 1914.—G. P. Messenger, "Mogador," Layton Road, Hounslow, and D. L. Irwin, 81 Knightrider Street, E.C. Securing flexible roofing in the neighbourhood of skylights or other irregular structures or protuberances upon the roofs of buildings and the like.

15,726. July 1, 1914.—Bilton Evans, Brynderw, Llanyhyther, Carmarthenshire. Foot-operating domestic door opener.

27,581. Dec. 1, 1913.—F. P. Candy, The Homestead, Mulgrave Road, Sutton. Filters.

246. Jan. 5, 1914.—H. M. Macnaughton-Jones, 521 Finchley Road, N.W. Adjustable supports or brackets for lamps, shades, mirrors, or the like.

291. Jan. 5, 1914.—L. S. Rowan, 9 Sandland Street, Bedford Row, W.C., and A. Rowan & Brother, Ltd., 121 Narrow Street, Limehouse, E. Joint for drain-cleansing rods.

473. Jan. 7, 1914.—John Barron, 52 Cow Cross Street, E.C. Traps for general sanitary appliances.

729. Jan. 10, 1914.—Walter Jones, J.P., and Jones & Attwood, Ltd., Titan Works, Amblecote, Stourbridge. Apparatus for purification of sewage or other impure waters.

936. Jan. 13, 1914.—J. E. Foxlee, 11 Colby Road, Upper Norwood, S.E. Fireplaces for dwellings and the like.

1,919. Jan. 24, 1914.—W. B. Young, High Street, Falkirk. Convertible open and closed ranges or grates.

3,944. Feb. 16, 1914.—G. J. Waltho, Union Street, Wolverhampton. Window fastening which secures the sashes in their relative positons both when closed and when partially open for ventilation.

4,794. Feb. 24, 1914.—F. T. Hackman, 5 Western Street, Brighton, and E. J. F. Maflin, 33 Clifton Street, Brighton. Collapsible and portable buildings.

9,653. April 8, 1914.—B. R. Parkinson, 33 Westbury Road, Woodside Park, London, N. Securing the ends of service pipes to gas and water mains.

9,594. April 18, 1914.—A. G. Pemberton, 2 Richelieu Villas, Bagot Road, Bagot, St. Helier, Jersey. Automatic fire or temperature alarms.

13,694. June 5, 1914.—Samuel Ewart, 346 Euston Road, N.W. Gas-coppers.

8,692. April 6, 1914.—A. K. Frantz, Flourtown, Montgomery, Penn., U.S.A. Adjustable level attachments.

8,533. April 4, 1914.—William Oates, Horley Green Works, Horley Green, Halifax. Drain or like pipes.

10,119. April 24, 1914.—E. W. Procter, 1 Britannia Road, Slaithwaite, near Huddersfield. Cooking ranges.

Any of the above specifications may be obtained from J. D. Roots & Co.

THE Roman bath discovered on the site of the L.C.C. fire station in Cannon Street is to be placed in Geffrye's Garden, Shoreditch.

A LOCAL Government Board inquiry into the application by the Corporation of Swansea for powers to construct a main sewer with an outfall in the Bristol Channel at the Mumbles Head at a cost of £350,000, was opened last week and lasted three days.

THE scheme to relieve the congestion of the streets in Sydney, N.S.W., and to provide new facilities for traffic, involves the construction of underground railways, the electrification of the suburban lines, and the building of a large high-level bridge to connect the north and south side of the harbour. The outlay for the whole project, including the erection of a large electric-power station, is estimated at £17,000,000. In order not to obstruct the shipping, which aggregates more than 20,000 vessels annually, the bridge will have to cross in one clear span of 1,600 feet.

"KEYSTONA."

IT will probably be remembered by many of our readers that one of the decorative novelties shown at the 1913 Building Exhibition at Olympia was "Keystona" leadless paint. The term "novelty" must be qualified, however, for the material had for some years been booming in the States and Canada, was known on the Continent, and had already been introduced to the provinces. In North America, for instance, a wall-surface area equivalent to more than 4,000 acres was covered with "Keystona" during 1910. As to its progress in this country during the past two years, one might almost imagine it saying "Veni, vidi, vici," for the list of recent jobs covers a wide range both in degrees of importance and in locality. No doubt it is due to this encouragement that the decision was arrived at to manufacture it in England, or, to be more precise, at Victoria Mills, Hunslet, Leeds. The Keystone Varnish Company now issue no mere vague guarantee, but a very definite and challenging legal contract.

"Keystona" is a washable oil paint without a gloss, which, it is said, combines the merits of water and of oil paint at little more than half the cost of the latter and nearly equal cost to water paint. In actual practice one coat of preparatory liquid is applied, and then one or two coats of "Keystona" are floated on freely like whitewash, the result being claimed as equal to three coats of flatted lead paint.

For use on wet plaster "Keystona" is not recommended, or rather does not carry the full guarantee that any defect which may show within three years after completion will be made good.

VARIETIES.

THE Batley Town Council have been informed that extensive plant ordered twelve months ago for the modernising of the electricity works had been requisitioned by the Admiralty for installation at one of the naval bases.

ST. PANCRAS Borough Council is recommended by its Highways, Sewers, and Public Works Committee not to accept goods of German, Austrian, or Hungarian make, or tenders from firms or persons of those nationalities.

MR. PERCY FITZGERALD, M.A., recently offered to make and present to the London County Council a bronze statue of David Garrick, with a view to such statue being placed in the Victoria Embankment Gardens, near Adelphi Terrace. After careful consideration it was decided to decline the offer. As far back as 1868 Mr. Fitzgerald wrote a biography of Garrick.

AT the Leeds City Council meeting last week a deputation appeared from St. Matthew's Church, Holbeck, to protest against the building of a picture house opposite the church. Quietness for the daily services was urged to be necessary, and it was held that a cinema house would exert a disturbing influence. The minutes approving the house were, however, passed.

THE death is announced of Mr. John James Moffat, the senior partner in the firm of Messrs. James Moffat & Sons, builders, Camp Hill. Mr. Moffat was the eldest son of the late Mr. James Moffat, the founder of the firm, and a magistrate for the city of Birmingham. For a great many years he had charge of the business, and fulfilled many important contracts in Birmingham and the district.

AFTER considering the application by the Glasgow Archæological Society for a further grant towards the expense of erecting a light structure over the site of the Roman camp at Balmuildy Farm, the General Finance Committee of the Glasgow Corporation recommend that £200 be granted out of the surplus from the Scottish Exhibition of National History, &c. (1911), on the condition that H.M. Board of Works make an equivalent grant for the same object, and that the maintenance of the structure be undertaken by one of the Government Departments.

AT the last meeting of the Wrexham District Council a letter was read from the Local Government Board sanctioning the borrowing of £11,000 for the provision of working-class dwellings at Rhos. It was decided to adopt a scheme, prepared by the engineer, for the drainage of a portion of the new garden city now in progress of construction between Wrexham and Gresford. The estimated cost is £3,900.

THE Liverpool Dock Board have adopted a recommendation of the Works Committee to construct a new main sewer across the dock estate immediately to the northward of the Canada Branch Dock No. 3, with an outlet in the Canada Basin, at an estimated cost of £31,600. The work is in connection with the large new sewer the Corporation are constructing in the North End, and under the Liverpool Sanitary Acts the Dock Board have to undertake the portion on their estate.

THE Birmingham City Council in July last approved plans for the extension of the Victoria Courts at an estimated cost of £29,295. Revised plans have now been prepared by Sir Aston Webb, R.A., showing several additions to and improvements on those previously submitted, and involving an increased cost of approximately £12,000, or a total of £41,760. The Watch Committee last week adopted the new scheme, but decided that, owing to the high prices of materials and labour now obtaining, and the possibility of still further increase, the extension should be deferred for the present.

AT the last ordinary meeting of the Royal Institute of the Architects of Ireland a new committee was formed, called the "Ancient Buildings Committee," consisting of Messrs. L. O'Callaghan, W. A. Scott, G. P. Sheridan, P. J. Lynch, and Dr. Cochrane, with the object of keeping records of ancient buildings of architectural or historical interest. The President also announced that the sum of 100 guineas had been subscribed by the Institute and the Architectural Association of Ireland to the special fund inaugurated by the R.I.B.A. to meet cases of distress among architects arising out of the war.

THE death occurred on Tuesday at his residence, Park Place East, Sunderland, of Mr. William Brown Cooper, a well-known builder and contractor. Mr. Cooper, who was fifty-six years of age, was a native of the town, and was a Past-President of the Sunderland Builders' Association. In 1914 he was elected Vice-President of the Northern Counties Federation of Building Trade Employers. He was sole contractor in Sunderland for his Majesty's Office of Works, and had carried out many contracts in Sunderland, and also in Durham county, where he erected numerous schools for the County Council.

THE London County Council in July last accepted the tender of W. E. Blake & Co. for the erection, within a period of twenty-one months, of a new sessions house at Newington. It was subsequently suggested that bonuses should be given for completion within a shorter period, and prices were obtained from the contractors for the completion of the work within alternative periods, the increase over the contract price varying from £2,000 for completion within twenty months to £13,000 for completion within twelve months. In view of the fact that a shortening of the contract period would necessitate the contractors' men working abnormal overtime and of the financial considerations resulting from the war, it has been decided not to entertain the proposal. The Emergency Committee have decided that, in all cases of tenders received before the outbreak of war, when contractors refused to sign their contracts owing to the crisis, they should be allowed the net variation in cost, exclusive of profit, on the whole of the materials used on the works, subject to conditions. Messrs. Blake & Co signed their contract for the erection of the new sessions house on these terms.

TRADE NOTES.

MR. JOSEPH SUMMERSCALES, of Keighley, a director of Messrs. W. Summerscales & Sons, Ltd., washing and wringing machine makers and general engineers, left estate valued at £14,277.

UNDER the direction of Messrs. Thornley Bros., architects, Library Street, Wigan, Boyle's latest patent "air-pump" ventilator has been applied to Christ Church, Martin's Lane, Liscard, Cheshire.

A HITHERTO unsuspected relation to art is about to be claimed for the railway ticket, seeing that the backs of the tickets issued by the Metropolitan Railway are to be illustrated by a variety of designs expressly drawn by Hassall. A new poster, "It's a pity to puncture the Picture," also by Hassall, where the artist manages to insinuate a subtle compliment to himself, will shortly be on view at all Metropolitan Railway stations. The Hassall drawings are to be employed in connection with approved advertisements which the Metropolitan Company have arranged to have printed on the backs of all their tickets. Although the idea of utilising railway tickets for publicity purposes is not absolutely new, the combination of art and advertising in the manner now proposed, and in conjunction with posters, is quite original. It was initiated by Messrs. S. Davis & Co., of 30-31 St. Swithin's Lane, E.C., who have been appointed sole agents for advertising on the tickets of the Metropolitan Railway.

THE RESUSCITATION OF BELGIUM.

THE conference convened by the International Garden Cities and Town Planning Association for consultation as to how the best use may be made of the opportunity presented by Belgium's devastation for a new departure in the resuscitation of the country attracted considerable interest. Naturally, from the source of its inception the thoughts of the conference were directed toward that modern ideal of town planning which we call the garden city. Charming as were many of the old cities and towns of Belgium, they were as far removed as possible from anything like a garden city, and hence the proposal for such a resuscitation involves the most subversive change conceivable.

Necessarily the replanning of Belgian towns on garden-city principles involves immense difficulties, the more so that great landlords are rare exceptions. The towns are divided up amongst numerous freeholders, each as a rule with a very small holding. The land in the towns is densely covered with buildings. How are the innumerable interests of owners to be reconciled? Which of them is to be allowed to rebuild his house and which must consent to see his plot of ground turned into a garden?

Mr. Raymond Unwin did not go too far when he advocated that plans for the rebuilding of Belgian cities should take in nearly the whole of the country, and that in consequence the authorities who ought to take the matter in hand were both the State and the municipal and provincial authorities. The only way, it seems to us, in which it is possible for Belgium to be replanned on garden-city lines is for the State to take possession of the whole country, commandeer it, sequestrate it—call it what you will—and parcel it out amongst its future owners. Here is a fine opportunity for constructive statesmanship. But how formidable the difficulties of compensating the former owners! For it would be unthinkable that they should not be compensated, and not only unthinkable, but impossible, for any such line of action would upset the strongest Government in the world and swamp the land again with blood, poured out in the welter of the most appalling revolution the world has ever seen.

The pious resolutions of the conference are all very well in recommending that plans in harmony with the principles of the Garden Cities and Town Planning Association should be prepared of those towns and villages that have been wholly or partially destroyed in Belgium, and that the distribution of State grants should be made subject to the adoption and execution of those plans. It is easy to make plans on paper. It is quite another matter to finance their execution.

The English methods of garden-city building were very well explained by Mr. Herbert Samuel, President of the Local Government Board, when he welcomed the members of the conference in the name of His Majesty's Government. The Belgian people, with splendid courage, he said, sought to turn to benefit even the disaster which had overwhelmed their country. Belgium had been the victim of an orgy of destruction unparalleled in the history of hundreds of years. Beautiful mediæval buildings which had passed unscathed through the ravages of centuries had now fallen. These, indeed, could not be replaced. Their vacant sites remained as a monument of the shame of Germany. But from the ashes of many of her towns, they might hope to see rise a new and finer Belgium, and her people were already turning from their sorrow and from their righteous anger to look to the future and to the period of reconstruction. Among the refugees, nearly 200,000 in number, whom we were proud to have among us, and who endured with admirable patience the British climate and British customs, there were about 200 architects and surveyors. The happy idea had occurred to some of their sympathisers in this country to bring together these professional men and to place at their disposal our experience in the development of towns on modern lines. The proposal was welcomed by the Belgian authorities, and this conference was the result. He was glad that it had the support of M. Helleputte, the Belgian Minister of Agriculture and Public Works. They were also fortunate in having the presence of representatives of other countries. Those who had suggested the conference were far from supposing that methods which were good for England were necessarily good for Belgium. The towns of different countries had their distinguishing characteristics, and one would be sorry to see them merged in any kind of uniformity, however attractive the model. Yet certain principles if well considered and well founded, might be of universal application. In the middle of the last century there arose a spirit of revolt against the results of the almost unchecked rule of the principle of *laisser faire* which had been dominant in the previous period. The nation had then, as it still had, an intense passion for personal liberty, but at the same time it was found that the complete absence of control might bring disaster. At first it was not the State, but private enterprise that realised the evils that resulted from such a state of things, and sought to remedy them. Certain employers of labour built model towns for their own workpeople; public-spirited men bought up tracts of land and built on them a garden city and a number of garden suburbs adjoining some of our great towns.

Digitized by Google

In the land and houses of the garden cities and garden suburbs no less than three and a half millions sterling was now invested. The existence of these new towns and suburbs was an important object lesson, and at last, in 1909, Parliament passed the Housing and Town Planning Act, the underlying principle of which was to establish public control over the development of cities, but a public control combined with consideration for the interests of landowners and builders. Under its operation a progressive landowner, anxious to develop his estate on the best lines, no longer found that his scheme was spoilt by the careless methods of a less intelligent neighbour. The whole district felt the benefit of the improvement. Already 112 schemes had been adopted or were being prepared by local authorities, covering no less than 180,000 acres, probably not less than one-half of the whole area already built upon in England and Wales. The Act provided that compulsion might be used against landowners who refused to comply with a scheme of a local authority, but so far in not a single case had it been necessary to put those powers in operation.

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.

THE number of drawings we have received for last month has been small, but the quality of them is high.

"Improver" sends measured drawings and perspective sketch of a pulpit in the chapel of Chipchase Castle, Northumberland, an eighteenth-century example with sounding board. Our contributor's rendering is well drawn and adequately detailed.

Mr. B. Fraser's contribution is an oak settle from the museum in Bishop Lloyd's Palace, Watergate Street, Chester. The settle is an interesting example, and Mr. Fraser's drawing is good, though short of details.

We award prizes of one guinea each to "Improver" and Mr. B. Fraser.

NOTES AND COMMENTS.

THE custodians of ancient buildings are often between the devil and the deep sea. For there are various ways of regarding them. This is well illustrated by the various opinions that have been expressed concerning the roof of Westminster Hall. Its present condition is that its stability is so far impaired by decay and ravages of wood-destroying larvæ that it is on the verge of collapse. One set of advocates desire that all the old work still remaining should be preserved, so that we may, as long as possible, look upon the actual handiwork of our forefathers. H.M. Office of Works desire to comply with this very natural sentiment, and from the plans of Mr. F. Baines, M.V.O., propose to relieve the woodwork of the roof from the stress of its work and carry the roof-weight on steel construction. Now come the carping critics, objecting that "the roof will be a steel roof pretending to be of wood—in plain terms, it will be a fraud." This group of critics would apparently desire to substitute an honest steel roof and sweep away all the decayed and damaged timber, or substitute a reproduction in modern oak and modern work of the old. But surely this would also be a fraud! For it would profess to be a mediæval roof and would require close and expert examination to determine the validity of the profession. There are some who urge the argument that the present timbers might be repaired where defective. They have evidently not read the published statement of facts that records the actual condition of the timbers, and in their airily lofty assumption of possibility ignore the feasibility of replacing the interior of a piece of timber of which only an outer shell remains.

In the Upper House of the Convocation of York, the Bishop of Manchester called attention to the report of the Chancellors of the Archbishops, and particularly to the recommendation of the Chancellors that in each diocese and honorary advisory body should be formed to assist in determining the architectural features of any ancient church or building were being properly preserved, the Court not to be bound by the opinion of this body (This House had suggested that a special architect should be appointed.) The Chancellors suggested that this body should not only assist the Chancellor in the question of the varying of the structure of the church, or the restoration of the structure of the church, but consider applications for the sale of chattels. The time would come, said Dr. Knox, when they would have to consider the best treatment of these valuable possessions of some churches. "We should all deprecate the sale of such chattels," added the Bishop. His Lordship suggested that a small committee should be appointed to consider the recommendations of the Committee of Chancellors.

This was seconded by the Bishop of Liverpool.

His Grace the President remarked that one of the most hopeful signs at the beginning of the twentieth century was that possibly more than at any other time the nation had given pious thought to the memorials of antiquity throughout the country. But both in Parliament and in the deliberations of learned societies there had been a very inexact knowledge of the system which the Church had already provided for the care of ancient churches—he referred to the system of Consistory Courts, and of the faculties that must be obtained in these Courts.

The motion was agreed to, and the Archbishop and the Bishops of Manchester and Wakefield were appointed as the Committee, and the President suggested that they should have power to confer with any similar committee of the Convocation of Canterbury.

At a meeting of the Society of Antiquaries an interesting account was given by Mr. F. Lambert, assistant curator to the Guildhall Museum, of recent Roman discoveries in London and the excavations on the site of the G.P.O.

Mr. Lambert began by making some references to the remains of a Roman house found in 1880 on the site of Leadenhall Market. In 1848 walls six, seven, and eleven feet thick, extending east and west, were unearthed near Half Moon Passage, now covered by the avenue of the market along to Gracechurch Street. Again in 1905 the same walls were struck. In 1880 and 1881 the site had been completely uncovered. The principal wall was 12 ft. 7 in. thick, running almost due east and west about 150 ft. long, and apparently running underneath the line of Gracechurch Street.

In 1912 Roman foundations were found on the site of the Mercantile Bank of India, on the western side of Gracechurch Street, 7 ft. wide, descending to a depth of 30 ft. below the pavement. At the northern end of the same street remains pointing to the existence of large Roman public buildings have been discovered.

The first important excavation on the site of the General Post Office was made between 1818 and 1825, when Smirke's building was erected.

In the winter of 1913 Smirke's building was demolished and the soil excavated to a depth of from 22 ft. to 24 ft. The objects found during the contractor's excavation were carefully collected. Three conclusions were come to: (1) The majority of the objects found dated from the first century A.D.; (2) only a very small proportion were later than 150 A.D.; (3) the objects found at the south end were of earlier date than those found at the north.

One of the most interesting relics of Roman London found here was a gold ring, bearing the initials Q.D.D., and an intaglio seal, engraved with an eagle and hare. Another relic was a Jewish coin, struck in Palestine at the time of the second revolt of the Jews (132-135 A.D.).

Further discoveries were the front of a mould for making medallions for pottery and the head of a statue of Venus, and a fragment of a shrine, made of pipeclay from the south of France, of the first century A.D.

HOUSE IN ELM DRIVE, GIDEA PARK.
Mr. T. MILLWOOD WILSON, Licentiate R.I.B.A., Architect.

The money for the investigations was supplied by the Corporation and the Goldsmiths' Company. The Office of Works co-operated, and further work will be done under Mr. Lambert's supervision.

Bones of sheep and pigs were also found, and the skull of a pug. A sheep skull indicated the existence of a breed with four horns.

Interesting remains were also found in Sherborne Lane when the building of the Phœnix Insurance Company was being put up.

In distributing the prizes to students of the Birmingham Municipal School of Art, Mr. Charles Holme, editor of the *Studio*, spoke of the effect of the war on art in response to a request made to him. He put forward the following questions: Would the financial losses be so overwhelming as to destroy for many years to come all prospects of making a living out of the profession of art? Would the interest of the public in art be lessened? Would any drastic changes in the fashion of art be demanded? These were some of the questions which exercised the minds of artists at the present time, and it was most difficult to give a definite answer to any of them. They would have to bear themselves in patience for many months before prospects were clearly defined. But in these days of marking-time they might assure themselves that the great subject of art would outlast all present storms and troubles. Art in some of its phases was essential to civilisation; it was the outcome of the subtler senses of man; and its expression not only required the trained eye and hand, but also the front functions of the brain as well. It was a form of language of such a nature that no dictionary ever compiled contained all the words to express what it could impart. Without a knowledge of and a strong feeling for art they must fail to appreciate many of the manifestations of nature. Referring to art teaching in relation to the crafts, Mr. Holme said there was a tendency among some people to criticise unfavourably the productions in wood-carving, metal work, pottery, and other forms of decorative art as exhibited in the schools. The error made by such critics was in suggesting that the work so produced should be of a very much higher quality. They did not find the critics commenting unfavourably on the oil and water-colour paintings and other forms of the graphic arts because these did not reach the level of the old masters. Why then should they imagine that examples of art craftsmanship done in the schools should be of surpassing excellence? In conclusion, Mr. Holme, dealing with the memory system of drawing, which, he said, Mr. Catterson Smith had so wisely adopted in the Birmingham School of Art, said he believed that system would have good results in the future, and they would do well to give support to their director.

At the last monthly meeting of the Society of Antiquaries of Scotland, Mr. J. Graham Callander, secretary, described a small cup of cast bronze found in

Digitized by Google

a sandpit some years ago near Tarland, Aberdeenshire. This object, which appears to be unique, measures 2½ inches in external diameter at the mouth, and has a height of 1⅝ inch. It is gracefully designed, and ornamented round the neck with a transverse row of small studs less than ⅛ inch apart, finished with sharp conical heads having a projection of about ⅛ of an inch, and with groups of vertical rows of similar studs extending upwards to the lip. As the cup was cast, these studs were purely ornamental, but in style this small vessel presents a resemblance to certain large cauldrons formed of plates of bronze, in which similar studs are used both structurally and for ornament, preserved in the National Collection. With the cup were found a number of small glass discs, such as are not uncommon on Roman sites, and are believed to have been used as counters or playing-men. A single human tooth found also seems to point to the deposit having been sepulchral. The evidence appears to place the find in the first or second century of our era.

One good result of the Civic Exhibition held in Dublin last year was the formation of the Civic Brightening-Up Guild (in affiliation with the Civics Institute). The main object of the Guild is to assist in beautifying the city by transforming derelict spaces into children's playgrounds and school gardens, and in the various rooms of the building were displayed numerous pictures, illustrative of the campaign for the fighting and prevention of disease and the perils that assail child life amongst the working classes. In addition to the establishment of babies' and mothers' clubs, girls' clubs, boys' camps and clubs, social centres, men's clubs, and recreation rooms, it is the purpose of the Guild to provide during the war accommodation for social clubs for soldiers' and sailors' wives and mothers and other relatives.

The Guild was established at the time of the Civic Exhibition. The Guild set to work and commenced by dealing with the streets adjoining the Civic Exhibition. The owners of property were asked to paint and decorate their houses, and the occupiers were asked if they would accept gifts of window-boxes filled with flowers. The Corporation and the Tramway Company were asked to assist in brightening the streets, and the response made to these appeals was magnificent. Her Excellency Lady Aberdeen presented the Guild with 400 window-boxes, filled with growing plants, and not only the members of the Guild, but the public, should feel deeply indebted to their Excellencies for the interest they continued to show in the welfare of the people.

The assessment of sewers for income-tax has excited considerable opposition in some of the Scottish burghs on the ground that this being paid through the local rates, of which of course it forms only a small fraction, falls upon persons who under the general rules of income-tax assessment should be exempt. There is also the inequality that hardly any boroughs in England have been asked to pay income-tax, and that even in Scotland burghs were not on the same footing.

War-time has developed various ingenious schemes on the part of our financial authorities, but it has been reserved for a Lincoln magistrate, who holds strong views on Socialism, to propose that the Corporation of Lincoln city should seek power from Parliament to issue paper notes in order to pay for a new school. This is, however, but a revival of the old custom of tokens, which were issued by towns and even by tradesmen in the past. There is but a question of degree between a copper token and a paper note. Both are equally an acknowledgment of liability to pay in sterling coin, and depend for their acceptability upon the credit of the issuing party.

WAR ITEMS.

In connection with the campaign undertaken by the Board of Trade on the advice of their Advisory Committee on Commercial Intelligence to assist British manufacturers and merchants to secure trade formerly in the hands of German or Austro-Hungarian firms, the Board continue to receive a very large number of enquiries for the names of sellers or buyers of articles of which sources of supply or markets have been interfered with by the war.

Special arrangements have been made in the Commercial Intelligence Branch of the Board of Trade for dealing with these enquiries, and lists are prepared and circulated of articles which enquirers desire (a) to purchase and (b) to sell. List 8a is now ready and may be obtained by United Kingdom manufacturers and traders.

British firms interested in any of the goods mentioned, either as buyers or sellers, should communicate with the Director of the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C.

THE LATE F. R. E. SLADDIN.

MR. F. R. E. SLADDIN, a well-known and respected Cape Town architect, died at the Mowbray and Rondebosch Cottage Hospital on Sunday, January 10, after having undergone an operation for appendicitis, at the early age of thirty-four. The late Mr. Robert Sladdin was a Fellow of the Surveyors' Institute of London, a Licentiate of the Royal Institute of British Architects, and a Fellow of the Cape Institute of Architects, and a member of the Council of the latter body. Articled in 1898 to Messrs. Young & Brown, surveyors, of London, Mr. Sladdin went out to Cape Town in 1905, where he joined his brother, Mr. T. A. Sladdin, F.R.I.B.A., and practised with him until 1910 as Milne & Sladdin. Since 1910 the deceased gentleman had been sole partner.

A man of many attractive social qualities and gifts, the late Mr. Sladdin was very popular and will be much missed. He was an active member of many clubs and societies and an indefatigable worker and organiser of entertainments for charitable and other beneficent objects. He was also a good sportsman and a ready public speaker. He has left a widow and child at present in England. "His sun has gone down while it was yet day."

The funeral took place at Maitland on the day following death. The Rev. C. Brook, Rector of Rondebosch, officiated, and there was a large gathering of mourners. Among the many beautiful wreaths were tributes from the Cape Institute of Architects, the Melodic Club, the Owl Club, the Olympic Sports Club, and Mr. Justice Maasdorf.

SHEFFIELD SOCIETY OF ARCHITECTS.

BEFORE the Sheffield Society of Architects and Surveyors Mr. W. S. Purchon, A.R.I.B.A., lectured last week on "Architecture and Environment." Mr. Purchon, in his effort to stimulate interest in a new "atmosphere" in architecture as indicated in the subject of his lecture, referred to the great architectural glories of Rome, Greece, and Egypt, thence passing on to the Romanesque and Gothic eras in Western Europe, and to the spread of the Renaissance in England and France. He explained that he wished the character of the work of past ages to be extended to-day and that his remarks had been influenced by a desire for education. No architect was ever called upon to prepare a building which possessed no environment, and he sought to blend the environment with the building, so that a harmonious whole might result.

COMPETITION NEWS.

NEWCASTLE-ON-TYNE.—At the last meeting of the Education Committee the Rutherford College Committee recommended that the design of "No Steps" be approved for an assembly hall at Rutherford College Girls' School, if the plans could be slightly amended. The contract is for £4,000, and the design of "No Steps" was from Messrs. Marshall & Tweedy.

MR. JOHN ALFRED ARNESBY BROWN, A.R.A., and Mr. Joseph Farquharson, A.R.A., were last week elected Royal Academicians.

ILLUSTRATIONS.

BUSINESS PREMISES, LONDON ROAD, NORBURY.

THIS building is designed to meet the needs of a trading company requiring ample show-room space, with workshops in the rear on the ground floor, a lecture-room for occasional demonstrations on the first floor, and on the top floor residential accommodation for the local manager.

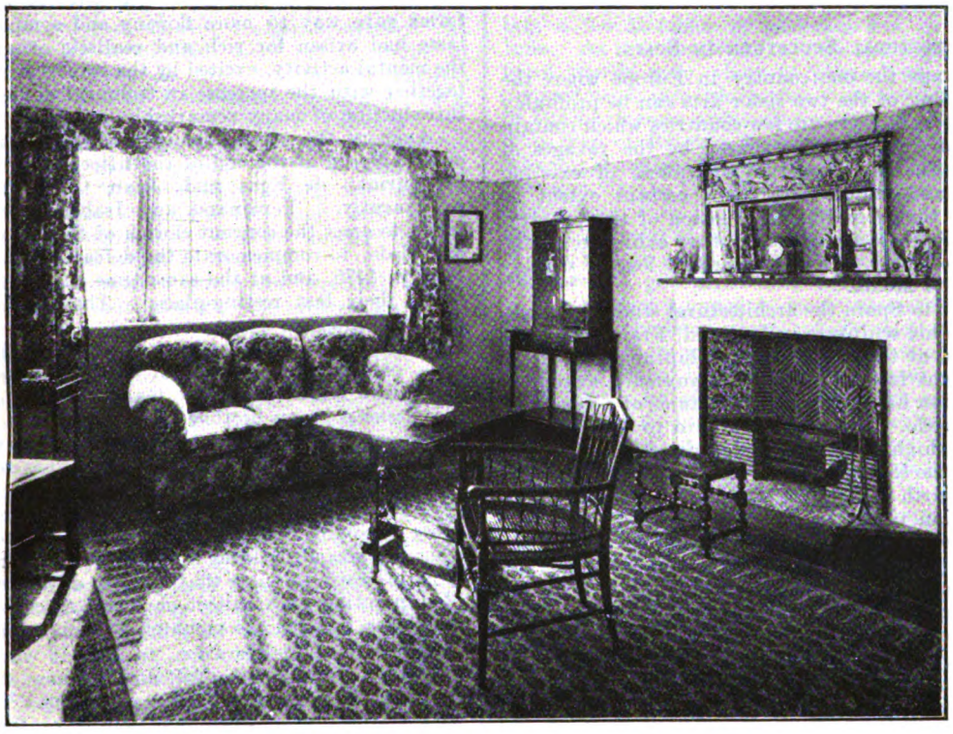
The materials to be silver-grey stocks, with stone dressings and hand-made roofing tiles. Window displays being a secondary consideration in this case, it was decided that large areas of plateglass would be unnecessary. It was, therefore, possible to add scale to the design by the use of glazing bars without diminishing the commercial value of the premises.

The architects are Messrs. Topley & Baxter, AA.R.I.B.A.

"MILL HILL," 14 AND 15 WINTERSTOKE GARDENS.

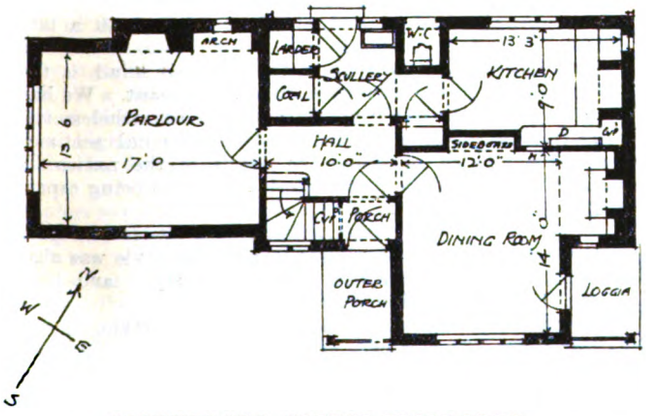
THESE houses are the last pair of a group of sixteen, built during 1910-12, with a frontage to Hammers Lane and abutting on the grounds of Mill Hill School. In front of the houses, which are symmetrically grouped on either side of the entrance to the school property, is a common garden, of an average width of 50 feet, in which the five existing trees have been left standing. The builders were Messrs. Wm. Moss & Sons, Ltd., of London and Loughborough, and Mr. M. S. Briggs, A.R.I.B.A., was the architect.

"CLAREMONT," GIDEA PARK.



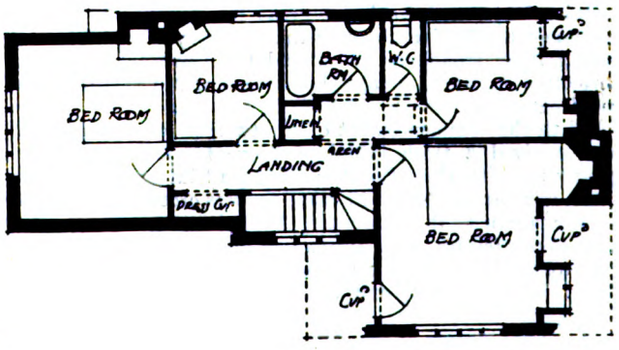
THIS house is planned to suit the aspect, the dining-room facing south-east, the drawing-room south-west, the hall south, and the kitchen and larder north. The walls are of keyed Fletton bricks, plastered inside and out, with hand-made stock bricks for plinths and chimney caps. The builders were Messrs. W. Moss & Sons, and the architect Mr. A. Randall Wells.

"DIE LORELEI," GIDEA PARK.



THIS house has an open wooden entrance porch with seat. The dining-room has a large curved bay window, and the drawing-room a bay with seat, looking on, and leading into, the garden. Up to the first-floor level the walls are built hollow and faced with cherry-red bricks. Above the first-floor level the walls are covered with rough cast, distempered cream. The tiles are red-brown Broseley tiles; the windows are all leaded lights in wood casements. The builders were Messrs. W. Moss & Sons, and the architects Messrs. K. D. Young, F.R.I.B.A., and H. Hall, F.R.I.B.A.

"SOUTHEASE," GIDEA PARK.



THIS house has been planned so as to obtain all the sunlight possible, as may be seen from the plans. Externally the house is built with hollow walls of hard stock bricks, distempered cream colour, with hand-made silver-grey tiles for the roof, and the windows have leaded lights and iron casements. The chimney stacks are of local red hand-made bricks 2 inches thick. The builders were Messrs. W. Moss & Sons, and the architect Mr. T. Millwood Wilson, Licentiate R.I.B.A.

PARLOUR, "SOUTHEASE," GIDEA PARK.

"SOUTHEASE."—GROUND FLOOR PLAN.

"SOUTHEASE."—FIRST FLOOR PLAN.

WESTMINSTER ABBEY, NORTH TRANSEPT.

THIS drawing was made by Mr. Chas. S. Carter, as part of his work as "The Architect" Travelling Student for 1914.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A GENERAL meeting of the Royal Institute was held at Conduit Street on Monday, February 15. Mr. Ernest Newton, A.R.A., President, occupied the chair.

The decease was announced of the following members:—Henry Dawson, elected Associate 1859, Fellow 1869; George Herbert Burstow, Associate, elected 1910; John James Smith, Associate, elected 1882; Frederick Robert Edwin Sladdin, Licentiate, 1912.

PRESENTATION OF PRIZES.

Mr. Ernest Newton said the meeting would remember that owing to the war the annual competitions for the prizes and studentships in the gift of the Institute had been postponed. He had, however, the pleasure to make two presentations that evening—one, the Ashpitel prize, to Mr. G. E. Francis, who has distinguished himself most highly in the final examinations of the year, and the other, the Pugin medal, to Mr. William Cecil Young, who was awarded the studentship last year and, having fulfilled the conditions to the satisfaction of the Council, is now entitled to receive the medal.

The Ashpitel prize and the Pugin medal having been presented, Mr. And. N. Prentice, F.R.I.B.A., then read a paper entitled

ARCHITECTURAL SCULPTURE IN SPAIN.

Spain is perhaps the one country in Europe where the happy intermingling of the two sister arts can be profitably studied. At all events, there are few countries which contain such a wealth of fine examples spared by the ravages of time and war. The well-preserved sharpness of existing works in stone and marble may to a certain extent be accounted for by the geographical situation of the country, while the profusion of decorative sculpture exhibited on the buildings may be traced to a characteristic love of display inherited from the Moors.

On a first visit to Spain the architectural student already familiar with Gothic sculpture in England, France, or Italy will be astonished at the richness and voluptuousness of the work when brought face to face with many such examples. No Spanish sculptor has ever risen to the fame of a Donatello or a Michael Angelo. Nevertheless, Spain produced native talent of a very high order, quite unsurpassed by any in England during the same period.

To trace the birth of Spanish sculpture we must go back to Early Christian times, to a period long after the Visi-Goths had gained a footing in the peninsula. It would appear that the Visi-Goths mainly expended their energies in fortifying their towns and in converting the Roman buildings to Christian uses. On the conquest of Spain by the Moors in the year A.D. 711 the vanquished Goths retired into the mountain ranges of the Asturias, where they were able to establish themselves and to form a stronghold, from which their champion Pelayo in later years issued forth, and started the movement for the reconquest of Spain to Christendom.

Scattered along the coast to the north-west of Spain are remains of churches of the eleventh century, containing portals, fonts, and tombs of great interest if not of very great merit. Native Spanish art was very slow to develop during these troublous times, and the Christian monarchs were often driven to engage the services of Moorish sculptors and decorators.

With the commencement of the twelfth century architecture received a fresh impulse. More frequent intercourse sprang up with the adjoining northern States. Royal marriages were arranged, and French princes crossed the frontier to war against the Moors. Accompanying them came numerous prelates, and afterwards followed architects and sculptors. The influence of the great ecclesiastical order of Cluny was soon felt, and the Romanesque style gradually developed.

The imagination of the Romanesque stone-cutters lavishly displayed on monuments and in churches may be admired on the double capitals in the cloisters of Santo Domingo de Silos. They are all richly carved with Bible subjects, with beast forms, fantastic monsters, and familiar scenes from human life.

With few exceptions the new churches were of moderate size. Their type was that of the basilica, with well-marked transepts, and occasionally at the crossing a lantern dome was added. At Toro, Zamona, and Salamanca this form of dome was further developed. It seems to have been a feature on which the Spaniards exercised their ingenuity in evolving a type peculiarly their own. The Romanesque style lasted longer in Spain than anywhere else, and continued till as late as the fourteenth century.

In France the tremendous activity of the thirteenth century architects soon made an impression on Spanish architecture. As a result the cathedrals of Leon, Toledo, and Burgos came into existence modelled on buildings such as Amiens and Rheims. The creative activity of the sculptors, stimulated by studies from life, produced work which deserves to rank with the best French examples, as, for instance, the figures on the portals of Leon, Burgos, and Tarragona cathedrals.

The sculptures at Burgos Cathedral are alone sufficient to indicate the proficiency of the stone-carver's art; those in the cloisters bear traces of colour. Fortunately, up to the present, they have not suffered from restoration. The colours are faded, but the vivid reds and blues, so much used by the Moorish decorators, can be easily seen, together with traces of gilding.

Up to this time Spain was content to retain the services of French sculptors as her teachers and advisers. In the last third of the fifteenth century, however, Flemish carvers were induced to visit Spain, and brought about a transformation of the art.

In architecture the geometric severity of early Gothic forms gave way to more flowing and sympathetic lines, a taste had arisen for rich and realistic ornamentation, and the mental activity, excited by the importation of new styles, together with the increase in technical dexterity, led to the introduction of many remarkable buildings.

Amongst the many Flemish architects who were brought over to Spain at the end of the fifteenth century, the names of Enrique de Egas and Juan Guas stand out most prominently. Ferdinand and Isabella commissioned the latter to erect the convent church of San Juan de los Reyes, at Toledo, to commemorate the defeat of the Portuguese at Zoro in 1476, and at the same time they meant this church to be their last resting-place. The building has a very beautiful interior.

Cardinal Mendoza, who was primate of Spain at this time, obtained the services of the architect Juan Guas to design the family palace at Guadalajara. Juan Guas was also assisted by his brother Enrique, and the latter no doubt is responsible for the fantastic design of the patio. It must be admitted that this kind of treatment is very appropriate to a southern climate.

With the advent of the sixteenth century native architects arose in Spain, notably the Hontañons, father and son, and when the idea of building a new cathedral at Salamanca arose it is interesting to note that in those days the vexed question of appointing an architect gave rise to considerable discussion, even between the monarch and his subjects.

After much deliberation, in 1512 it was decided not to pull down the old cathedral, and the new structure rapidly arose on a site immediately adjoining. The west front, with its profuse adornment of sculpture, was the first portion of the fabric to be erected, developing later lofty arches, slightly reminiscent of Peterborough. The centre arch is enriched from top to bottom with fine medallions, delicate ornamentation, and statues, executed at a later date.

The impression conveyed to the English mind is that the whole thing is overwrought and extravagant. We have nothing like it in our own country, but nevertheless it is a faithful expression in stone of the national sentiment for display which pervaded the minds of the nation. It would, indeed, be difficult to conceive the style being capable of further development.

Some twenty years later, after the erection of Segovia Cathedral by the same architect, the Gothic style was abandoned in favour of the new Plateresque style, and forms of the Early Italian Renaissance.

During this transition the "Mudejar" style, as it is called, came into existence.

On the discovery of the New World architecture developed a strong Renaissance feeling. A new style gradually came into being. It was called the Plateresque. The name seems to have been conveyed from the notion that its surface ornamentation and arabesques resemble the carefully chiselled work of the silversmiths. Spanish sculptors who had studied in the studios at Rome took part in the movement, and vied with the late Gothic sculptors in decorating buildings with a new garb. The old Gothic constructive principles still remained, the new birth being simply a change into Classic detail of Gothic ornament.

The sculptor Philip Vigarni or Borgoña was one of the

Digitized by Google

first to come under the influence of the Plateresque. We find him in the capacity of architect undertaking the rebuilding of the lantern dome of Burgos Cathedral, a marvel of rich Renaissance detail cleverly mixed with the Gothic.

To the student of the Plateresque the buildings of Salamanca would perhaps most strongly appeal. It was in that city that Diego de Deza, Archbishop of Seville, added the fine Plateresque façade to the church of San Esteban, commonly called Santo Domingo.

The finest and most perfectly preserved carvings in Spain are undoubtedly to be found in the interiors of the great cathedrals. The subject of sepulchral monuments in Spain could alone fill a large volume. Their number is infinite, and to anyone conversant with Spanish history the greatest pleasure and interest are afforded by their examination. They present to the mind, with the greatest vitality and distinctness, men who have taken an active part in the national affairs of Spain.

There are some really fine monuments in the cathedrals of Salamanca and Burgos. Many of them are richly painted. The predominating tints are red, dark blue, and white; there are also traces of yellow, possibly due to the sizing used in fixing the gilding.

In the kingdom of Aragon, which borders on the Mediterranean, intercourse with Italy was frequent, and we find works of Spanish sculptors showing Italian sympathy. At Sequenza there is an admirable tomb of a knight of Santiago, Martin Vasquez de Arco, one of the earliest monuments to show Italian Renaissance influence. It is attributed to Damian Forment, a native of Valencia.

At this period Spain had the proud honour of producing a sculptor of its own, in the person of Gil de Siloe. He was a native of Burgos, a city already famous for its many fine productions of the sculptor's art, and, born in an atmosphere of deep inspiration, it is no wonder that he soon became the greatest artist of his day.

With the early Renaissance movement, especially in the south, a whole series of monuments of the greatest historical interest came into being, in which all the forms and motives of this style are represented: medallion reliefs, statuettes, garlands of fruit, winged lions, and other animals. The Florentine sculptor, Domenico Fancelli, came over to execute the monument erected to the Catholic Kings of Granada. The Spanish sculptor, Bartolome Ordoñez, without doubt collaborated with Fancelli, for it is known that he went over to Carrara from his native town of Barcelona to execute the memorial to Cardinal Ximenes. Fancelli having died in 1520, Ordoñez was chosen to complete the work. There seems, also, to be no doubt that Ordoñez was the author of the tombs of Juana la Loca and her husband, Philip I., placed somewhat later at the side of the monument of her father and mother in the Royal Chapel of Granada.

Much praise has been lavished on these famous monuments. Their creation caused great excitement amongst artists of all nations, and when the scheme was first promoted foreign sculptors hurried to Granada. It is stated by some writers that a competition was instituted and that the famous Italian sculptor, Torregiano, who designed the tomb of Henry VII. in Westminster Abbey, was one of the unsuccessful competitors. Torregiano afterwards carried out many statues in Seville, where he ultimately settled and died of a broken heart. Nevertheless, it must not be claimed that the figure sculptors of the Renaissance were on a higher plane than their immediate predecessors; neither in expression nor character, nor in observation of nature, nor in gift of story-telling were the Renaissance sculptors superior to their brethren of the late Gothic period which we have just been discussing.

It was not long before Spain found a great exponent of the new art. The influence of Michael Angelo soon had an effect on the Spanish temperament. His work appealed to their feeling for the serious, the dignified and the deeply emotional. The name of Alonso Berruguete is identified more than any other with this whole period, especially with the grotesque style. He was born in the year 1480, and was the son of the King's painter. On arriving in Italy he entered the studio of Michael Angelo, where he was entrusted with the copying of the Pisan Cartoon. On his return to Spain in 1520 Charles V. appointed him to be royal sculptor and painter. His carvings in wood and stone are to be found throughout the country. Some of his principal works in wood are the carvings on the Gospel-side of the choir stalls in Toledo Cathedral.

The most remarkable features of a Spanish cathedral were the altar-pieces or Retablos Mayors, as they were called. From a very early date the choir of a Spanish cathedral became located in the centre of the building immediately to the west of the transept crossing, and it usually occupied about three bays of the nave. Facing it, on the east side of the crossing, was the Capilla Real, placed in that part of the building which formed the choir in an English cathedral. The spaces occupied by the choir and the Capilla Real were enclosed on three sides by lofty stone screens.

It seems, therefore, fitting that the large expanse of blank wall, on the outside of the choir, called the Trascoro, should be utilised for the display of sculpture. The peculiar position of the choir was owing to the admission of the laity to the transept in front of the altar.

The back of the Capilla Real in the cathedrals, called the Trassagrario, was often richly decorated. In Burgos Cathedral it was completely covered with sculpture.

The altar-pieces of Spain are the distinguished expression of the country's art, and their construction gave endless employment to the architect, the sculptor, and the painter. In no other country have their works developed and assumed such huge proportions. At first we find them as screens, dating back to the twelfth century, when small portable altars or diptyches were used by generals to pray in front of before going into battle. The Romanesque churches contain a few Retablos of moderate size, designed on simple lines. As they developed in scale and importance, the sculptured panels gave place to painted ones, and the many compartments into which they were divided became enclosed in Gothic frames and traceries richly painted and gilded. This type of Retablo, however, had a short existence; the inherent Spanish feeling for the realistic, strongly countenanced by the Church, revived the old tradition of combining both arts. The sculptured panels appeared again, and at the end of the fifteenth century, when the vitality of Spain was at its highest, the carvings were entirely coloured and gilt.

The method adopted is most interesting. Different sets of artists completed these polychromes. First, and most important, there was the tracer—the chief artist—who furnished the design both for the whole work and its ornaments of statuary; he also superintended its execution, and was the architect *de facto*. To him the sculptors, ornamenters, master masons, and master carpenters were subordinate, but the painters, damaskers, and gilders were free from his control.

With the advancement of time huge Retablos rapidly arose, soaring up to prodigious heights. All that had been expressed in earlier examples, by painted groups on panels, was translated into sculpture. The general impression conveyed to the mind, on observing these Retablos, is less pleasing, and the eye is fatigued on attempting an examination of their detail.

In Mr. Prentice's opinion the most successful of these huge works is the Retablo at Toledo Cathedral, in the Capilla Real, designed by Philip de Borgoña. The composition presents a playful variety of forms, combined with a vigour of detail that is very satisfying. It may be noticed that there is a certain variety in the spacing of the compartment, and that the whole work bears distinctly the impress of no ordinary designer. The character of the draperies alone would suggest a northern artist. Each Spanish town had a type of Retablo peculiar to itself.

Wood-carving as a favourite art remained in Spain for several centuries, after the Spaniards learned to excel, under the skilled tutelage of the great masters from Germany and Flanders. The art of carving became highly honoured. An early ordinance of Seville referring to wood-carving, masonry, and building esteems it "a noble art and self-contained, that increaseth the nobleness of the King and his Kingdom, that pacifieth the people, and spreadeth love among mankind conducting to much good."

The silversmith's art attained a place of equal importance.

In conclusion: after an examination of these magnificent works, it seems sad to realise that the glory of Spain has departed.

Whether we wander through the deserted cities of Castille or make a pilgrimage to some remote cathedral, it is manifest that in matters of art this once powerful empire has never ceased to exist, but still continues to rouse our wonder and admiration. Amidst crumbling decay still stand the monuments of Spain's greatness. If nowhere else in the world such glorious works of art are to be found amidst such poverty, let us hope for a speedy revival in Spain of those factors which will raise it once more to its former

Digitized by Google

position amongst the nations and cause it to take its place amongst the highest artistic circles of the world.

DISCUSSION.

Mr. W. R. Colton, A.R.A., said it was very easy for him to propose a vote of most sincere thanks to Mr. Prentice for his very charming and carefully thought out lecture. But he was afraid that beyond the performance of that appointed task there was an idea that the proposer should, as it were, rather drastically criticise the performance in detail. He was afraid he had not had the time to criticise the delightful lecture since receiving it. Moreover, he had always been profoundly ignorant of Spanish sculpture. Speaking from the sculptor's point of view, he felt that most of what he had seen on the screen suggested gilding the lily and a crowding up of detail to such excess as to make the whole ineffective. And beyond that the architect, or the master tracer, as Mr. Prentice told them he was called, had the sculptor under his direction, for the painter was free and was guilty, after making this excess, of colouring it vividly and finally gilding it. The effect may be barbaric, but one regrets there was not more reticence, better arrangement of spaces and decoration. But it is reported that one of the most distinguished sculptors of the present day obtained his inspiration from studying Spanish sculpture. That may be true, for it was not so much in the sculpture itself where the objection lies, but to the crowding-up and the too small detail. The Spaniards were evidently very much like what we are to-day with their artistic quarrels and differences of opinion.

Professor Gerald Moira said he felt that in the old Spanish times painters came a bit by their own. To-day sculptors are having everything their own way; but in those days the painters were allowed to have a whack at sculptors and paint over all their things. That must have been a great pleasure. There could be no doubt the feeling one has in seeing all these things is that there is a terrible overcrowding. But it was chiefly due to a desire to make an original artistic production.

Mr. A. T. Bolton said it was over twenty years ago since he had followed Mr. Prentice's footsteps in Spain. He did not think Spain was the place for a young architect to go to at the commencement of his studies. But it was a country where one sees things which are extraordinarily satisfying after one has seen the others. The conclusion one comes to is that painting is the big art in Spain. The Romanesque is the finest architecture there, and examples at Orvieto and Leon are extraordinarily interesting. It shows what a wonderful period the Romanesque was, and how they were on the verge of great works. The upper part of Leon Cathedral had been carried out at the time of the Renaissance; but when he was there it was being replaced by Romanesque stonework—a good deal of that sort of thing was done in Spain. Salamanca was the Oxford of Spain: the central tower of its cathedral inspired Richardson for one of his New York churches. The reredoses were one of the most characteristic things in Spain. When one enters a dark cathedral and sees at the end an enormous object which is represented by the reredos entirely gilded, it becomes as a piece of metal and cannot be judged either as stonework or as colour. Their intense craving for realism in sculpture must be understood if Spanish art is to be understood, whether architecture, literature, or painting. The whole country is rich, but it was necessary to study it beforehand. There are none of those delightful casual things to be met with in Spain which one finds in other countries. In Spain one goes from one town to another, and except for an occasional big castle the country between is a desert.

Mr. J. D. Crace could not help regretting that a word had not been put in for the painters. The reredoses are not strictly shown as sculpture; they are the decorative focus of a church. Coloured sculpture was almost a speciality of Spanish work. The very remarkable carved figures in wood, and painted, might be emphasised both for their vigour and their execution. He believed there were a few of the figures in South Kensington. When in Spain he had been very much struck by the overcrowding not only as regards the reredoses, but also on the exterior. He did not think the architecture gained as it might have done if the sculpture had been more restricted and recognised better the intention of the architect. Yet it was extraordinarily effective and bold, especially the heraldry, of which Spain was the place to study. The execution of the sculpture never attained to the fineness of the French work. There was none of the loving care which the French or the Italian lavished. He agreed with Mr. Bolton that Spain was not the place for the young student.

Mr. Ernest Newton (President), in putting the vote of thanks, regretted he had never visited Spain, for photographs only gave a very general idea. One has to imagine such things as the sunlight and the local colour. Mr. Prentice had first introduced them to Spanish architecture when he published his sketches of Spain some years ago. They had been told that our students should not go to Spain, but the British architect possessed a great power of assimilation and a very sturdy digestion, so that even if, after the war, they did go there, he felt sure British work would always retain distinctly British characteristics.

A vote of thanks was then passed with acclamation.

Mr. Prentice having acknowledged the vote, the meeting terminated.

The next meeting will be held on Monday, March 1, when the election of the Royal Gold Medallist for the current year will take place and will be followed by an election of members and other business.

ROYAL ACADEMY LECTURES: ARCHITECTURE.—I.

THE course of four lectures on "Architecture" to be delivered this year at the Royal Academy by Professor Edward S. Prior, M.A., A.R.A., Slade Professor of Fine Art in the University of Cambridge, was commenced on Monday afternoon last, February 15. The second lecture was given on Wednesday, and the third and fourth will be given on February 22 and 24. The general title of the course is "The Thousand Years of the Flemish Arts," and the particular title of the one here reported is

I.—THE ROMANESQUE AND GOTHIC ARTS OF THE LOW COUNTRIES.

To Britons the artistic treasures of the Flemish cities have, said Professor Prior, made them a holiday ground for centuries of our artists, and apart from the attention now focussed on them, there has always been for English students a special value in the Flemish story of the arts, because we recognise it as bearing on the English story. We note from time to time special influences which have linked English architecture, sculpture, and painting with those of the Low Countries. In art as in commerce there has been, as Seeley said, a *magnus intercursus* between England and the Low Countries—a great running to and fro. Artists and craftsmen have passed from the Thames to the Scheldt, and from the Scheldt to the Thames, in a practically uninterrupted stream since Charlemagne sent to York for Alcuin as director of his educational bureau. The Low Countries' commerce has been the conduit by which, as it were, two separate streams of artistic influence have flowed into English art. A rough generalisation distinguishes these two streams as Teutonic and Romance.

In the story of European art the Flemish individuality (which we may justly call the Belgian quality) counts as forming and captaining for many generations the art movement of Northern Europe. It made, we may say, the Northern Renaissance. It was the purpose of the present lecture to explain how the circumstances of the Low Countries and the conditions of the peoples, the changing of political connections, materially contributed to a certain special quality of Flemish art, and as a consequence to the trend of the North European production of art.

In a broad sense there were three distinct periods in which the influence of the Low Country art was dominant.

First were the centuries of the early monastic civilisation of Western Europe, its culminating date about the year 1100, but with its power scarcely diminished for another century.

Secondly, after that thirteenth century there grew up, following an interlude of English supremacy, the Flemish Gothic era, that of the fifteenth century, which, under Burgundian patronage, expressed itself in sculpture, in painting, and commercially in the luxuriant arts and crafts of Bruges, Ghent, and Brussels. The culmination of this second era as regards the Low Countries may be placed c. 1500 and the sixty years following.

The wars of religion coincided throughout most of Europe with a crisis in the succession of the arts. After the middle of the sixteenth century the Dutch Netherlands separated from the Flemish and advanced to an art of their

Digitized by Google

own. On the other hand, the Netherlands attached to Spain achieved another period of artistic supremacy.

It was the early monastic art of the Germanic civilisation, with Aix-la-Chapelle as its centre, that in the eleventh and twelfth centuries found expression in the Ardennes' slopes, dying down into the sandy plains of Brabant and Flanders. Then, after 1150, civilisation came the other way; the French Gothic influence was centred in Paris, and in the thirteenth century the architecture of the Ile de France was the controlling influence in the country of Flanders, in Hainault, and Brabant as much as in Picardy—for at this date Holland had hardly emerged from the sea. But when in the fourteenth century the sun of Paris was behind a cloud, then for 200 years the great towns of Flanders, Ypres, Bruges, and Ghent were the centres of European trade, to which after 1383 the Lordship of Burgundy gave political importance. The art of the Low Countries supplied all Northern Europe, and gave to the Northern Renaissance a quality that held for 300 years, till its supremacy was displaced by the French era of Louis Quatorze in the seventeenth century.

Their artistic supremacy thus had two phases—first, the Flemish Gothic phase, and secondly the Flemish Renaissance phase. These two phases had this in common—that in either case they were exhibited chiefly in religious furniture—in either case the artistic effort was at the service of religion. It was in the medium of this Northern Catholic Renaissance that the Flemish school of painting, that of Rubens, established itself. From 1550 to 1650 Antwerp was the most important city of Europe.

If the epithets monastic, commercial, and pictorial are affixed to these three phases respectively they will represent roughly the agencies by which the several diffusions of Flemish style came about.

In his opening lecture Professor Prior described the first centuries in which the art of the Low Countries developed the peculiar quality of chaftsmanship that was to make its especial character.

As already mentioned, Aix-la-Chapelle, or Aachen, was the centre of the Low Country civilisation in the eighth and ninth centuries. Charlemagne's chapel there, itself modelled on San Vitale at Ravenna, was the start from which monastic building of West Europe entered on its notable career, culminating in the final triumphs of the Gothic cathedral. It was the accepted model, and we constantly read that such and such a church was planned to resemble it. The great example of Flemish Romanesque is the cathedral at Tournai; and this used the Aix-la-Chapelle not only for the east end, as did the Mid-French churches, but for the transeptal wings. Following Tournai, other churches of Flanders, such as Cambrai and Valenciennes, had this same planning of great apsidal transepts. The influence of their planning spread into the French domain of architecture, where the cathedrals of Noyon and Soissons have these apsed transepts. And remember it was in Noyon and Soissons the first inventive advance of the French Gothic was made.

Flemish style was therefore in its twelfth-century development an important province of the Romanesque development which was to produce Gothic. The transeptal towers of Tournai had in England their cognates in our cathedral of Canterbury, as this was enlarged under Prior Ernulph in 1090, the point being that such towers attached to transepts are not of Norman design, but come to us from the great district of Cologne architecture which Tournai represents.

Tournai was distinguished in the eleventh and twelfth centuries not only in its wide building influences, but also for its sculpture of marble and for its bronze work. For centuries its schools of sculpture and metal-work headed the arts of the Low Countries, issuing from Charlemagne's crafts school. The cloister arts included the painting and writing of manuscripts, the working of ivory plaques and all kinds of decorative jewellery, as applied to sacred objects or vestments. The hills that border the plains of Belgium and line the rivers that flow from the Ardennes supply material for decorative sculpture such as no other district of North Europe possesses. That Tournai tomb slabs, fonts, and sepulchral monuments were objects of wide export is proved by the many examples in England. The same was true of their shrine caskets.

However, the latter part of the twelfth century and the beginning of the thirteenth introduced a new element in Flemish style. The monastic bent that had dominated it is replaced by what we may call the masonic, taking that title from the Master Mason of French architecture who is so often wrongly called architect. Flemish church building, then, comes into connection with that outburst of constructive development which in North-East France began the career of French Gothic. The Sketch Book of Villars d'Honnecourt illustrates how Franco-Flemish masoncraft of Noyon, Soissons, and Laon obtained its peculiarities from the Tournai marble and stone sculptors.

In England we developed the Flemish marble-shafted style. But in the Low Countries themselves the thirteenth-century architecture passed under the French direction. The school of North-Eastern France dominated it. In its full development French style is represented by the great quire of Tournai, built at the end of the thirteenth century. This, as with the great quire of Beauvais or Le Mans, replaced the Romanesque apse, and, like them, it is a lantern of glazed stonework.

The Flemish thirteenth century had its church style under French control. Yet in that century the building that was to be specially expressive of the Flemish genius developed its most important monuments. The civic building of the Belgian cities was the architecture of citizens and craftsmen. It was this on a scale such as no other country has produced, for the palaces of Italy represent a different category of architectural expression.

Architecture itself was in the hands of the consummate Flemish craftsmen to elaborate itself with a decorative skin as inconsequential as the arches and crockets of their silversmiths. If French structure and plan remained to the end the underlying framework of Flemish churches, in their civic building the Flemish masons produced that surfacing of Gothic-constructed detail which in the fifteenth century was to develop into Flamboyant. Such rich late phases of Gothic as at Oudenarde were really the Gothic Baroque. The surfaces of architecture in such buildings have become frills and chiffons. They have monopolised the interest of art, and consequently develop as the fanciful forms of abstract design.

As early as 1300 the English masons began to make fancy-shaped arches. The keystone of an ogee arch is a negation of arch construction, for its shape denies the science of stability. But once when tracery was accepted as ornament it could take any fanciful form. Another example of the same tendency was the fourteenth-century use of the gable and pinnacle. The English masons multiplied their canopies and elaborated their diminutive framings, putting niche on niche and frilling them with cusps, crockets, and finials.

The absorption of English themes and then the use which the guild crafts of Flanders made of them is expressive of the political and social intimacy between the two countries. The four-centred arch was a peculiarity of English Perpendicular style which the Flemish builders, alone among the Continental builders, have borrowed from us. The English tabernacled niche became the constant stylistic convention of Flemish Gothic. In fact, the various features of decorative design, the resolution of architectural items into orders of ornamental sculpture, devised by the English masons, passed in the second half of the fourteenth century into the habit of Flemish building. They were to pass on in the fifteenth into France as Flamboyant.

Yet, said Professor Prior in conclusion, the absorption of English detail was but an episode, and the essential character of Flemish style was to appear as a whole system of design which was characteristically Flemish.

THE SOCIETY OF ARCHITECTS.

A MEETING of the Society of Architects was held on Thursday, the 11th inst. Mr. E. C. P. Monson, F.R.I.B.A., President, occupied the chair. After some preliminary business Mr. Alban H. Scott, Vice-President, read a paper entitled

THE CONSTRUCTION AND PROTECTION OF BUILDINGS IN RELATION TO FIRE.

With all the means at our disposal to-day for preventing and fighting fires, we still have appalling loss of life and damage to property through fire. Every year improvements are made in all branches to prevent such loss, and again every year seems to bring forward also more hazardous trades, more concentration and other causes of large loss. The development of the uses of celluloid and other inflammable substances has alone increased many risks.

Digitized by Google

Again, do not all the precautions taken add somewhat to people's carelessness or apathy, perhaps through a feeling of oversecurity? If only carefulness increased as the cube of the precautions, we should, indeed, see a great reduction of outbreaks of fire.

In giving a paper of this description, it would be impossible to do so without referring to that excellent institution, the British Fire Prevention Committee. It is only when one commences to study their valuable publications in detail that one fully realises the enormous ground such a committee covers; from the testing of flannelette up to the testing of heavy reinforced concrete floors, and special commissions and reports on what France and Russia have done in fire precautions.

It should always be remembered that every piece of wood and other combustible material used for the construction or in the fitting up of a building furnishes fuel for the fire.

In reading through the London Building Acts with fire precautions specially in mind, it is pleasing to note what great care has been taken generally regarding the construction of buildings from the fire point of view. In spite of all these precautions, however, additional provision for escape of occupants in case of fire should be provided and the powers given to the Council still further increased in this respect.

It would be advisable for the London Building Acts, and in fact all our by-laws throughout the country, to make it compulsory that all external walls and internal partitions and floors are constructed of fire-resisting material. This sounds perhaps rather a startling proposition, but if we just consider for a moment the following figures, it does not perhaps mean quite such a drastic expense as one would think from an outline statement.

The whole of the following costs have been based on the cost of materials current last week:—

	Per Ft. Sup. Pence
Floors. Wooden floors suitable for domestic buildings taken in spans of 12 feet	11.3
Fire-resisting floor, ditto	17.3
Wooden floors for workshop at 200 lb. super load per square foot. Spans 10 feet	28.9
Ditto, ditto. Fire-resisting floors	34.4
(Basis of last two items taken for floor 30 feet by 100 feet.)	
	Per Yard Sup. Pence
Cost of wood-framed partition, plastered on both sides, per yard super	72.8
Cost of fire-resisting partition, plastered on both sides	72.0

Although there has been, through various causes, such a levelling up of prices and gradual reduction in the difference of cost between fire-resisting and combustible materials, there is one point in the construction of work where this has not occurred quite so rapidly as one would perhaps desire—namely, in the construction of windows. Wooden windows have always been very much cheaper than steel windows, and, unfortunately, there is still a big difference. (This does not refer to steel sashes suitable for factories and workshops; these are cheaper than wood.) The London Building Act should perhaps be considered one of the wonders of the world. There is no Act in Great Britain more courteously, fairly, and sensibly interpreted and administered. It would, said Mr. Alban Scott, be a great mercy to the building owner, the community generally, and to architects if these Acts were in force through the country (with certain modifications), and administered by district surveyors of the same standard and training as in London.

Mr. Alban Scott then put forward suggestions as to amending various specified clauses in the London Building Acts which relate to fire prevention in its various aspects. For example, he considered that Clause 68 should read that all floors and staircases, irrespective of the size or use of the building, should be constructed of fire-resisting material, and further, the top floor constructed of such strength that if the roof is not also constructed of fire-resisting material it would successfully withstand the collapse of the roof in case of fire. Many fires have, he said, become a total loss owing to the roof or one floor collapsing and causing the whole series of floors to collapse like a pack of cards unsupported.

The paper then proceeded to slightly touch on the insurance companies' requirements. As to fire-resisting construction, they have various standards, such as Standard 1A, Standard 1B, Standard 2, and Standard 3. The standard 1A deals with cotton, flax, woollen and worsted mills. The standard 1B requires that buildings be not more than 80 feet in height, and cubic contents of any one compartment not to exceed 60,000 cubic feet.

I.—*Standard* 1B.—Walls to be of brick, or terra-cotta and concrete, not less than 13 inches thick, but if plain concrete not less than 20 inches.

Standard 2.—Walls to be of brick, or terra-cotta and concrete, not less than 13 inches thick, but if plain concrete not less than 13 inches thick.

Standard 3.—Walls to be of brick, terra-cotta or concrete not less than 9 inches thick.

II.—*Standard* 1B.—Partitions to be of incombustible material, excepting only office enclosures, which are to be of hard non-resinous wood.

Standard 2.—Partitions to be of incombustible material, excepting only office enclosures, which are to be of hard non-resinous wood, but partitions of metal lathing and plaster on wood frame allowed.

III.—*Standard* 1B.—All flues to have brickwork not less than 9 inches thick towards the interior, and no woodwork to rest in or be plugged into the brickwork of any flue.

Standard 2.—All flues to have brickwork not less than 9 inches thick towards the interior, and no woodwork to rest in or be plugged into the brickwork of any flue, but if rendered with 1-inch cement brickwork may be 4½ inches.

IV.—*Standard* 1B.—Openings in external walls not to exceed half the area of any storey.

Standard 2.—Openings in external walls not to exceed half the area of any storey.

V.—*Standard* 1B.—All window frames and sashes to be of iron or other hard metal, and all windows above ground floor to be glazed with glass not less than ¼ inch thick in sections not larger than 2 feet super., and all openings above the ground floor opposite, and within 20 feet of any window or other glazed opening, and within 20 feet of any roof to be protected by "fireproof" shutters or doors.

Standard 2.—All window frames and sashes to be of iron or other hard metal, and all windows above ground floor to be glazed with glass not less than ¼ inch thick in sections not larger than 2 feet super., and all openings above the ground floor opposite, and within 20 feet of any window or other glazed opening, and within 20 feet of any roof to be protected by "fireproof" shutters or doors, but in lieu of "fireproof" shutters wired glass may be used subject to certain conditions.

VI.—*Standard* 1B.—Floors to be brick arches, terra-cotta, fire-clay, or concrete not less than 6 inches thick.

Standard 2.—Floors to be brick arches, terra-cotta, fire-clay, or concrete not less than 6 inches thick.

Standard 3.—Floors to be brick arches, terra-cotta, fire-clay, or concrete, but 3 inches thick.

VII.—*Standard* 1B.—Wooden flooring permitted if laid close to floor with no space.

Standard 2.—Wooden flooring permitted if laid close to floor with no space.

Standard 3.—Wooden flooring permitted if laid close to floor with no space.

VIII.—*Standard* 1B.—Solid wood floors, not less than 9 inches thick if ceiled with plaster and covered with floor boards (no space), are also allowed provided water-proof lining is provided underneath the floor boards.

Standard 2.—Solid wood floors, not less than 9 inches thick if ceiled with plaster and covered with floor boards (no space), are also allowed provided water-proof lining is provided underneath the floor boards.

Standard 3.—Solid wood floors, not less than 6 inches thick if ceiled with plaster and covered with floor boards (no space), are also allowed provided water-proof lining is provided underneath the floor boards, and all supports and stanchions and other structural metal work covered with plaster or concrete, &c., ¾ inch thick.

IX.—*Standard* 1B.—Scuppers to carry off water to be provided of 21 square inches every 12 feet apart on each floor (buildings in C. of L. or L.C.C., scuppers not essential).

X.—*Standard* 1B.—Roofs to be entirely of incombustible materials as for floors, but not less than 4 inches thick. Glass not less than ¼ inch thick, in sections not exceeding 36 square inches, set in hard metal and wired glass and electro copper glazing considered as incombustible.

Standard 2.—Roofs to be entirely of incombustible material; glass allowed in roof if not less than ¼ inch thick

Digitized by Google

not exceeding 5 feet super., or wired glass or electro copper glazing in each case set in hard metal outlets to meet requirements of Factory and Workshop Acts allowed subject to certain conditions.

Standard 3.—Having no combustible material in its construction. Flat roofs of similar construction to solid wood floors, but 4 inches thick. No floor boards, but on upperside covered with metal, concrete, asphalte, or a composition of asbestos and other incombustible mineral ingredients or vulcanite having a coating of at least 2 inches of sand or gravel.

XI.—*Standard* 1B.—*Structural Metalwork.*—All columns and stanchions to be covered with brickwork or porous terra-cotta 2 inches thick, or concrete or plaster 1½ inches thick, keyed into metal supports and protected for a height of 4 feet from floor where cement concrete or plaster only used. All other metal work, including roof work, to be encased in porous terra-cotta 2 inches thick, securely anchored, or cement concrete or plaster 1 inch thick, keyed into metal supports. Provision to be made in all cases for expansion.

Standard 2.—All columns, stanchions, girders, joists, lintels, and other metal work (excluding framework of roofs), to be cased 2 inches thick or with 1 inch concrete or plaster as Standard 1B.

Standard 3.—See previous note.

XII.—*Standard* 1B.—*Roofs and Ceilings.*—No lining of wood or textile fabric allowed to any part of walls, partitions, ceilings, or roof.

Standard 2.—No lining of wood or textile fabric allowed to any part of walls, partitions, ceilings, or roof, except dado allowed in wood not exceeding 6 feet high in offices, cellars, staircases, and passages provided not used for storage.

XIII.—*Standard* 1B.—*Floor Openings.*—Only holes for driving shafts, iron or earthenware tubes for electric conductors, and these to be specially dealt with.

Standard 2.—Only holes for driving shafts, iron or earthenware tubes for electric conductors, and these to be specially dealt with.

Standard 3.—Only holes for driving shafts, iron or earthenware tubes for electric conductors, and these to be specially dealt with.

XIV.—*Standard* 1B.—Staircases practically as required for emergency exits by L.C.C. Where staircases and hoists extend to top floor, enclosure must be roofed with glass roof protected (subject to certain restrictions in L.C.C. area).

Standard 2.—Staircases practically as required for emergency exits by L.C.C. Where staircases and hoists extend to top floor, enclosure must be roofed with glass roof protected (subject to certain restrictions in L.C.C. area).

Standard 3.—Hoists to be enclosed in walls 6 inches concrete or R.C. 3 inches thick with fire-resisting doors. Sprouts or trunks not exceeding 4 inches square feet in area constructed of iron ⅛ inch thick and shutters to every opening.

XV.—*Standard* 1B.—All belting and rope races to be enclosed as for staircases and hoists.

Standard 2.—All belting and rope races to be enclosed as for staircases and hoists.

XVI.—*Standard* 1B.—Shafting through walls to fit closely into wall, and to have closed wall boxes leaving no open space.

Standard 2.—Shafting through walls to fit closely into wall, and to have closed wall boxes leaving no open space.

Standard 3.—Openings up to 12 square feet with double iron or metal covered trap doors (special construction).

XVII.—*Standard* 1B.—*Pipes, &c.*—No wooden casing allowed. All pipes (except water pipes not exceeding 1½ inches diameter) to be of hard metal.

Standard 2.—No wooden casing allowed. All pipes (except water pipes not exceeding 1½ inches diameter) to be of hard metal.

Standard 3.—Staircases having steps and landings of brick, stone, iron, concrete enclosed with walls, this applying also to vent shafts, all openings being protected.

XVIII.—*Standard* 1B.—*Communicating Compartments.*—Two or more compartments (constructed according to the rules), may communicate provided their aggregate cubical contents do not exceed 60,000 cubic feet. When cubic contents exceed 60,000 cubic feet communication only allowed across a fireproof compartment, built up from the basement with walls of solid brickwork, and having all openings protected by fireproof doors at least 6 feet apart.

XIX.—*Standard* 1B, *Standard* 2, *and Standard* 3.—*Reinforced Concrete.*—Reinforced concrete buildings allowed subject to the usual precautions. (*a*) The requirements as to proportion of cement in the concrete is somewhat ambiguous—viz.: "In the proportion of 6 cwt. of cement to each cubic yard of concrete." (*b*) All external walls to be not less than 6 inches thick (Standard 3, between piers 5 inches thick). (*c*) Division walls 8 inches thick (not Standard 3). (*d*) Party walls 13 inches thick except if adjoining reinforced concrete building, then 8 inches thick (Standard 1 only). (*e*) Floors 4 inches thick if lined with fire tiles 1½ inches thick (not Standard 3). (*f*) Floors 5 inches thick and supported on beams and columns of reinforced concrete (Standard 3, 3 inches thick). (*g*) Roofs 3 inches thick. (*h*) No metal to be nearer than double its diameter, but not less than 1 inch and need not exceed 2 inches. (*i*) Enclosures and staircase and hoists 6 inches thick (not Standard 2). (*j*) Fire-resisting compartments to have walls 8 inches and floor 5 inches thick (not Standard 2).

Under Standard IV., the party and external walls to be not less than 9 inches thick of brickwork, &c., and no combustible material to enter into any part of construction except the roofing, doors, and window frames. External walls of reinforced concrete 5 inches thick. Hoist enclosures to be of incombustible construction. Staircases may have steps and landings of hard wood.

The insurance companies' regulations as to fireproof doors and shutters are many and various; they deal with iron and steel (sliding and hinged), metal-covered doors (sliding and hinged), "check-fire" doors (sliding and hinged), ferro-concrete doors, &c.

The openings must not exceed 56 feet super., and not more than 7 feet 10 inches in width, or 9 feet in height. In some cases not to exceed 45 feet super, and not more than 6 feet in width or 8 feet in height. In other cases 35 feet super, and not more than 5 feet in width or 7 feet in height.

These rules generally are very careful as to fixing, and little details all of the greatest importance.

The use of cast-iron for door parts or fittings is not allowed.

Each door must have a metal plate attached giving the date of its erection, and in some cases the name of the maker. The fixing and method of securing fireproof doors and shutters is of the utmost importance.

The proper maintenance of this work should receive greater care than usual. Mr. Alban Scott said that within the last few days he was asked how long a "fireproof" shutter would last, and his report was five minutes. They were somewhat surprised to find that a loose wooden separating slip 6 inches wide had been inserted in lieu of a properly secured double rebated steel stanchion.

Many risks would be avoided, and much loss saved if all buildings were inspected and reported on every six or twelve months. Unfortunately, most people rely upon the insurance companies' inspections, which is not fair to any of the parties interested, particularly from the employees' point of view.

All the particulars given above as to insurance companies' requirements are of course subject to other rules as to special work, artificial lighting, &c.

There are many considerations to take into account when settling what form of construction to adopt (the local authorities make requirements as to exits for employees, and the insurance companies more particularly as to fire risk, but generally the better the insurance risk so is there less risk to employees). One immediate point is the comparative first cost, but this should be considered in relation to the reduction of insurance premium, and also the possible inconvenience to the works, and the loss of profit and loss of business connection. It is only the owner who can determine the value of the latter points. The insurance company determines the question of premiums. It is interesting to note that premiums can, under certain circumstances, be reduced as much as 60 per cent. This where large and valuable stocks are kept may be of great importance.

This leads on to the question of precautions for extinguishing fires, and big reductions in premiums are possible if care is taken as to these precautions, ranging from 5 to 40 per cent.

For fire extinguishing we have, speaking broadly, the following: Chemicals (dry and liquid), water (high and low pressures), steam, sand. And in addition various methods of smothering with sheets or blankets formed of various materials.

There are comparatively few large chemical machines, but generally these appliances take the form of small portable extincteurs, and no doubt in very many cases they have proved exceedingly useful, and saved big loss.

Digitized by Google

There are a very large number of these on shelves ready to be used in case of emergency; it would, however, be interesting to know the percentage of these that would be properly used, and undoubtedly their efficiency is greatly reduced owing to the lack of knowledge of proper use. Fortunately, the insurance companies have now standard requirements as to the manufacture of portable chemical extincteurs, including that they shall be stamped with maker's name, year of manufacture, capacity, and must bear a declaration that they have been tested to 350 lb. per square inch.

Water.—In spite of all scientific progress, water still maintains the premier position.

Science has, however, helped us to apply it in many ways, such as buckets, hand pumps, hydrants (private and public), with ordinary and high pressure, sprinklers, drenchers, &c.

Buckets, if judiciously placed and kept in their proper place, with water in them, are very valuable. If the buckets are provided and left to take care of themselves they may prove highly dangerous, as delay may cause loss of life, and heavy loss of stock. Even where certain people are put specially in charge of fire equipment, most constant and careful supervision is required.

If buckets are provided convenient draw-off taps for fresh supplies should be provided, and where rounded bases are provided to the pails, each draw-off tap should have a hook to hang the pail on during filling. Rounded bases have many disadvantages, and one advantage—viz. that they are not so readily taken down and used for other purposes.

Buckets of not less than two gallons' capacity, and three buckets to every 250 feet super should be provided, for which 5 per cent. on the reduction of premium is obtained.

Small portable hand pumps with water container are exceedingly useful, and should be provided more frequently.

Hydrants.—The degree of usefulness of private hydrants depends greatly upon the pressure in the mains. Generally speaking, the pressure is very low, varying from 20 lb. upwards. With 40 lb. pressure, good and useful work can be executed in skilled hands.

In laying down a hydrant installation connection to two different mains should be made if possible, but this is rendered still more valuable if such mains are fed from different sources. Where such double connection is made, back pressure valves are required. Pressure gauges should be put to each end of the hydrant mains. These should be frequently examined. It is also absolutely essential that the hydrant stands should also be periodically examined—that is, examined fully, hose connected, turned on and so kept in such a condition that immediate use can be obtained.

A general store, as central and as free as possible from fire risks, should contain additional hose and other equipment, including hatchets, hammers, crowbars, and the usual fitments. In works where there are several or many separate buildings, a detached central fire station is of most vital importance; this, of course, should be followed with the training of a certain number of the staff, and proper fire drill should be held throughout the works. Any employee who does not at once leave their work and proceed quietly and orderly to their assigned exit must be immediately dismissed. If this rule is not made and most rigidly enforced, fire drills may become a danger in lieu of a help. The necessary number of men should be put on point duty to switch off all fans, motors, gas, and similar appliances.

To come back to hydrants, the pressure on the private mains should, where possible, be fitted with an automatic pump to increase the pressure. This not only increases the height to which water can be thrown, but the quantity of water discharged in a given time is also increased with very high pressure. Special apparatus is required to hold the branch pipes. This increase of pressure has the further advantage of enabling a greater number of connections being taken from one hydrant; it is a great mistake to overload any hydrant or main—it is better to have a fewer number of efficient jets rather than a greater number of indifferent jets.

Sprinklers.—The insurance companies' rebate on premiums where sprinklers are installed varies according to standard of installation and other circumstances. The rebates, however, are in themselves an automatic testimonial for their efficiency, varying from 30 per cent. to 70 per cent. of the premium.

The arrangement in general is that every part of the floor area is covered by the action of sprinklers.

According to the standard required, the water supplies are connected to (1) town main, (2) elevated tank, (3) pressure tank, (4) pump, (5) injector apparatus, (6) elevated private reservoir, the requirements varying according to standard aimed at.

Two systems are in use, one the dry system—that is, the pipes throughout are not charged with water, but immediately a sprinkler goes off the water rushes through. The other system is where the whole system is constantly charged with water, and consequently immediately a sprinkler goes off the water comes into action.

The sprinkler heads are arranged to open at any temperature, but generally arranged for 155° F.; where, however, the requirements of the business demand, a higher temperature is fixed.

These heads have metal fasteners which fuse at the given temperature, and immediately give access for the water to discharge, this discharge being in the form of a cone, generally striking on the ceiling first and discharging in the form of a fire curtain of water, thoroughly drenching everything within its area, and at the same time, owing to its fine spray, practically acting as an oxygen excluder to the enclosed area, this being perhaps just as important a function as the actual water.

There is no fire risk (apart from damage caused by explosion) where sprinklers would not save the building, even if formed of wood.

Drenchers.—Fittings known as "drenchers" act in a similar way to sprinklers, but are generally placed just over the outside of the windows to prevent the fire spreading from one building to another.

If a little care and attention is given to the designing of a building with the idea of sprinklers being installed, the actual construction need not be less economical, and if the building is so designed considerable cost can be saved in the installation of sprinklers, as the rules demand that sprinklers shall be placed, generally speaking, about 10 feet centres, but this is subject to the depth of beams and for other similar obstructions on the ceilings. All spaces, such as voids in roofs, must also be provided with sprinklers, and with regard to the pressure of water required or desirable it should be remembered that all pressure is measured as running pressure. In addition to the normal pressure obtained by the head of water, increased pressure can be obtained by installing automatic pumps. To all sprinkler installations pressure gauges must be fixed together with a rather complicated system of valves, which, however, are not complicated in working.

Every installation must be fitted with approved automatic alarm signal which gives notice immediately any sprinkler is opened, and this alarm remains ringing as long as any sprinkler is in operation.

Steam.—The use of steam for extinguishing fire could and would no doubt be used to a greater extent if it were not that serious danger were attached to its use. It also has this serious disadvantage—that whereas water sprinklers can safely act automatically, serious accidents might result from steam being applied automatically in case of fire. Even if a steam installation is put in it must be only under the charge of one man, and some considerable delay must ensue before he turns the valve on, as it would be absolutely imperative for him to make sure that every part of the building was clear of employees. It is questionable if such an installation would be allowed by the authorities.

Sand.—Sand, if used at the very early stages of the fire, is exceedingly efficient, but its method of application—namely, by pails or similar means of throwing—curtails its action very considerably, as there are no means of applying it from a distance with any degree of accuracy, and it would of course lack a constant supply of application, but certainly a proportion of fire buckets should contain sand in lieu of water.

Automatic Fire-alarm Installations.—Automatic fire-alarm installations, apart from the automatic alarm attached to sprinklers, have progressed very considerably, and can be so arranged that they not only give fire alarms to the users of the premises, but keep also directly connected to a public fire station. These are generally installed upon the principle of thermostats, working with a variation of temperature, the whole being led to an annunciator which will immediately indicate where the fire has taken place. The insurance companies lay down very careful rules with regard to installations, and deal also with electrical work, testing, and maintenance.

DISCUSSION.

Mr. James, in proposing a vote of thanks, said he was very pleased to hear Mr. Alban Scott praise so highly the London Building Act. It had always been a puzzle to him that that Act was not made universal legislation. When many years ago he was articled to a district surveyor he came into contact with its administration and was struck then by the very fair way in which it was worked. The Act itself, if anything, requires strengthening. The provincial theatre was the greatest death-trap that could possibly exist; he hardly knew of a single one which was safe, for they were constructed with an utter disregard to the safety either of the audience or of the unfortunates behind the curtain. The position was a very serious one. Indeed, it was a puzzle to him why the Government did not introduce some measure—and in this the Society of Architects might do something—which would bring about a more universal use of the London Building Act as it stands. A constant danger in warehouses arose in the fact that so many of the big doors opened inwards—a fact which had lost dozens and dozens of lives. Sprinklers had the objection that they sometimes went off at unexpected moments. He would have liked to hear in the paper some reference to the value of the wooden girders used twenty years ago, for they had in his experience proved more fire-resisting than unprotected iron girders.

Mr. S. Bylander said that he had known Mr. Alban Scott as a man taking an intense interest in the structural standpoint of building. The paper was full of facts and definite points, and he congratulated the Society on having it in their possession. He would add his own wish and hope that the London Building Act would be read in a more friendly spirit than it is at the present day; it was an excellent measure, and it was of great assistance to architects and engineers to have such definite requirements to meet. The layman does not necessarily know what is advisable for his own protection, and some practitioners were chiefly concerned in trying to reduce the cost of building. The Act, however, might be revised as it was too complicated at the present time with its amendments and further amendments. He hoped that among any useful revisions made would be those advised by the lecturer. It was all very well to have 2 inches of fireproof protection around pillars, but it was even more necessary to have that protection properly secured to the metalwork. In an heavy fire followed by the application of a stream of water the fire-resisting blocks, unless secured, will fall down. Another serious cause of failure in the London Building Act was that it allowed a building to be carried over an unprotected girder across a shop. Very often these girders are carried on piers cased in brick or stone and very weak structurally. Some regard should be paid to the strength of a floor in a building. The cubic contents of a room ought to depend on the strength of the horizontal divisions and not solely on the vertical. Steel work is very safe and satisfactory so long as it is properly constructed and protected. In employing concrete as a means of fire protection the architect should avoid limestone, for that material is not satisfactory. Wherever steel work is used proper inspection must be made. He, personally, was very much in favour of the introduction of sprinklers, especially on the overhead or elevated tank system. Preparations must be made for supporting these tanks 15 feet above the level of the highest sprinklers.

Mr. Edwin O. Sachs congratulated the Society on carrying on its business as usual at the present time. Mr. Alban Scott was keenly interested in fire protection owing to his industrial practice. One of the important features of his paper was that part of it dealing with insurance companies. The number of things to do were rather complicated under the London Building Act and they ought to be codified. Many of the suggestions Mr. Alban Scott brought forward should be considered by the powers that be. The word "fireproof" was a misnomer and should be replaced by "fire-resisting" and "partially fire-resisting." As far back as 1870 the word "fireproof" was considered fraudulent. His own impression was that concrete is one of the most useful features in modern construction from the fire point of view; but the user must be most careful in the selection of the aggregate. The idea that reinforced concrete floors are fire-resisting irrespective of the thickness of protection for the metal work was a serious one. The bonding-in of the concrete round the steelwork was of the utmost importance. Architects should be wary of bad aggregates—flints are a most deplorable thing to have in concrete. The great London Building Act of 1851 has really saved innumerable fires by its strict limitation of the cubic contents. Now these regulations have been widened, but saving clauses exist. Architects ought to avoid powder extinguishers which must not be considered in the light of ordinary extinguishers. Chemical extinguishers should be really sound. It was well to remember that sufficient buckets to contain 100 gallons of water can be purchased for the same money as a very small number of patent extinguishers.

Mr. Gamble (London County Council) agreed that the loss of life through fire was appalling, but he pointed out that the great proportion of it was due to such small outbreaks that they could hardly be called fires at all. The death of the majority of those burnt in London was caused by such things as the throwing of lighted lamps or clothing catching fire. Very few deaths occur more than 12 feet or 14 feet above the ground. As an old borough surveyor he could assure them that in some towns the by-laws were very exacting, and it was an open question whether the London Building Act or the by-laws in the provinces were the better. Much was to be said on both sides. The building surveyor or the district surveyor in London was an officer with very large powers and one who could be trusted to carry out a great deal of the work in the way in which it should be. The local authorities in the provinces, however, were mostly controlled by families, and they were very jealous that their officials should not enjoy too much power. It was not altogether a question of the Building Act being administered by a certain set of trained gentlemen, but of the existing by-laws being enforced. In many towns they were administered by those whose knowledge did not allow them to take a "give and take" attitude. As to the subject under discussion, he would say it was very little use to carefully put up a building if year by year alterations are made and holes cut in walls and floors, or if it is employed for the storage of materials for which it was never intended. It was of the utmost importance that buildings should be periodically inspected. In talking of pressure, it was well to remember that very good pressure can be got through a ½-inch pipe.

Mr. Ellis Marsland said architects must face the difficulties of constructing in steel. Terra-cotta was a very bad material to use as a protection because under heat it expanded and split, leaving the metal work to get hot, then buckle, and so cause the structure to collapse. The most useful protection was concrete which should be made of the right sort of coke breeze. However, fire-resisting a building is made, and however much care is taken, the owner will always have to reckon on danger from adjoining buildings. Fire-resisting glazing in proper frames should be used for the outside.

After some further discussion the vote of thanks was then carried by acclamation.

Mr. A. Alban H. Scott having replied briefly to the many points raised, the meeting terminated.

TRANSVAAL SCHOOL OF ARCHITECTURE.

LOCAL TRAINING AND INITIATIVE.

MR. J. F. BEARDWOOD, President of the Association of Transvaal Architects, recently opened at Johannesburg the first exhibition of drawings by the architectural students at the South African School of Mines and Technology. Among those present were Professor Lawn, formerly Principal of the School of Mines; Messrs. Howden, Grainger, Fleming, Walter Reid, J. M. Solomon, Ivor Lewis Waugh, and other leading practitioners, and Mr. G. Gordon Leith, A.R.I.B.A., a Baker scholar, and the lecturer to the architectural classes.

The President (Mr. Beardwood) said that the members of the Association of Transvaal Architects felt that the Act under which they were constituted had hampered them considerably, inasmuch as they were unable to use their funds for the purpose of encouraging science and art. He hoped, however, that an effort would be made in the near future to have the terms of the Act so altered as to enable them to use their funds for that object, and to offer bursaries and scholarships towards the advancement of the architectural classes at the School of Mines. He considered that it was a national disgrace that they had such little public support from the Government towards the advancement of this subject. Some while ago it was almost a *fait accompli* that a National Chair of Architecture was established, but the movement fell through at the last moment; he hoped it would be renewed at no very distant date. They meant to make every effort in their power to bring this about.

Professor Lawn said that they were now well advised by the Council of the Association of Transvaal Architects, and

Digitized by Google

they were fortunate in securing the services of such an enthusiastic teacher as Mr. Gordon Leith. Such good, honest work was now being done that he hoped the time was not far distant when they would have a professor of architecture in a school of architecture worthy of Johannesburg and of South Africa.

Mr. Waugh said he looked forward to a very much greater expansion of the work accomplished by Mr. Gordon Leith and the students—work which he warmly appreciated. South Africa had had in the past to send its students overseas for training, but he was confident that South Africa would be able to produce architects in the same way as they had done in Australia by complete local training. The architecture of South Africa should have a thoroughly natural expression.

Mr. Gordon Leith, the lecturer, said that they were doing their best to work on progressive lines, and they would not be fettered by tradition. They were developing initiative and architectural expression based upon the direct study of the national resources of South Africa, and one which would comply with modern invention and economy.

LONDON COUNTY COUNCIL.

WORKING-CLASS DWELLINGS.

FURTHER reference was made at this week's meeting of the London County Council to the unsatisfactory position in the building world with regard to the erection of working-class dwellings. The Council was considering a report by the Housing of the Working Classes Committee dealing with the additional amount of working-class accommodation provided in London during the year 1913, and in closing the discussion the Chairman of the Committee, Mr. Bernard Holland, took exception to the suggestion that the Council was killing private enterprise by itself building cottages. "We cannot kill a thing which is already dead," declared Mr. Holland. Continuing, he said that the growth of buildings on the outskirts of London had practically stopped, and the position at the moment was extremely stagnant. One of the possible results of the war was that London might decline in population, and then there would not be the same urgent need for working-class dwellings.

This remark was received with laughter and cries of "No."

WILLIAM MORRIS AS A CRAFTSMAN.*

By MR. H. J. L. J. MASSE, M.A.

YOU have all heard of William Morris. Most of you know, or should know, something about him and his aims and objects, his work and his influence.

I will just refresh your memories by running briefly through his very busy life, and then refer to one or two questions of interest which arise out of it directly or indirectly—viz.:

(1) What was it that inspired Morris all through his life?

(2) What was his attitude towards the lesser arts?

(3) What do we owe to Morris—*i.e.* what was, and what has been, his influence both at home and abroad?

William Morris, poet, artist, manufacturer, Socialist, was one of the most striking personalities of the latter half of the nineteenth century, whether you consider him as a poet, as a designer, as a decorator, as a painter, as a producer or manufacturer, or as a Socialist; his influence as an artist, though he has been dead now some nineteen years, is still strongly felt. There is probably no part of the world that has not got stained glass, carpets, tapestries, textiles, and wall-papers from the firm of Morris & Co.

He was born at Walthamstow (then a village), in Essex, in 1834.

As a child of nine he used to ride half over Essex in search of old churches.

We know, too, that he used to ride about in a suit of armour in the forest.

This was due, no doubt, to his early knowledge and admiration for the writings of Sir W. Scott. He had read most of them by the time he was seven. He never remembered the time when he could not read for himself, for he had been delicate as a child and had fallen back on reading as a resource and amusement. He wrote as a boy and youth abominably badly. Later in life—*i.e.* when he took to illuminating his MS.—he formed an excellent formal hand, which he maintained for the rest of his life.

As a schoolboy he went to Marlborough, and stayed there till within a year of his going to Oxford. The discipline there seems to have been unusually lax, boys being left very much to themselves. Morris, however, made the fullest possible use of the excellent school library. A friend of mine who was there with him says he was a terrible storyteller (using the word in its literal sense). At Oxford he matriculated at Exeter College in 1852, and had the privilege of knowing it (Oxford) before the rebuilding mania set in. Of Oxford Morris said more than once: "It is a grievous thing to have to say, but say it I must, that the one most beautiful city in England, the city of Oxford, has been ravaged for many years past, not only by ignorant tradesmen, but by the university and college authorities." And in 1883, when lecturing in Oxford, he said: "When I remember the contrast between the Oxford of to-day and the Oxford which I first saw thirty years ago, I wonder I can face the misery of visiting it."

It is always said a man is known by his friends. Morris's chief friend at Oxford was Edward Burne-Jones, the Ned or Ned Jones of his letters of the time. Also there was Canon Dixon, Price, and Falkner. Of the two friends, Burne-Jones left Oxford without a degree; William Morris took his B.A. in 1856.

By 1855 Morris and Burne-Jones had surrounded themselves with a few kindred spirits, who assumed the title of a Brotherhood, and they at one time thought of all living together. On his coming of age, 1855, Morris found himself possessed of an income of nearly £1,000 a year—a fact which might have been disastrous for anyone who was not a William Morris.

His private means enabled him to finance the "Oxford and Cambridge Magazine," as the organ of the Brotherhood, and also to strike out for himself a career which to anyone who had to consider ways and means to the fraction of a penny would have been at that time practically impossible. People looked sideways at artists then. It was at Oxford that Morris found out that he was a poet.

He had gone up to Oxford with the intention of taking Holy Orders. So had Burne-Jones. But by 1856 he had abandoned the idea (so had Burne-Jones), and was articled as an architect to Street (whose office was then in Oxford), where he made friends with Philip Webb.

Moving to London when Street moved there, he set up a joint studio in Red Lion Square with Burne-Jones, both of them being then much under the influence of Rossetti.

Though he had worked hard for a time with the idea of being a painter, he had worked still harder at his poetry, and his "Defence of Guinevere" was published in 1858.

Much may be put down to Rossetti's influence—*e.g.* the treatment of the legend of King Arthur. Much, too, to the influence of Browning.

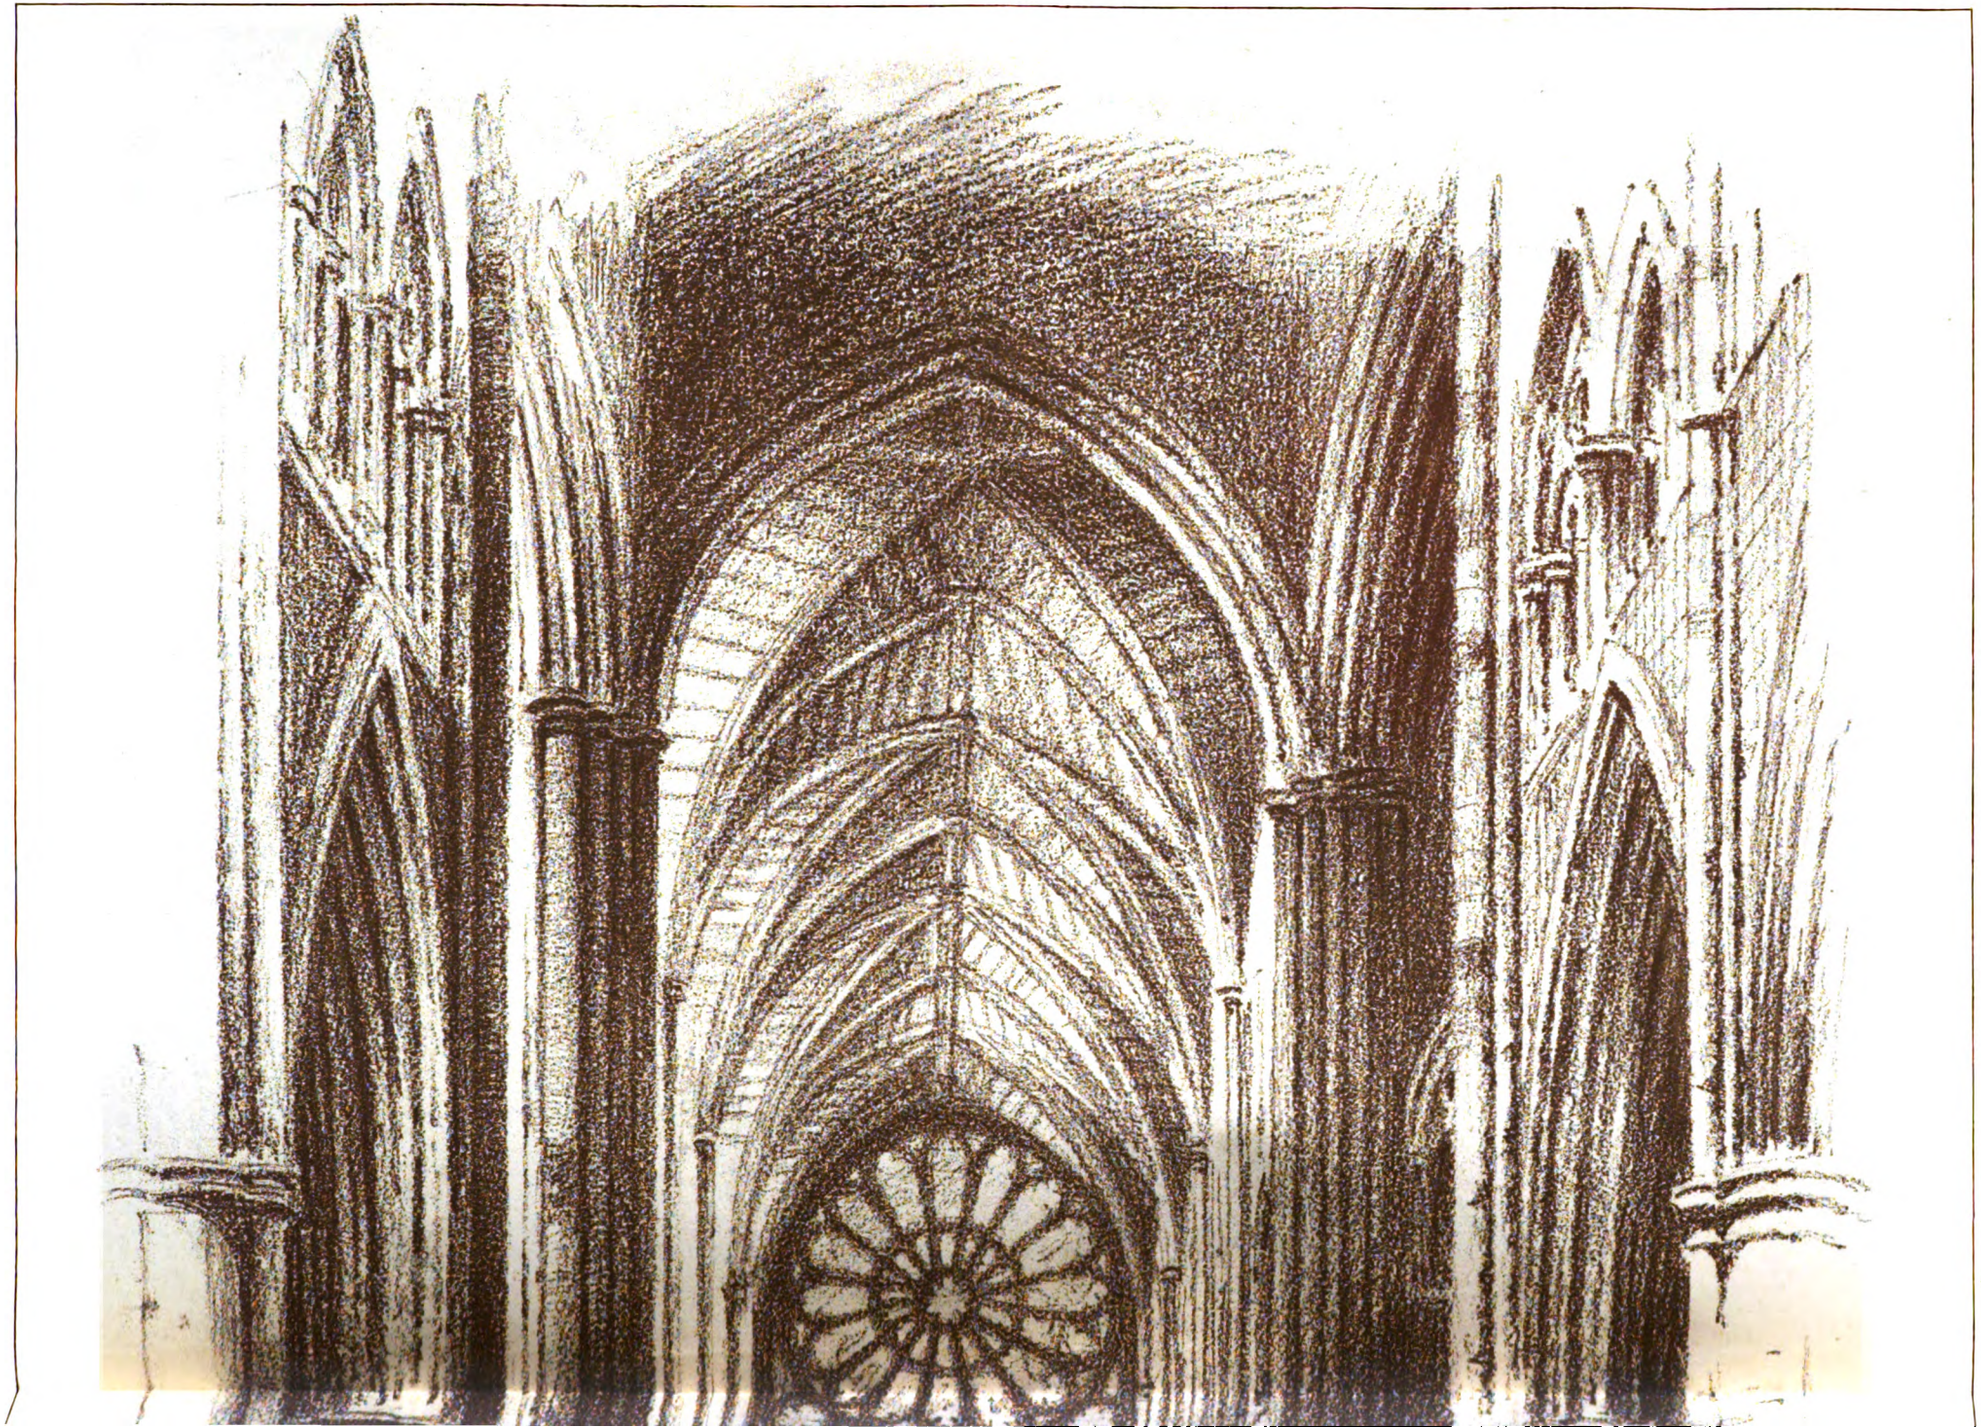
Becoming engaged in 1857 to an Oxford lady, Miss Jane Burden, it was necessary for Morris to find a house fit to live in. Failing in his quest, the only possible thing to do was to build one; and Philip Webb and Morris planned and built "The Red House," Upton, near Bexley Heath.

This house has been called "that wonderful red building which proved to be the prototype of all the beautiful houses of the so-called Queen Anne revival." But it really was Gothic, as Morris was himself, with traces of French influence.

It was the beginning of a new era in house-building. It was a living protest against the ugly square-box style of house with a slate lid.

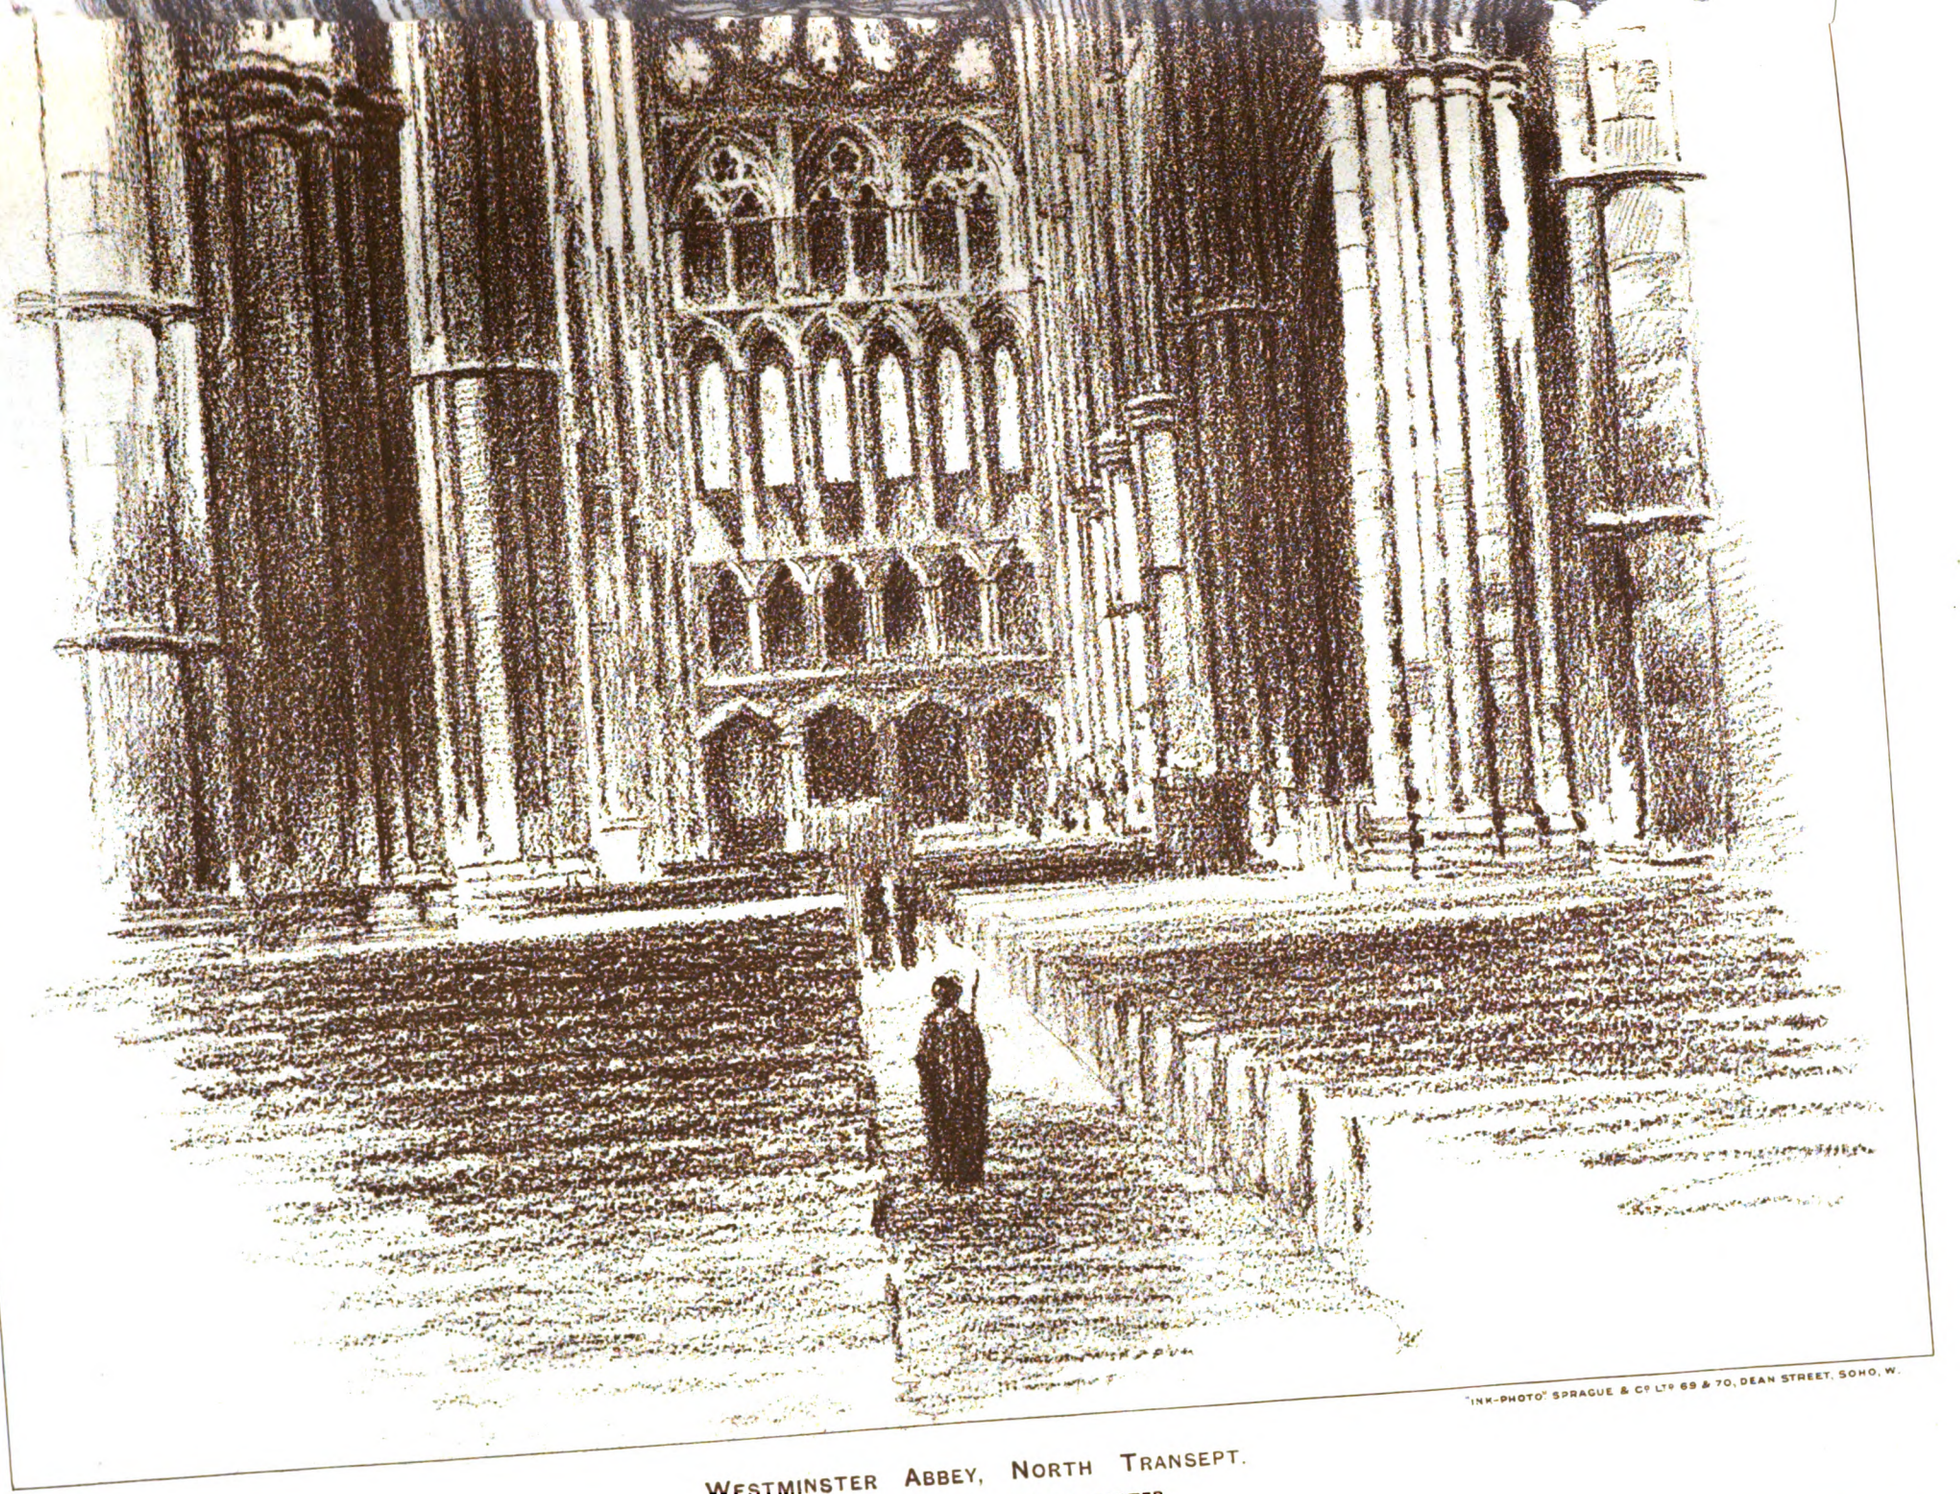
The difficulty experienced in getting furniture, glass, earthenware, china, and other things for domestic use led, in 1861, to the founding of the firm of Morris, Marshall, Falkner & Co. Later on it came to be Morris & Co. As a matter of fact, it was Morris, and always was so.

The firm exhibited at the International Exhibition in 1862, and obtained a medal for decorative furniture and tapestries, and another for stained-glass windows.



In this year Morris gave up all idea of being a painter of easel pictures, and finally turned his attention to the handicrafts and their revival.

As business increased quickly he found the travelling up to town wasted his time too much, and in 1865 he came back to town.



In Morris's endeavour to revive the crafts, no process

or method was left untried, and the general unsatisfactory state of the various crafts forced Morris to spend much time in making the raw materials he wanted for his own artistic use.

In 1866 Morris was given the chance of showing his powers as a decorator at the South Kensington Museum, now the Victoria and Albert Museum, where he did the small dining-room. It is known as the Green Dining Room.

It was a costly room to decorate (some thousands), and the authorities hesitated to clinch the bargain, but eventually it was settled, and it proved the cheapest in the end, for it is there to this day, and the walls have never had to be touched.

In 1871 he sought diligently for a house in the country, and finally took up his abode at the Manor House, Kelmscott, near Lechlade, Oxfordshire. It is a charming house, of two dates, beautifully situated on the Upper Thames, a few miles from Lechlade, Fairford, and Burford.

The name Kelmscott gave its name later to the London House on Hammersmith Mall that Morris took in 1878. From Kelmscott House, too, came the most famous of his many achievements, the Kelmscott Press—a press which, in its short lifetime, turned out books of a style and beauty beyond which a painter may not reasonably hope to go, and to which, if they work early and late, they may hardly as a rule hope to attain.

In 1881 Morris, as the work grew, looked about for additional workshops, and finally took Merton Abbey. It was then rather inaccessible, beyond Wimbledon, but was just what Morris wanted for his dyeing, his looms, and his other industries.

I saw it recently, and it is just the same as it was in Morris's time. Some of the "boys" of that time are the "men" of to-day. The neighbourhood has changed, being all built over, with trams passing the door.

The works at Merton were and are a revelation to anyone who knows the noisy din of a modern factory. They are rather a set of studios where the artists (for his workers were all that) worked at a leisurely pace, and used primitive methods in their dyeing, their printing of cotton fabrics, and their weaving, whether of priceless tapestries or of humbler carpets.

There was no steam engine. but a more poetic water wheel, and that was the keynote to the work of the place. Everything went on smoothly and sweetly. To go inside the place was like stepping back a century on the tide of time.

In 1890-91 Morris turned his attention to printed books, and in this branch of art perhaps made his high-water mark.

At the Arts and Crafts Exhibition of 1896 the printing by Morris—*i.e.*, the Kelmscott Press—was the most beautiful in the whole exhibition. That same year Morris died—just a couple of days after the exhibition had opened. The *Life of Morris*, by MacKail, is the most beautiful biography ever written in English, and in real English too, not the halfpenny newspaper jargon of journalism, but the language as it should be written and spoken.

Mr. Massé divided William Morris's life into four periods so far as it concerned the arts and crafts. First came decoration (*i.e.*, glass painting, designing, tile painting, furniture, and wall papers) from 1861 to 1874. Then came dyeing in 1875-6, then textiles (cretonnes, chintzes, carpets and tapestry) in 1877, and lastly, in 1890, printing, book decoration, and the Kelmscott Press. The periods were by no means exclusive of one another, and all this time the poetical life was going on side by side with the other occupations. His literary output may be imagined from the fact that it requires an edition of twenty-five large volumes to contain his work.

We are told that no man can serve two masters. Morris tried to serve the cause of Socialism and the cause of Art. With his strong sense of duty to his fellows he clave to the one, and in proportion as he gave up to it much of his time, both day and night, his energy and his money, so his devotion to the other—*i.e.*, his art—suffered, as it was inevitably certain to suffer. He honestly believed both to be bound up the one in the other. Had he not thought so he could hardly have done so much as he did for both.

What was it that inspired Morris all through his life as a craftsman? The answer to this is, "His passionate love of beauty," and the resulting hatred for the ugliness that was to be seen in everything around him. He did not go for beauty for his own enjoyment alone and at the expense of others. He thought, felt and acted upon the principle—his principle—that art was not for the privileged few—the so-called upper classes—but that art was to be made by the people and for the people as a happiness to the maker and to the user. He was never tired of saying that "Art was meant to raise man's life above the daily tangle of small things that weary him," and his theory was that the first step towards art worth having was to make the life of the worker worth living. He once said, "Let me say it, that either I have erred in the aim of my whole life, or that the welfare of these lesser arts involves the question of the content and self-respect of all craftsmen." He believed firmly that if only life were easier and men had time to look about them, they would learn to love art.

It must not be supposed that Morris with his own hand made all the things produced by Morris & Co. But nothing was done by them which he himself could not do, and which he had not learned to do so as to be able to teach others if and when required. This was one secret of his enormous power over men.

Two of his short pithy sayings are to be noted—"Delight in skill lies at the root of all art"; the other, "All real art is ornamental."

Morris admitted the necessity for frankly accepting machinery for the printing of wall-papers, and warned against trying to make the paper look as though painted by hand. He felt the need for beautiful patterns, and said that the designer, if impressed by some beautiful piece of nature, expresses his pleasure to others and gives them some of his own keen delight. "Without this," he declared, "a paper design will not be worth much; it will be but a makeshift expedient for covering a wall with something or other; and if we really care about art we shall not put up with something or other, but shall choose honest whitewash instead, on which sun and shadow play so pleasantly, if only our room be well planned and well shaped and look kindly on us." His excellent advice was, "Whatever you have in your rooms think first of the walls, for they are that which makes your house and your home; and if you don't make some sacrifice in their favour, you will find your chambers have a kind of makeshift, lodging-house look about them, however rich and handsome your movables may be." "Simplicity is the one thing needful in furnishing, of that I am certain." To this he added, "If our houses were only built as they should be, we should want such a little furniture and be so happy in that scantiness. Even as it is we should take as our maxim the less the better. Excess of furniture destroys the repose of a lazy man and is in the way of an industrious one; and if we really care for art, we shall always feel inclined to save on the superfluities that we may have wherewithal to spend on works of art." The golden rule which he thought would fit everybody's case was, "Have nothing in your houses that you do not know to be useful or believe to be beautiful."

Morris, in building "The Red House," inaugurated a new era in house building, planning and furnishing. That of itself led to a new era of decoration and a new birth for the minor arts. Wall papers have ceased in many cases to be ugly and inane, and have often become beautiful. Cretonnes and chintzes have become things of beauty. Woollen and other tapestries for hangings and silk brocades have been introduced with delightful patterns designed by men who can draw. Table glass has become a sight to gladden the eyes; furniture has become far simpler, more solid and genuine, practical and useful, and for that reason more beautiful. Carpets, too, have, in the main, become reasonable.

Of Morris's influence abroad it is enough to say that it has been stronger in Germany than in France. France remains true to French styles. Germany was glad to return to Morris and common-sense, after indulging in a bout of L'art Nouveau—the art of the undying worm as it has been called.

With all his love for architecture and his knowledge of it, Morris never directly built another house after the "Red House." He helped to make the creations of others beautiful, but he was satisfied for himself to get away to his beloved Kelmscott when he could. His love for it may be seen in his grief at the fears he had at one time that he might have to cease being its tenant.

Of his decoration of houses there is not time to say much. Of his own house, "The Red House," we read in the Life that the plastered walls and ceilings were treated in simple designs in tempera; for the hall and main living rooms a richer and more elaborate scheme of decoration was designed

and gradually executed. The drawing-room he said he meant to make the most beautiful room in England. In his own bedroom the wall was covered with hangings.

Morris was never afraid of pattern, yet out of his elaboration he could, where others would fail, get repose. This was due to his colour sense and his command of it. As he used to say, "The result of decoration must be colour, not colours." He considered that anyone who preferred bare walls must be in an unhealthy state of mind and probably of body also.

Lewis F. Day has stated that Morris felt his least satisfactory work was in the direction of stained glass, as he was so dependent upon others. At first Madox Brown used to draw the cartoons, and then later Sir E. Burne-Jones; but the colour was always Morris, and no one else. The firm still goes on producing, as always, very fine glass indeed, secular and ecclesiastical.

Of his printing, which was superlatively beautiful, the influence to-day is, perhaps, the strongest and steadiest. He gave the final fillip to the earlier strivings for better printing. The point he made in printing was that the thing to go for in a book was not the title page or any one page, but the effect produced by the opening of two pages in the book. He also insisted on good paper; no wood pulp and superfine art surfaces for him. And he insisted on good black ink.

Morris was absolutely thorough in everything; but he was thorough in one thing at a time to the exclusion of all else. Hence we have his life divided into periods. He set up an ideal and one of absolute perfection, and to that end he worked with all the intensity of his nature—with the ideal once attained he was ready for some other field of energy. In this way he preserved his buoyancy and his spontaneity even when doing the work of ten ordinary men.

He was naturally simple—that is, fond of simplicity in living and all else. That is why he was in reality a Gothic personality and of the thirteenth century in his heart. He considered it our duty "to abstain from multiplying our material wants unnecessarily . . . and to see that the articles we do use are the works of free men and not of slaves." He hated compromise and makeshift of any kind; he was so genuinely straight himself. He was characteristically impatient, and that is why his language sometimes effervesced with expressions that would not look well in print.

He was an excellent man of business, though he thought the ordinary ways of trade low and mean in the extreme. He was not grasping, and would have been content to see but a small return on his fabrics and his books.

He said that the greatest pleasure in life was the pleasure of creating beautiful things. In this respect, as Lewis F. Day wrote of him, "He may be counted a very happy man."

You could not see him on the platform without being impressed. He was short, stocky, powerfully built, and stalwart, sturdy and strong. There was no swagger or side, but there was the look of a man who felt he was right. He was fresh in complexion, with an unkempt beard; and his hair, very dark in youth and luxuriant, standing like a mane from his massive forehead, gave him the look of a lion. His eyes were grey, with a far off dreamy look, but quite able to laugh with merriment, to kindle like fire with enthusiasm, or to flash with indignation. He was not an orator, but his words were incisive and always to the point, and his voice deepened as he spoke.

As Lewis F. Day wrote of him, "To see him was to know him for a rebel born. He was inclined, at times at all events, to divide men into two classes, flunkies and rebels; and he was not content to be a rebel himself, but professed his desire to stir up rebellion in others against what to him was intolerable. The law? What law? Who made it law? Conformity to him was slavery. He would follow no custom. Usage? That was a reason for not doing likewise. His behaviour was individualistic absolutely; he dressed, spoke, did as pleased himself, and had nothing but contempt for orthodoxy of whatever kind. And with all this he was a Socialist, and a militant one, convinced that he saw in Socialism a way out of the degradation into which Society (and modern art and workmanship accordingly) had fallen. He never seemed to suspect that Socialism (as understood by his political brethren) would leave less room than ever for the free action of a man—of a man, that is to say, as distinguished from a sheep."

Morris always said he was a Goth. He had gone up to Oxford with no definite ideas as to art, except that he hated the Great Fair of 1851—his expression for the Great Exhibition of that year. His feeling was for mediæval times, and the so-called Gothic revival of Pugin and others fitted in very well with his sympathy for the earlier centuries of our history.

Morris once said that if he were unable to work he would die of weariness and despair. If he had his choice he would have died as he did (ten years before his time) in full harness rather than live on powerless either in mind or body and helpless to work.

BY-LAWS AND THE HOUSING QUESTION.*

By W. H. A. COURT, Assoc.M.Inst.C.E., Borough Engineer's Department, Leicester.

THE question of the housing of the working classes is one which has attained some importance in the last few years, and, in view of current events, seems destined to hold a prominent place amongst the problems of the day.

Into a number of the reasons advanced for the cessation of private enterprise in the provision of dwellings for the working classes the author does not propose to enter, for obvious reasons. One must be mentioned, however. This is the difficulty which appears to be experienced by speculative builders (the word "speculative" is used here in a good sense) in erecting cottages at a low rent to give sufficient return for their outlay. This difficulty is partly attributed, by builders and architects alike, to unnecessary stringency in the model by-laws and the local by-laws, which are, of course, based upon them, with, in most cases, considerable amplification.

With regard to the criticisms of the by-laws raised by architects of eminence and great repute, one point has always appeared to the author to stand out. This point is that they appear to overlook the fact that the by-laws have been framed with the object of endeavouring to meet all cases, and not for the ideal conditions with which these architects, because of their eminence, have to deal. The author hopes to demonstrate his meaning more clearly in dealing with a few actual instances which have been cited in these charges against the working of the model by-laws in particular, and possibly one or two in force in the particular district in which the author is engaged.

To get at a reason for the excessive cost of cottage building, and the extent of the culpability of the by-laws in this direction, the author proposes to consider the cost under three heads, viz.:—

(1) The cost of the site;

(2) The cost of the building proper; and

(3) The cost of making the roads in which the building is situated.

With regard to the first—namely, the cost of the site—this may be dismissed at once, as the by-laws will have no influence on the matter.

The cost of the building itself has now to be considered.

In a paper read before the Royal Sanitary Institute by Mr. H. D. Searles-Wood, F.R.I.B.A., and published in the Journal of the Institute in October 1913, "The Architect's Grievance against the Model By-laws" is rather fully set out. The author of that paper quoted from a number of other papers read before other societies, with the same object in view. The deposit of drawings, &c., for the approval of the local authority is one of the points mentioned, and the interpretation put upon the by-laws by the officials in their inspection of these plans. In this connection the issue is somewhat obscured by the claim that all artistic effect is suppressed, or, at any rate, that the tendency is in that direction. To remedy the repressing effects of the over-zealous building inspector, a Court of Appeal is proposed, by which it is hoped to obtain precedents for future cases to be fought out, and to render "elastic" the present cast-iron regulations. The difficulty of carrying out by-laws as they stand is already a sufficiently onerous task. If they were to be increased in the way suggested, it appears to the author to render the office of the surveyor and building inspector untenable. The cost of the building would not, at any rate, be reduced.

One great stumbling block appears to be the minimum height of rooms. This was not contained in the original by-laws, and was added in 1891.

It has been proposed to reduce the height of rooms to 7 feet 6 inches. This appears to be the lowest limit generally reached. Such a reduction would certainly save, on the ground floor, 1 foot of brickwork, and on the first floor a

similar amount. This would be, without doubt, a considerable saving in the cost of construction. But surely it would not be wise at this time to suggest that the cost of a building should be reduced at the expense of the health of its inhabitants? This point was raised at the meeting of the East Midland District held at Newark in February 1912. The case of a farm labourer's cottage was mentioned, in which the living room was about 6 feet 6 inches, and held the man and all his family. After a wet day in the open, a big fire in the evening with all the members of the family present, and the windows closed, the state of the air in the upper part of the room, at about the breathing level, can be more elegantly left to the imagination than to description.

The usual reply to this is that the workers must be educated to the beneficial results of fresh air and ventilation. It would appear to be safer to educate them to this idea in comparatively lofty rooms rather than to provide the lower level to the ceiling and to educate them afterwards.

The same arguments apply to bedrooms, but with added force. Space would undoubtedly be saved (and, with it, cost) were rooms in the roof not subjected to these restrictions. But here dormer windows are unavoidable, and consequently light must be, to a greater or less extent, kept out of such rooms, and with the light the beneficial effects of direct sunlight, well known to have great germ-destroying powers. Ventilation of such rooms would also be much more difficult. Further, the low portions of the rooms round the walls, being more difficult of access, could not be so easily kept clean. This may not be of such importance in the large houses in suburban districts (which are the houses probably in the minds of the architects in question), but in houses of the class under discussion the author's own idea is that they should be so designed as to give every opportunity for being cleansed in the easiest possible manner, and that plenty of light should be accessible to every part of the room.

Reference may also be made at this point to the height of windows, though this will have small effect on the cost of the building. In the Leicester local by-laws it is required that at least one window in each room shall extend to a height of not less than 7 feet 6 inches above the floor, and that the upper half, at least, shall be made to open. This seems a very reasonable requirement, and ensures that rooms can be ventilated above the heads of the occupants, whereas, were the windows lower, at, say, 6 feet from the floor, the incoming air would create a draught at the level of the head.

It must also be noted that these by-laws are for the regulation of the builders, to ensure that they provide the means of thorough ventilation. It would be useless to educate the inhabitants in the advantages of fresh air and cleanliness were they compelled, owing to scarcity of houses, to live in dwellings where they would be unable to enjoy these advantages.

Another means which has been proposed for effecting the ventilation of rooms is by constructing a flue, with branches for each room, by the side of the chimney flue, and carried up above the roof with it. This would undoubtedly be extremely useful for the purpose, and the ventilation of the apartments would not be so dependent upon the opening of the windows by the occupants. On the other hand, the extra cost would take up the saving effected by reducing the height of the rooms. Consequently the gain appears to be nil.

To the author's mind the direction in which economies may be looked for in the future will be found in careful planning (leaving the artistic elevations to follow the plan), and in the use of cheaper materials of construction in the minimum quantities.

Provision is made for this in the new model by-laws (Series IV., draft form), by which (Section 25, Sub-section b) concrete, plain or reinforced, may be used "of such thickness as shall be necessary to secure due stability."

The third item in the summary of expense—namely, the street-making—must now be considered. Possibly it is in this item that the greatest initial saving may be effected. It is also in this direction that the greatest variation in the requirements of different districts may be found. It is, therefore, only proposed here to deal with the by-laws of the borough of Leicester. Here there are two standard types of streets—namely, the 40-foot roadway paved with granite setts, and the 50-foot roadway with water-bound or tar-macadam carriageways. In each type the footpaths are laid with concrete slabs. These roads, and especially the first-mentioned and much more numerous kind, are certainly expensive to construct. It has been claimed that "over two-thirds of the cost of cottage building sites is" taken up by "these superior streets." There is another side to this, however, and that is the low cost of maintenance, repair, and cleansing. Were a large number of streets of less endurable description to be thrown upon the hands of the Corporation to maintain and repair, a very large increase in the annual cost of highway repair would ensue. This would result in an increase in the local rates, and would naturally tend to produce that overcrowding which it is the object, by providing increased accommodation, to prevent.

A number of extremely clever and ingenious proposals have been made to cheapen these streets, and one should be mentioned in particular. Starting from the proposition that repair is necessary in order to replace wear, the next step, evidently, was to find means to prevent wear. This was accomplished by having only a limited number of "through" streets, the remainder only being accessible to wheeled vehicles for half the length from each end, a set of post or a small clump of trees being placed in the middle of the length to stop through traffic. This would undoubtedly be efficacious in preventing excessive wear, and would allow of less enduring construction. The author is not so sure of the moral effect on a carter with, say, a big load of coal, who might arrive into one of these "blind" streets by mistake. There probably would be further difficulties in the case of fire.

The author is of opinion that this paper will be considered to consist chiefly of destructive criticism. Any discussion will, he hopes, bring forward something constructive, however.

In conclusion, he apologises for the scattered nature of these few notes, which has been due to want of time owing to pressure of business.

BUILDING PROGRESS IN THE PROVINCES AND SUBURBS.

A LIST OF WORKS PROJECTED OR COMMENCED.

(N.B.—Local Authorities, architects, and others are invited to submit full particulars for insertion in this weekly list. Where districts are not entered against names of architects and builders the address is as a rule local.)

Correspondence

[The Editor will not be responsible for the opinions expressed by Correspondents.]

Building Exhibition, Olympia.

SIR,—I notice in your issue of February 5 you state that there would be a difficulty in renting Olympia this spring.

I should like to point out that this is not the reason why the contemplated Building Exhibition was abandoned. We had actually engaged the hall for the dates as advertised, and the War Office had agreed to relinquish their tenancy for the time being.

The only reason for postponement was the present condition of affairs, which does not justify the holding of exhibitions of this nature.—I am, yours faithfully,

H. GREVILLE MONTGOMERY.

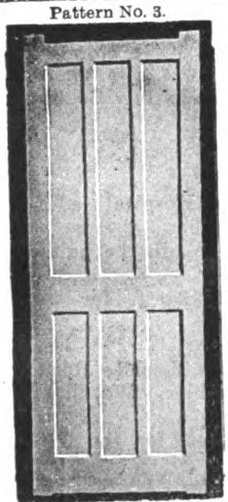
43 Essex Street, Strand, London, W.C.

Belgian Ruins.

SIR,—One of your daily illustrated contemporaries (already trounced in my article of your issue of January 22) is at its old tricks of mystification again. On February 11 it gave a picture of a hole made by a shell in the road close to "a cathedral in Belgium." As there were views of Soissons, Arras, Albert, and other ruins on the same double page, what was the object of the exasperating and silly withholding of the name of the cathedral?

Such action on the part of the Editor was not done at the bidding of the Censor, and therefore deserves to be shown up, with a view to such literary antics being relegated to the past, and to prevent them in the future.

In its issue of the 13th instant the brilliant paper in question gave a view of a narrow street in ruins, with three plain Renaissance arches on columns at the far end, facing the camera. It purported to be a view of the remains of Visé Town Hall, which was stated below to have been one of the "beautiful mediæval structures" Belgium has now lost! It was not even mentioned in Baedeker's "Belgium."



Another strange blunder in reporting occurred a little while ago, which I forgot to allude to in my article—viz. that the inhabitants of a certain town, while shells were falling in it, hid in *caves*! The nearest caves were at least twenty miles away. The telegrams gave, originally, the word "caves," which is French for cellars. The transcriber clearly thought he knew best.—Yours faithfully,

NON-IGNOTUS.

Feb. 13, 1915.

THE
Architect and Contract Reporter.
FRIDAY, FEBRUARY 19, 1915.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addresed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than* 2 P.M. *on Thursdays.*

COMPETITIONS OPEN.

BRADFORD.—March 31.—The Corporation invite competitive designs for the re-planning of streets in the central area of the City of Bradford. Mr. Reginald Blomfield, R.A., will act as assessor. Particulars may be obtained on application to the undersigned, accompanied by a deposit of £1 1*s*., which will be returned on receipt of a *bonâ-fide* design. Mr. Frederick Stevens, Town Clerk, Town Hall, Bradford.

COVENTRY.—The City Council invite competitive sketch plans for the erection of a public elementary school at Folly Lane, Coventry. The competition is strictly limited to architects practising in the City of Coventry. Particulars of the competition may be obtained on application at the Education Office, 44 Bayley Lane, Coventry.

CONTRACTS OPEN.

ATHERSTONE.—Feb. 22.—For erection of a public convenience in Station Street, for the Rural District Council. Mr. H. J. Coleby, engineer and surveyor, 102 Long Street, Atherstone.

BANWELL.—March 1.—For erection of a Council school at Banwell, for the Somerset County Council. Messrs. Jane & Fry, architects, Waterloo Street, Weston-super-Mare.

BARMING HEATH.—March 4.—For erection of an assistant medical officer's house at the Lunatic Asylum, for the Kent County Asylums Committee. The Engineer at the Asylum, Barming Heath, near Maidstone.

BARNSLEY.—March 4.—For erection of a new Town Hall in Church Street. Deposit £2 2*s*. Mr. W. P. Donald, Town Clerk, Town Clerk's Office, Barnsley.

BIRMINGHAM.—Feb. 25.—For foundations, &c., for a new shed in connection with the telegraph stores, Birmingham, for the Commissioners of H.M. Works and Public Buildings. Deposit £1 1*s*. The Assistant Architect, H.M. Office of Works, 42 Paradise Street, Birmingham, and H.M. Office of Works, &c., Storey's Gate, S.W.

BISHOP'S STORTFORD.—March 1.—For alterations and additions to Northgate County Council School, for the Hertfordshire County Council. Deposit £2 2*s*. Mr. J. S. Killick, county surveyor, Hatfield.

BRISTOL.—Feb. 23.—For erection of tower and main buildings of the University of Bristol. Send names and addresses to the architects not later than Feb. 23. When applying state what important buildings of a similar character have been built by them, and at what contract price, and from whose designs, giving architect's name for reference. From the applications received it is intended that names shall be selected for invitation to tender; but no name will necessarily be selected. Contents of building: probably upwards of three million cubic feet. Materials: principally local ragstone with freestone facings and dressings. Fireproof construction. Heavy English oak timbers for roofing. Joinery: English oak and other timber. Send applications by Feb. 23 to Messrs. Oatley & Lawrence, architects, 25 Orchard Street, Bristol.

CHRISTCHURCH.—Feb. 27.—For erection of a mortuary at their premises, Fairmile House, for the Guardians. Deposit £5. Mr. A. Druitt, clerk, Board Room, Fairmile House, Christchurch, Hants.

COALVILLE.—Feb. 26.—For erection of business premises, comprising three shops with showrooms and workshops over in Belvoir Road, for the Coalville Working Men's Co-operative Society, Ltd. Deposit £3 3*s*. Mr. T. I. McCarthy, architect, Central Chambers, Coalville, near Leicester.

DUNSTABLE.—March 2.—For erection of two additional wards on the site of the isolation hospital at Kensworth Lane, for the Dunstable and District Hospital Joint Committee. Deposit £2 2*s*. The Surveyor's Office, Town Hall, Dunstable.

EDMONTON.—Feb. 24.—For erecting and finishing fit for use an additional storey over the Board-room block and certain alterations to same at Edmonton House, Bridport Road, Upper Edmonton, for the Guardians of Edmonton Union. Mr. J. C. S. Mummery, architect, 13 Fitzroy Square, W.

HUDDERSFIELD.—Feb. 25.—For proposed children's pavilion, to be erected by the Corporation at Bradley Gate, for the executors of the late John Sykes, J.P. Various trades as follows: (1) Mason and bricklayer (no drains, walks, or roadways); (2) concretor; (3) joiner and carpenter; (4) plumber, electrician, and heating; (5) plasterer; (6) slater; (7) painter. Mr. W. Cooper, F.R.I.B.A., architect, 4 Kirkgate Buildings, Huddersfield.

HUDDERSFIELD.—March 2.—For the various trades required to be executed in erection of a tuberculosis hospital at Bradley Gate, for the Corporation—viz.: (Contract No. 1) roads and drainage; (2) excavator, bricklayer and mason;

A Sweeping Reform

The old-time style of sweeping is really Gilbertian in its futility. At its worst it scatters dormant dust, sending it broadcast to find new resting places. At its best it merely collects surface dirt, and only as much of that as can be actually reached by the broom or brush. Whilst this kind of sweeping is in progress all stock, fixtures, and furniture must be covered with cloths to protect them from the dust clouds. The process is makeshift and prolonged.

CONSIDER THE OTOVACUM WAY

Old Methods.

THE
Otovacum Turbine Cleaner

is a hungry machine with a tireless appetite for dirt of all kinds. Cleans floors, walls, ceilings, fixtures, furniture, hangings. Cleans carpets thoroughly—gets at the deep down dirt, leaving them clean, sweet, and new looking. It is easy to operate, costs very little to work, performs its work swiftly and effectively. An Otovacum Turbine Machine stowed away in the basement or any out-of-the-way corner, driven by electricity—requires no attention, only a little oil occasionally.

For building shopping premises in High Street, Swadlincote, for Mr. James Woodward. Mr. GORDON ALLEN, A.R.I.B.A., architect, 13 Holmdale Road, West Hampstead, N.W.

EDWIN CLARKE, Woodville (*accepted*)	£1,026 0 0

TORRINGTON.

For the erection of five cottages in Well Street, for the Town Council.

DARCH (*accepted*)	£1,027 19 9

THE church of St. Olave, Hanbury Street, Mile End, is about to be pulled down and its site and the vicarage sold. The church, which was built in 1876, has been disused for some time past. The church hall will be retained. The proceeds of the sale will be devoted to the erection of a new church at Harlesden, dedicated to St. Mark. The parish of St. Olave has been added to that of All Saints, Buxton Street, from which it was separated in 1876.

ROTHERHAM Borough Council recently appointed as their surveyor, at a commencing salary of £500, rising to £700, Mr. William Shackleton, M.I.C.E., the Borough Surveyor of Nelson. Yielding to pressure, Mr. Shackleton has decided to retain the Borough Surveyorship of Nelson, and has been granted an advance of salary. The Nelson Town Council has several important schemes in hand at present. Mr. T. P. Collinge, Borough Engineer and Surveyor of Mansfield, was second on the list for the appointment.

THE Plymouth Borough Council, at their meeting last week, approved the proposed extension of the Borough Lunatic Asylum at Blackadon to accommodate 440 additional patients, and that Messrs. Thornely, Rooke & Barron, architects, be instructed to prepare plans. The cost of the extension is estimated by the borough treasurer at £100.000, and the annual cost of interest and sinking fund, after deducting lodging money now paid by Devonport and Stonehouse patients, being excess over the Plymouth rate of maintenance of 10*s.* 7*d.* per week, works out at £2,647, or equivalent to a net increase in cost to the rates of two-thirds of a penny in the £.

FACULTY OF SURVEYORS OF SCOTLAND.

MR. ALAN K. SMITH occupied the chair at the annual general meeting of Fellows of the East District Section of the Faculty of Surveyors of Scotland, which was held at 117 George Street, Edinburgh, on the 12th inst. The annual report showed an increase of thirteen in the number of members on the roll compared with the preceding year. During the year the Council had been principally engaged, in conjunction with the West District Section of the Faculty, the architectural societies, and the Scottish National Building Trades Federation, in adjusting a national mode of measurement for carpenter and joiner work. The funds at December 31, 1914, amounted to £250 2*s.* 10*d.* The Chairman, in moving the adoption of the report and accounts, stated that a considerable number of Fellows, assistants, and apprentices were engaged with H.M. Forces, and that a complete list was being compiled. The report and accounts were adopted. Messrs. Robert Jerdan, F.F.S., Edinburgh, and William Gauldie, F.F.S., Dundee, were appointed new members of Council.

The second annual general meeting of the West District Section of the Faculty of Surveyors of Scotland was held in the Christian Institute, Glasgow, on the 11th inst. Mr. Howatt, Chairman, presided over a large attendance of members. Mr. Howatt, on demitting office as Chairman of the West District Section, received a cordial vote of thanks for the services he has rendered to the Faculty during his two years of office. The following office-bearers for session 1915 were elected:—Chairman, Mr. John Baxter, 243 St. Vincent Street, Glasgow, who also becomes *ex-officio* Vice-President of the Faculty; secretary and treasurer, Mr. William Johnstone, 150 St. Vincent Street, Glasgow.

THE VACUUM CLEANER.

THE removal of dust by vacuum cleaners is in principle so hygienically sound that when once it had been proved to be possible to remove all dust from floors, walls, carpets, furniture, &c., by a system of air suction (which not only extracted the dust but also conveyed it beyond the walls of the building) it became a question only of how quickly it would be universally adopted. At the present time it can hardly be said to have achieved such general use, but in all new buildings, such as hospitals, public offices, warehouses, stores, &c., an installation for vacuum cleaning is provided for in the plans, and in some form is to be found in most houses even when otherwise unpretentious.

The principle being accepted, it naturally followed that numerous devices for accomplishing it should be put on the market, having in common the extraction of dust by means of the exhaustion of air, but differing in the mechanism by which it is effected.

In the smaller cleaners the motor is actuated by current taken from the electric-light connections, but as their cleaning capacity is limited they are only adequate to the area of a moderate-sized house. For larger buildings the power has been obtained from the water supply or the air displacement effected by pumps or ejectors, and each system, when fitted by competent firms, has provided a satisfactory means of extracting and disposing of dust.

To obtain the fullest efficiency from vacuum cleaning it is necessary that a stationary plant be installed in the basement, with permanent suction mains running through the various floors, having connecting-points at convenient intervals on each floor for attaching the flexible hose, to which is fixed the cleaning implement, and through which the dust-laden air is conveyed and exhausted outside the building.

The Sturtevant Engineering Company, Ltd., have brought their long and varied experience in designing apparatus for controlling the movement of air and rendering it a useful servant to bear upon the subject of vacuum cleaning, which is embodied in the Turbine Vacuum Cleaner. By their high-pressure electric Air Turbine they obtain the movement of a large volume of air at a high velocity at constant pressure, fluctuating automatically to meet the varying conditions of cleaning, whilst maintaining the full intensity of suction. This provides that at each cleaning-point the suction is efficient whether one or six are being used at the same time, and as they do not develop a very high vacuum when working against resistance, there is no risk of damage to carpets, tapestries, or upholstery.

An important feature about this cleaner is that the amount of current consumed is regulated by the number of operators at work. Its fresh air displacement, irrespective of the size of the installation, should be not less than 80-100 cubic feet per minute per cleaning implement. The plant has been designed with a special effort towards simplicity; there is nothing which, presuming reasonable care is taken, should get out of order.

ENGINEERING OPERATIONS FOR THE PREVENTION OF MALARIA.*

By FRANK DUDLEY EVANS, Assoc.M.Inst.C.E.

ANYTHING which relates to the health of communities and labour forces is of importance to engineers, but the disease referred to in this Paper, malaria, is of particular interest to them. The effects of malaria are often terrible, and may lead to very high death-rates. Its effect on works in new countries is to greatly increase their first cost and cost of maintenance, and it may lead to their abandonment.

Malaria occurs more or less in all warm climates, and is caused by parasites of the blood which are injected by anopheline mosquities. These mosquitoes first take the parasites from infected man when sucking blood. Thus part of the life of the parasite is spent in man and part in the mosquito. Quinine is the remedy for malaria. No attempts to transmit malaria except through the agency of mosquitoes have been successful.

Mosquitoes are distinguished from other insects by various characteristics, but, like other insects, their life is divided into four stages—the egg, the larva, the pupa, and the imago. The egg is laid on water and develops into the imago, or adult winged insect, in about ten days. Mosquitoes are favoured by certain conditions and diminished by others.

The principal families of mosquitoes that concern man are those belonging to the groups *Culex*, *Stegomyia*, and *Anopheline*.

Some *Culex* mosquitoes carry elephantiasis.

Some *Stegomyia* mosquitoes carry yellow fever.

Some anopheline mosquitoes carry malaria.

Anopheline larvæ and adults may easily be distinguished from *Culex* and *Stegomyia*. They are, as a rule, swamp breeders, hence the long-observed association of marshes with malaria.

The measures to combat and prevent malaria are:—

(1) Destruction of anopheline mosquitoes, either of adults or larvæ.

(2) Protection of man from the bites of infected mosquitoes.

(3) Prevention of mosquito infection by suitable treatment of infected man.

Most malarious countries have applied to some extent one or all of these measures; a few examples of anti-malarial campaigns and their results are given in an Appendix to the Paper.

Quinine may be used as a remedy and a preventive. Screening is effective in keeping mosquitoes away from man under certain conditions. Mosquito larvæ may be killed by oiling or poisoning their breeding-places, or breeding-places, such as water-vessels, may be screened.

The most important method of reducing Anophelines is by drying land by means of thorough drainage. In hill-land subject to heavy rainfall such work presents many novel problems, but has been successfully accomplished in the Federated Malay States at a reasonable cost.

Ravines in the Malay States, unless exceptional, can only be made dry by a continuous drain running completely round the hill-foot, cut on a line at a little above the wet surface level. Open earth or masonry drains are useless for the purpose, and it has been found that the only way to construct permanent hill-foot drains is to use agricultural drain-pipes as subsoil drains, and to provide outlet drains of open masonry or subsoil pipes to carry off their discharge. The pipes are proportioned to run not more than one-quarter full in ordinary dry weather (one-fifth full for drains over 6 in. in diameter). The use of pipe drains less than 4 in. in diameter is not ordinarily advisable, owing to the liability of their choking. The pipes are laid at a depth of 3 ft. to 4 ft. (or even deeper on steep slopes); they have been laid at the heads of ravines on slopes of 1 on 3 with satisfactory results.

Trees must be removed from the vicinity of pipe drains, as their roots may grow into and choke the pipes. Undergrowth and long grass should not be allowed to grow up for the same reason.

* Abstract of a Paper read at the ordinary meeting of the Institution of Civil Engineers on Tuesday, February 9.

Digitized by Google

As economy is all-important in anti-malarial work, it is rarely possible to provide masonry drains large enough to carry all flood-water, and these are, therefore, usually calculated to run one-sixth to one-fifth full in ordinary dry weather, and are surcharged during floods. An inexpensive and thoroughly efficient type of drain has been evolved to meet the conditions, formed of concrete blocks of half-egg shape, laid close but unjointed. The blocks are laid without foundations even on bad ground in flowing water. Should they move out of line or gradient, it is easy to re-set them correctly when the surrounding ground has settled, after which they give no trouble; but re-setting is rarely necessary.

The principal difficulty in draining hill-land lies in maintaining the drained surface undamaged. After some years' experience, it has been found that the most economical method is the use of grass, kept close cut. Small masonry dams are used in rock cuttings, and timber dams are used under certain circumstances. The method to be used depends on the quantity of silt carried by flood-water.

With proper care open drains may be connected to subsoil drains if necessary.

Maintenance of drainage work is most important, as small faults, if neglected, may cause a whole system to be ineffective.

The co-operation of engineering, land and medical authorities is necessary to success in carrying out measures directed against malaria, but engineers can effect much on construction work by giving effect to a few simple rules.

Two important problems in malarious hill countries are those connected with the enormous quantities of silt which are washed off agricultural estates, and mine tailings, which, if not dealt with, may do immense damage and ruin large tracts of country.

VARIETIES.

The Rutherglen Town Council have appointed Mr. J. Gaff Gillespie, architect, Glasgow, to prepare amended plans for the reconstruction of the Town Hall; and Mr. George Sinclair, architect, Glasgow, amended plans for the erection of new buildings at the Old Manse site in Main Street.

The Water Committee of the Aberdeen Town Council recommend that a Bill be promoted in Parliament for a new scheme from the river Dee at a cost of £450,000 for a supply of 10,000,000 gallons daily. The scheme includes a new aqueduct, storage and settling reservoirs, and liming and filtration plant.

The *Board of Trade Journal* states that inquiry is made for the names of United Kingdom manufacturers of brick presses and artificial building stone (reference No. G.W. 1,134). Communications relating to this, quoting the reference number, should be addressed to the Secretary, British Chamber of Commerce, 9 rue des Pyramides, Paris.

In connection with the organisation and extension of the Derby Workhouse and Infirmary, a comprehensive scheme has been submitted for the consideration of the Guardians. Provision is required for 618 inmates of all classes (378 men, 210 women, and 30 children). For the proposed new infirmary, which is estimated to cost £35,000, the Derby Corporation have offered tweve acres of land to the Guardians at £200 an acre, and considering this low figure the committee strongly urge its acceptance.

Dunfermline School Board have decided, in order to meet the growing population in Crossgates, to erect a new school in that village capable of accommodating 640 pupils. The new building will possess several features new to the schools under the Board, including a spray bath, a gymnasium, and medical inspection rooms. The Board have also committed themselves to the principle of providing a temporary building for the teaching of mental defectives.

The Three Towns branch of the Devon and Exeter Agricultural Society have written to the Plymouth Borough Council, stating that, having regard to the extension of the borough and the great probability of general works of a public character to be entered upon, the members asked the Council to consider the desirability of engaging the services of the several architects now practising in the borough, and for that purpose suggested that the principle of a selection by rota be observed as far as possible.

The Dublin Municipal Council, at its last meeting, adopted reports of the Housing Committee, recommending: (*a*) The acceptance of the tender of Messrs. Alexander Fraser & Co., of this city, amounting to £28,480, for the erection of 146 dwellings (divided into two-room and three-room) on the Beresford Street and Church Street area. (*b*) The acceptance of the tender of the same firm, amounting to £15,352, for the erection of sixteen two-room tenements in Luke Street, thirty-two two-room tenements in Moss Street, and twenty-eight three-room cottages in Maguinness Place, all situated in the Trinity Ward.

At the Manchester Town Hall last week Mr. P. M. Crosthwaite held an inquiry for the Local Government Board respecting the City Council's application for sanction to borrow £60,000 for works of sewerage in the city area, and £1,775 for the purchase of property in the township of Flixton adjoining the Davyhulme sewage disposal works. With reference to the application for leave to borrow £60,000, Mr. T. de Courcy Meade, city surveyor, was the only witness. The money was needed, he said, for new sewers at East Didsbury, Princess Road, Mauldeth Road to Moseley Road, and for the drainage of Millgate Lane and Stenner Lane.

Mr. W. M. Cross, M.Inst.C.E., one of the Inspectors of the Local Government Board, held an inquiry at Nottingham last week into an application by the Notts County Council to borrow about £122,000, made up as follows: Additions to County Lunatic Asylum, £30,000; police station accommodation, £8,000; additional buildings, Ransom Sanatorium, £2,000; additional Road Board loans, £28,500; institution for mental defectives, £40,000; emergency works (workmen's cottages, improvements for highways, &c.), £5,000; Kingston Agricultural College, £4,000; isolation hospitals, £5,000.

Official notice has been given in the Private Bill of the House of Commons that it is not the intention of the London County Council to proceed any further this Session with their Bill to establish an electricity authority for London and the surrounding districts. The only Bill dealing with this subject now before Parliament is one promoted by the majority of the electricity companies in London. Notice has already been given in the House of Commons by Sir Edwin Cornwall, on behalf of the London County Council, to move the rejection of this Bill on the motion for its second reading.

A sessional meeting of the Royal Sanitary Institute will be held in the Municipal School of Technology, Manchester, on Friday, February 19, when discussions will take place on "The Construction of Sewers" (illustrated by lantern slides), to be opened by Mr. S. S. Platt, M.Inst.C.E. (borough surveyor, Rochdale), and "Housing from a Sanitary Inspector's Standpoint," to be opened by Mr. H. Dryland (Sanitary Department, Manchester). The chair will be taken at 7 p.m. by Sir Henry Tanner, C.B., I.S.O., F.R.I.B.A. (Chairman of Council). On Saturday, February 20, an inspection will be made of a portion of the new main drainage scheme of the city.

A duplicate of the statue of Lord Roberts, by the late Mr. Harry Bates, A.R.A., which is in the Maidan at Calcutta, is to be erected in Glasgow on a site not yet selected. The equestrian figure is 11 ft. 6 in. high, and stands on a pedestal 18 ft. 6 in. The lower part of the pedestal is formed of a base with columns, panels, and inscriptions, flanked at one end by a bronze figure in ancient and decorative armour representing "War," and at the other end by a female figure representing "Victory" seated on the prow of the ship of State. The frieze at the top of the pedestal shows the various branches of the Army with which the late Lord Roberts was connected.

The Dean and Chapter of St. Paul's have lent to the Geffrye Museum, Shoreditch, forty-one objects of artistic and antiquarian interest. They are for the most part woodwork and ironwork placed in the Cathedral in the time of Sir Christopher Wren, but subsequently removed from their original positions in the course of alterations from time to time. There are many fine specimens of wood carving, some of which are from the hand of Grinling Gibbons. An interesting series of carved oak mouldings is exhibited in such a way that sectional drawings may be taken of them by students. The woodwork includes a prayer desk, a door with a wrought-iron panel, an overdoor, stall brackets, trusses, and an oak capital, all beautifully carved. Scarcely less interesting are the specimens of wrought iron, including as they do some choice examples of Tijou's work. It is to be hoped, says the *City Press*, that the Dean and Chapter will allow these loans to remain on public view for a considerable time, if not permanently, in preference to stowing them out of sight in the crypt of the cathedral.

FORTHCOMING EVENTS.

Monday, March 1.

Royal Institute of British Architects : Special and Business Meetings, Election of Royal Gold Medallist, at 8 P.M.

Tuesday, March 2.

Society for the Promotion of Roman Studies : Papers entitled "The Production of Samian Ware and its Development" and "A Note on a Visor Helmet from Nijmegen, Holland," by Mr. James Curle, F.S.A., at 4.30 P.M.

Wednesday, March 3.

Royal Archæological Institute : Paper entitled "The Sciapus and other Abnormal Human Forms in English Church Carvings," by Mr. G. C. Druce, F.S.A., at 4.30 P.M.

Carpenters' Hall : Paper entitled "Chelsea Antiquities," by Mr. Walter H. Godfrey, at 7.45 P.M.

Thursday, March 4.

London University : Lecture entitled "Architecture in Belgium since 1840," by R. M. Victor Horta (director of the Academy of Fine Arts, Brussels), at 5.30 P.M.

Concrete Institute : Paper entitled "Some Notes on Wind Pressure," by Mr. R. Graham Keevill, at 7.30 P.M.

SLIGO ABBEY.

THE annual reports of the Commissioners of Public Works in Ireland usually contain interesting descriptions of ancient monuments remarkable, not only for their archæological importance, but for their architecture. In the latest issue we find an excellent account of Sligo Abbey, which was founded in 1252 for Dominican Friars by Maurice Fitzgerald, son of Gerald, first Baron of Offaly, who was the first to bring the Dominican Franciscan Orders to Ireland. The *Annals of Loch Cè* give the date of its erection as 1253. Among the dates of importance in the history of the Abbey are 1360 A.D., when it and the town were built by MacWilliam Boucher; 1414 A.D., when they were again accidentally burned down; and 1416 A.D., when the Abbey was rebuilt by Friar Bryan MacDonogh, son of Dermod MacDonogh, tanist of Tirerrill and Collooney, with assistance from Pope John XXIII., who granted indulgences to all who contributed to its restoration.

Much damage was done to the building in 1595, when George Bingham, brother of the President of Connaught, took possession of the Abbey while besieging the neighbouring castle, and used much of its woodwork in making engines for the siege. During the wars of the sixteenth century the Abbey was often occupied and fortified. In the disturbance of 1641 the town of Sligo was burned by Sir Frederick Hamilton, and it is said the Abbey was at the same time burned, together with the friars who had returned to it, two of them who tried to escape being killed by the soldiers.

The church consists of nave with side aisle and south chapel or transept, and choir separated from the nave by a rood screen and tower. The west wall of the nave is non-existent, but the dimensions of this part of the church appear to have been 74 ft. 8 in. by 21 ft. 6 in. The south aisle was 50 ft. by 13 ft.; the transept 33 ft. 10 in. by 21 ft. The choir appears to have been originally 60 ft. 3 in. in length by 21 ft. 4 in. in breadth internally but the tower, which seems to have been a later insertion, reduced the length of the choir to 44 ft. The plan, therefore, is of typical Irish character, and, of course, has a square east end. North of the chancel was a vaulted sacristy with a room over.

The choir, sacristy, and a portion of the chapter-house—which, with the cloister and abbey buildings, is to the north of the church—are the oldest portions now existing. From the dates given above one might suppose that the detail would be of later character than is the case. The south wall of the choir is pierced by eight lancet windows, 1 ft. 5½ in. in width and 14 ft. in height widely splayed internally and separated by broad piers. They are, therefore, of much earlier type than one would expect to find in England in 1253. Still more remarkable is the east window. Of this we are told that "the original east window was a triplet, the lights of which were similar to the lancets in the south wall; these were removed about the end of the fifteenth century, and a moulded window of four lights with geometrical tracery was substituted." The drawing of the substituted window shows a perfect reticulated-tracery head of the type that may, in England, be put down invariably as very close in date to 1325, and it is difficult to understand that even in Ireland such a window should have been inserted so late as "about the end of the fifteenth century." One would suppose that the writer of the article had allowed his judgment to be warped by the date of the rebuilding by Friar Bryan MacDonogh, but we should feel inclined to attribute this window to some unrecorded work of restoration between the burnings of 1360 and 1414, even if not before that of 1360. It is scarcely likely that even if this latter catastrophe, and that of 1414, spared the original triplets, they would have remained until the end of the fifteenth century before a reticulated tracery window was substituted. The only justification for the assignment of this date is the character of the nook-shafts to the rear-arch, and these might very likely be a late fifteenth-century restoration of those damaged by the fire of 1414. We should be prepared to allow that the rear-arch itself belongs also to this late date.

The north wall of the nave is pierced by three windows, each of two pointed lights 9 ft. 1 in. in height and 1 ft. 4 in. in width, coupled together with chamfered jambs and mullions. These, though later in date, no doubt, than the chancel lancets, were, we think, part of the church commenced in 1253, and not new features introduced after the fire of 1360 or that of 1414. The arcade in the south wall of the nave is one of three lofty arches, 12 feet in span, opening into the side aisle and transept. The arches are pointed, of "Decorated" form, and have inner and outer ribs chamfered on both sides. The piers are 12 ft. in height and 4 ft. 5 in. by 2 ft. 11 in., with moulded capitals. The character of these arches and piers clearly indicate that the aisle was a fourteenth-century addition, either before or shortly after the burning of 1360. Of the transept few particulars are given, but from those supplied we should believe that this was part of the work of Friar Bryan MacDonogh.

One of the most interesting features of the church is the inserted tower, which was erected without disturbing the walls of the choir, and has a breadth of only 14 ft. 3 in., supported on a choir arch of 15 ft. 4 in. span, so that the side walls of the tower rest entirely on the

Digitized by Google

haunches of the choir arch. From the detail given we are inclined to attribute the tower to Friar Bryan MacDonogh.

Another highly interesting feature of the church is the stone rood-loft, of which only small portions remain, from which a "restoration" on paper, sufficiently probable, shows it to have been carried on an arcade of three arches. The detail of the remains indicate that the rood screen was an introduction made after the restoration of the damage caused by the fire of 1360, on the assumption that all the detail of the church is of later date than would be found in England at the same period. Otherwise it must be regarded as anterior to 1360.

The stone altar, we are told, has been re-erected from the original stones, and is of unusual size—11 ft. 9 in. in length, 4 ft. 4 in. in breadth, and 3 ft. 3 in. in height. The front is highly carved, its length being divided into nine panels, with cusped ogee heads and foliage carving of the fifteenth century; in one panel a rose is carved, and in another bunches of grapes. The altar table is formed of five slabs, one of which is an insertion. The remaining four exhibit a cross and an inscription, one word of which is on each stone. The words remaining are "Me. Iohan. Fieri. Fecit." It is suggested that the missing stone probably bore the surname of the donor of the altar.

Of the domestic buildings of the Abbey there are only fragments. They show that the cloister garth was almost square, the dimensions being 50 ft. from north to south, and 42 ft. 6 in. from east to west. The refectory was situated on the upper floor, and the place for the reader's pulpit may be seen over the northern cloister arcade.

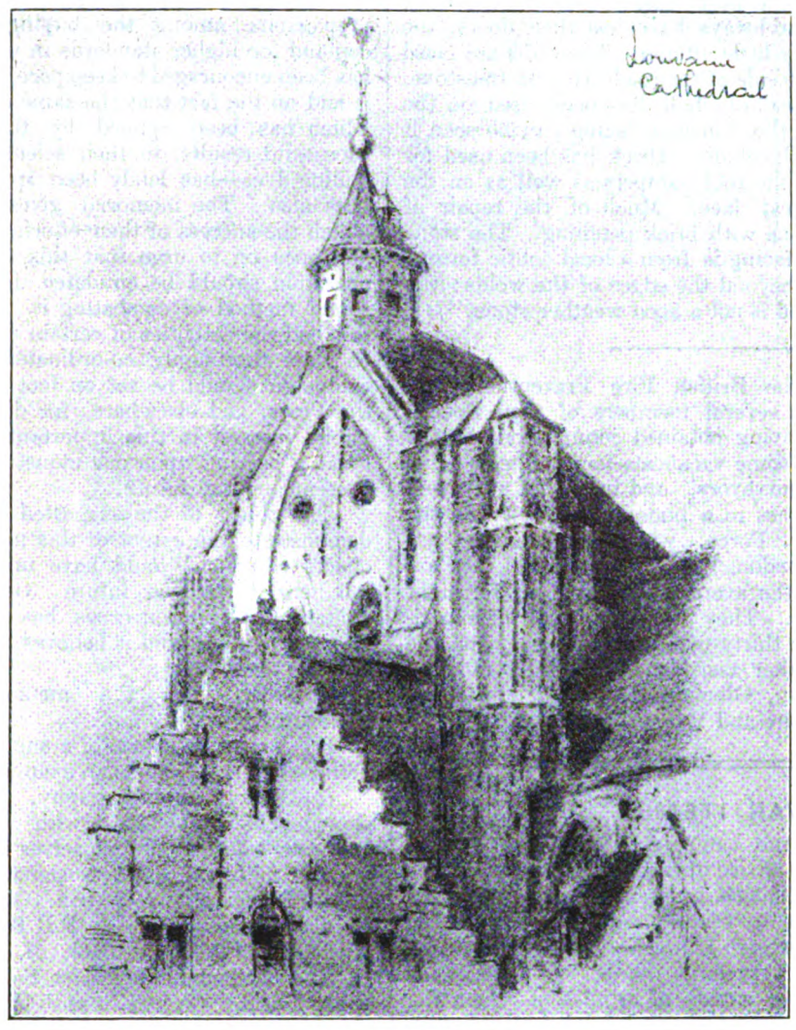
There are a number of monuments and memorial stones exhibiting a great variety of style and period, some of the carving being of great excellence in design and execution. Many shafts, capitals, and arch stones have been rescued from the rubbish that had accumulated. Repairs, or rather preservative works, have been carried out during the past year; these include principally the removal of ivy and elder bushes from the walls, the clearing away of rubbish, and the re-pointing to joints and exposed tops of walls.

NOTES AND COMMENTS.

Naturally we are specially interested in this winter's Special Number of *The Studio*, which is entitled "Sketches by Samuel Prout in France, Belgium, Germany, Italy, and Switzerland," and contains reproductions of drawings that we have included in our own portfolio of "Continental Sketches by Samuel Prout." We also naturally prefer our own reproductions, which are of the full size of Prout's drawings, to the reductions given by *The Studio*, and certainly feel that the *timbre* of Prout's work is more adequately expressed by the larger scale lithographs. The winter number contains an excellent biographical and critical monograph of the life and art of Samuel Prout, by Ernest G. Halton.

The history of the scheme for establishing in Great Britain the manufacture of dyes, which British industries use annually to the value of nearly two and a quarter millions sterling, of which about one and three-quarter millions used to come from Germany, is illustrative of the chief difficulty that British manufacturers and merchants feel in attempting to capture enemy trade. This difficulty is that the circumstances which enabled the enemy countries to obtain so large a proportion of our trade before the war will be revived after peace is restored. Our manufacturers are loth to invest capital in plant and other expenses necessary to capture trade so long as they feel that when peace arrives that capital will have been sunk to no further purpose, and they also are confident that the war will not last long enough to enable them to recoup the capital sunk. The Tariff Commission has obtained a volume of evidence which points unmistakably to the conclusion that the dye industry must be protected in some way against foreign competition before the necessary capital will be forthcoming.

We are somewhat amused at the claim for novelty put forward in a contemporary for the use of brick in the mullions of tracery for the windows of a suburban church recently erected in Essex. The existence of such work five hundred years and more old, in Pomerania, ought to be known to every architectural student, not to speak of the by no means few examples to be found nearer home, even in the county of Essex. For instance, at St. Osyth, near Clacton, the nave piers with their caps and bases are in moulded, as distinguished from cut, brick.



In the United States it is no uncommon thing for reinforced concrete buildings to come down with a crash before they are completed, but, happily, in this country such occurrences are rare. Therefore the collapse of an addition to paper mills at Bury is a notable exception, and we hope the cause will be made indubitably clear in the course of the coroner's inquiry.

The law and practice as regards ecclesiastical dilapidations has worked, on the whole, fairly smoothly, though with undoubted cases of individual hardship. Revision is proposed in the Bill drafted by Queen Anne's Bounty, but this, more particularly in altered circumstances, brought about by the consolidation of Diocesan Boards of Finance, is open to criticism, some of the most vital of which was voiced by the Archdeacon of Ely in the Lower House of the Convocation of Canterbury.

There had been in the past, he said, considerable doubt among members of the House as to the lines upon which they ought to move. There had now, however, come to be a general consensus of opinion on three principles, all of which might be in themselves criticised. They were compulsory surveys, annual payments towards dilapidations, and the payment of surveyors by salary and not by fee. The Archdeacon expressed his sense of the debt of gratitude which Churchmen owed to surveyors for the work they had done for the Church for many years past. What was the machinery which was to bring into effect the principles agreed upon? Ten years ago there was no sort of machinery for the purpose, but in the Bill which had been drafted by Queen Anne's Bounty a new machinery had been created, consisting of a central authority with local Advisory Boards, and this new machinery was to be set up, it was proposed, all over England, without any very careful regard to diocesan divisions. The local Advisory Boards need not be diocesan, and the range from which the inspectors were appointed might include the areas of one or more dioceses or parts of dioceses. The rearrangement of the areas of inspection would be made in accordance with what the central authority found the most suitable for carrying on the work. Since the scheme was drafted an enormous change in ecclesiastical organisation had come about. There were Boards of Finance in every diocese, and it appeared to him that there would be a certain inconvenience in creating new local advisory bodies instead of giving the work to the present Board of Finance. They did not want to have so much new machinery as was indicated in the draft Bill. There was a good case for reconsideration, and the Joint Committee of the two Provinces, which had the matter in hand, determined that it was desirable at the present juncture to report progress and give an opportunity for reconsideration as to the mode of bringing the principles into effect. He urged that over-centralisation should be avoided, and expressed the belief that the machinery of the Bill would not work well, but with slight changes could be made to work as well as most machines did.

The Lords Feoffees of the Manor of Bridlington have been forced to take into consideration the question of the preservation of the historic old Bayle Gate, which stands near to the Priory Church. Mr. John Bilson,

Digitized by Google

LOUVAIN CATHEDRAL.
From a Sketch by Mr. HUON A. MATEAR, F.R.I.B.A.

F.S.A., F.R.I.B.A., has reported on the work to the lords, and in his statement there is the following interesting historic sketch of the structure:—

"In 1388 a licence was granted by King Richard II. to the Prior and Convent of Bridlington to surround the Priory with walls and houses of stone and chalk, and to fortify and crenellate such walls and houses. The Bayle Gate was evidently built as part of this scheme of enclosure and defence, and it is, therefore, nearly contemporary with the sister house of Austin Canons at Thornton in Lincolnshire, the licence to crenellate the latter being granted in 1382. The survey of the Priory buildings, made immediately after the dissolution of the monastery by Henry VIII., contains the following description of the Bayle Gate:—

"'At the coming in of the same Priory is a Gatehouse four square of tower fashion, builded with freestone and well covered with lead. And on the south side of the same Gatehouse is a Porter's Lodge with a chimney, a round stair leading up to a high chamber, wherein the three weeks' Court is always kept, with a chimney in the same, and between the stair foot and the same high chamber where the Court is kept be two proper chambers, one above the other, with chimneys. In the north side of the same Gatehouse is there a Prison for Offenders within the Town called the Kydcott. And in the same North side is a like pair of stairs leading up to one high chamber, and in the same Tower with a chimney mem. that all the windows of the said Tower be clearly without glass.'

"In spite of some alterations of more recent times, the Gatehouse still remains substantially as it is described in this survey. The building measures externally about 55 feet from north to south, by 31 feet from east to west. Through the middle of it is the roadway, 23 feet square internally covered with a groined vault. This passage is approached from the west (towards the town) through two archways, a wide one on the south side with a narrower one for foot passengers on the north. Eastward (towards the Priory) there is one wide archway. On each side of the central passage are the two small chambers mentioned in the survey, of three storeys in height below the top floor. Access to these was given by newel staircases, one on each side on the east face, approached by doorways in the side walls of the passage way at their east end, which staircases, or traces of them, still remain. Over all is the High Chamber or Court Room, which occupies the whole of the upper storey. An almost flat roof covers the whole.

"The walls are strengthened by buttresses on each side of each of the four angles, with further buttresses flanking the archways on the east and west faces. The lines of the north and south walls are broken by slight projections externally for the fireplaces, and at the eastern end of the south wall is a projection arched below for the garderobe shoots. The upper part of the west face seems to have undergone some reconstruction, and is now plastered, apparently on brickwork. The date of 1797 on the heads of the rainwater pipes may perhaps indicate the period of this reconstruction.

"The south side has undergone more recent and somewhat drastic renewal, and the windows of the high chamber have been renewed. Internally this high chamber has been modernised, and it is now approached by a

Digitized by Google

modern staircase in the north-east corner. Otherwise, and except that the archways have lost their doors, the building has been very little altered. The walls are faced externally and on each side of the roadway with freestone, except that a good deal of chalk has been used on the north side. Where the internal facing can be seen it seems to be principally chalk. Brick has been used for the reconstruction of the roof parapets as well as on the upper part of the west face. Much of the repair of masonry has been done with brick patching. The stone used for the external facing is from a local oolitic formation which crops out beyond the edges of the wolds; it is loosely compacted, and is not a good weather stone."

We learn from the British Fire Prevention Committee that, owing to several members of their Special Fire Survey Force having obtained commissions in the Army, there are now some vacancies for architects, civil engineers, building surveyors, and insurance surveyors who are prepared to act in a honorary capacity on the Special Fire Survey Force, whose headquarters are 8 Waterloo Place, London, S.W. Professional men are required to give, on the average, one day per fortnight (generally Saturdays). They should be men of experience, preferably over thirty-five years of age, and the districts in which further assistance is specially required are Cornwall, Durham, Gloucestershire, Somersetshire, Warwickshire, Wiltshire and Worcestershire.

WAR ITEMS.

In connection with the campaign undertaken by the Board of Trade on the advice of their Advisory Committee on Commercial Intelligence to assist British manufacturers and merchants to secure trade formerly in the hands of German or Austro-Hungarian firms, the Board continue to receive a very large number of inquiries for the names of sellers or buyers of articles of which the sources of supply or markets have been interfered with by the war.

Special arrangements have been made in the Commercial Intelligence Branch of the Board of Trade for dealing with these inquiries, and List 8*b* of articles which inquirers desire to purchase is now ready and may be obtained by United Kingdom manufacturers and traders.

British firms interested, as suppliers, in any of the goods mentioned should communicate with the Director of the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C.

A memorial, signed as under, and containing suggestions for a counter-attack upon German art industries, has been presented to Sir Hubert Llewellyn Smith, Permanent Secretary to the Board of Trade.

The committee responsible for the memorial, consisting of workers in various industries affected by German competition, were received at the offices of the Board of Trade by Sir Hubert Llewellyn Smith, Sir Lewis Selby-Bigge (Permanent Secretary to the Board of Education) being also present. They were invited, as an initial step, to submit a collection of enemy products, which they have got together, with a view to an exhibition being held under the auspices of the Board of Trade.

The memorial points out that the remarkable expansion of German trade, achieved largely at the expense of our own, has resulted not simply from the energetic exploitation of fresh markets, but also in a striking degree from the untiring efforts which the Germans have made to improve the quality of their work. During recent years the intelligent co-operation of artists, educationists and manufacturers (assisted by such organisations as the Deutsche Werkbund), with the object of freeing their products from the stigma of "cheap and nasty," has resulted in a marked improvement in the higher grades of German manufactures.

Side by side with this, there has been a widespread propaganda among the buying public, whereby the demand for higher standards in workmanship and design has been encouraged to keep pace with the supply. Stress is laid on the fact that the same educational co-operation which has been applied by the Germans, with such successful results, to their scientific manufactures—*e g.* aniline dyes—has lately been applied to their art industries also. The memorial gives instances of trades in which the success of their efforts has been most marked, and goes on to urge that this far-seeing policy of co-operation should be emulated in England as the only sound method of combating it. It is suggested that to this end the activities of certain public authorities should be more thoroughly co-ordinated, and that a vigorous campaign should be set on foot through the medium of the Press, and elsewhere, for directing and stimulating public interest in this important matter, which has so great a bearing upon our industrial welfare, both in the present and the future.

The object of the suggested exhibition would be to demonstrate the extent of this new German rivalry, the effects of which would have made themselves severely felt here in the near future. Germany herself, by precipitating the present crisis, has given us a respite from this competition, and it behoves us to take advantage of it while we may.

Together with the memorial were sent two enclosures:—

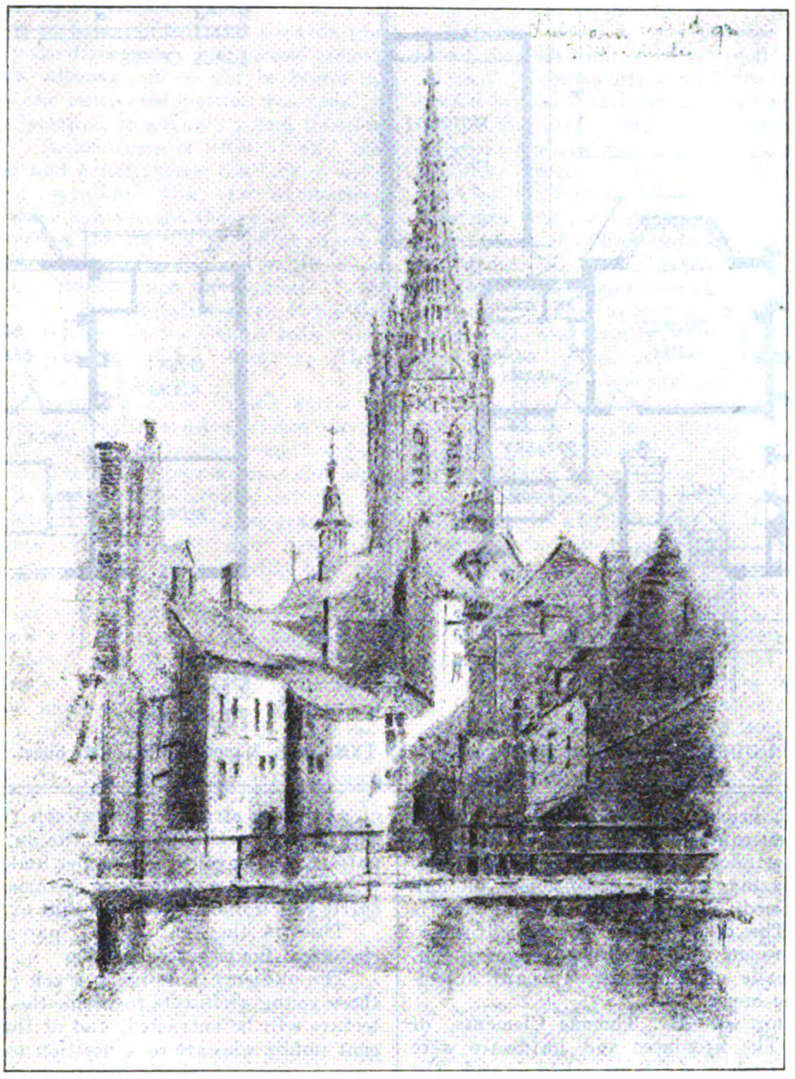
(*a*) A short synopsis of a suggested campaign, taking pottery and porcelain as an example;

(*b*) A note on lithography, prepared by an expert, showing the completeness with which the Germans have been able to establish themselves in the English market.

The following are the signatories:—Lord Aberconway, Sir Kenneth Anderson (Orient Line Steamships), Frank Brangwyn, R.A., P.R.B.A., Fred. V. Burridge (Principal, Central School of Arts and Crafts), B. Fletcher (Principal, Leicester School of Art), C. H. St. John Hornby (W. H. Smith & Son), John Marshall (Marshall & Snelgrove), H. E. Morgan (Controller, W. H. Smith & Son), James Morton ("Sundour Fabrics," Carlisle), Frank Pick (Underground Electric Railways), H. Gordon Selfridge (Selfridge and Company, Limited), Frank Warner and Sons (Silk Weavers), H. G. Wells (author).

Committee.—Ambrose Heal, F. Ernest Jackson, J. H. Mason, H. H. Peach, Hamilton T. Smith, Harold Stabler.

Hon. Secretary.—Cecil C. Brewer, 6 Queen Square, Bloomsbury, W.C.



R.I.B.A. EXAMINATIONS.

The Board of Architectural Education announce that the designs submitted by the following Students who are qualifying for the Final Examination have been approved:

***Subject xviii.*: (*a*) Design for an organ-case in a circular hall: Foot, A. A.; Gordon, P. J.; Hull, V.; Knight, W. G.; Lawson, J. Scott; Sanders, T. A.; Tebbutt, H. J. (*b*) Design for a group of small dwellings for twelve aged couples: Brown, W. J.; Cash, H. W.; Filkins, E. W.; Gordon, P. J.; Hall, R. B.; Holden, W.; Jackson, R.; Kassem, H. Z.; Keep, N.; Knight, S.; Luyken, H. M.; Lyne, E., jun.; Medd, H. A. N.; Minns, S. E.; Mitchell, C. H.; Moss, D. J.; Philp, A. T.; Picton, C. S.; Routley, L. J.; Saxon, F. C.; Taylor, M. B.; Thomas, D. R.; Whitehead, P.; Wilkinson, F. Designs for other subjects, from the following candidates, have also been approved: Ap Gruffydd, C. O.; Fisher, H. N.; Gray, G. H.; Moore, R. S.; Wood, A. G.**

The Royal Academy give notice, in connection with the forthcoming exhibition, that the day for receiving architectural drawings, engravings, black and white drawings, miniatures, pastels, and water-colours is Friday, March 26. Not more than three works may be sent by one artist.

CHURCH OF ST. GERTRUDE, LOUVAIN.
From a Sketch by Mr. HUON A. MATEAR, F.R.I.B.A.

COMPETITION NEWS.

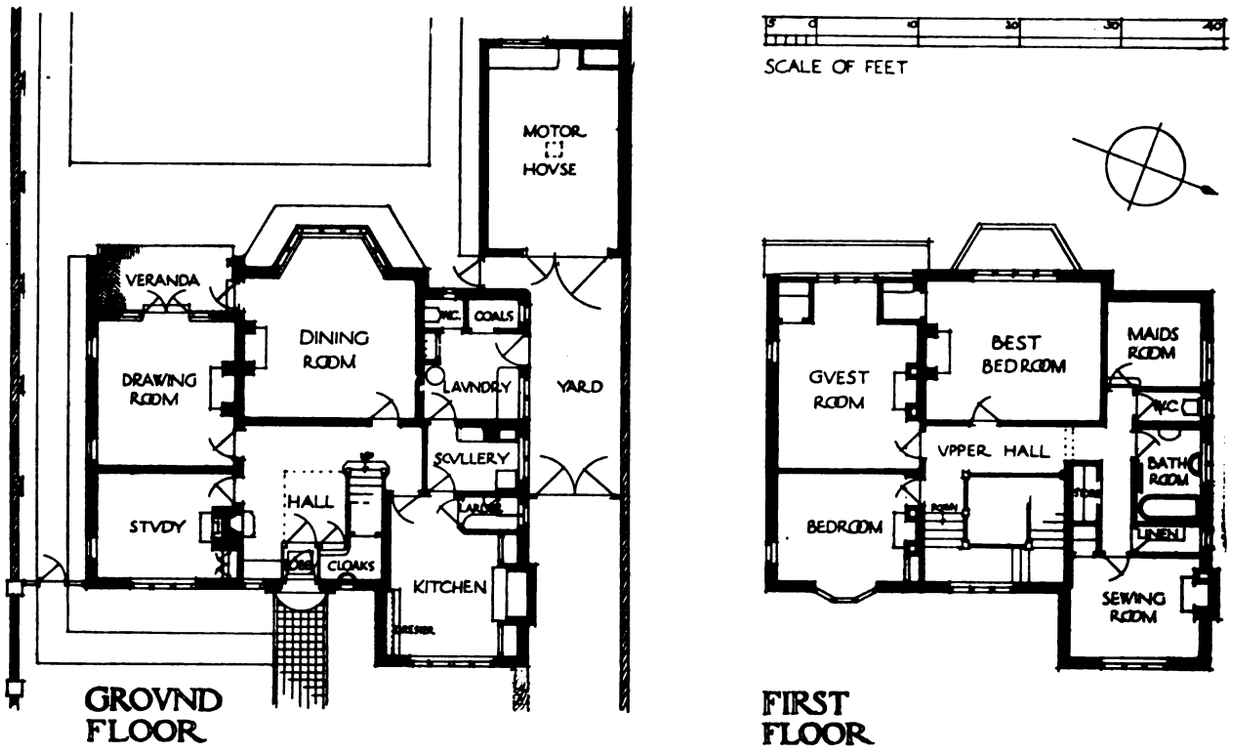
GOUROCK.—Mr. A. N. Paterson, M.A., F.R.I.B.A., of Glasgow, has been placed first in a limited competition for extensions to the Town Hall. Sir John J. Burnet was the assessor. The cost is estimated at £8,000.

MACCLESFIELD.—The Macclesfield Lands, Railways, and Town Development Committee have considered the plans submitted by eleven competitors for three prizes offered by the Committee for houses to be built at a cost not exceeding £180. Twelve sets of plans were sent in, but several were for houses exceeding the £180 limit, and only five were considered. The first place was awarded to Messrs. H. K. Rostron & Co., 21 Jordan Gate, but before the successful competitors can receive the prize of £15 15s. they are required under the terms of the competition to find a builder who will erect a house to their plans and specifications for £180. The borough surveyor (Mr. S. C. Baggott) acted as assessor in the competition.

SOUTHEND.—The award has just been made known in the recent competition for the new housing scheme at Ruskin Avenue, Southend-on-Sea, for the Southend-on-Sea Corporation, the design submitted by Mr. Percy G. Hayward, M.S.A., of 4 Broad Street Buildings, Liverpool Street, E.C., and Queen's House, Hamlet Court Road, Westcliff-on-Sea, being awarded the first premium. Mr. Percy Brockbank, of County Chambers, Southend-on-Sea, was placed second.

SHIPLEY.—New public offices are to be erected by the Urban District Council on the site of the old Manor House from plans prepared by Messrs. Anderton & Bailey, architects, Shipley and Keighley, and selected in open competition. Fifty-five designs were sent in which were adjudicated upon by the assessor, Mr. F. E. P. Edwards (architect to the Sheffield Corporation), who awarded the first premium of £100 to Messrs. Anderton & Bailey.

ILLUSTRATIONS.



DEVONPORT MUNICIPAL BUILDINGS COMPETITION.

IN preparing this design the authors (Messrs. Leslie Wilkinson & Alan Binning, AA.R.I.B.A.) were influenced by the fine and unusual situation of the irregular and steeply sloping site, a vast open space extending in front to Mount Wise and the sea and flanked by the Raglan Barracks and other naval and military establishments. As to the composition, the great dominating mass of the Guildhall and Courts would serve to unify the whole, with its front office blocks surrounding the Council Chamber as the central feature. The police and fire stations, with exercising yards, &c., were planned on the rear portion of the site, with good road access. The materials proposed were local limestone walling, with grey granite dressings in this and the general design, carrying on the fine local traditional work of the early part of last century and accounting for a certain breadth of treatment and largeness of scale.

HOUSE AT FENHAM, NEWCASTLE-ON-TYNE.

THIS house has been erected for Mr. I. Turner, and stands on a site of 60 feet frontage. The walls are faced with 2½ inch Harrogate sand-faced bricks pointed in white mortar, with thin Prudham stone window sills. The roof is covered with Rosemary tiles. A special feature is made of the hall, with its open staircase and Austrian oak panelling and floor. The floor of the entrance lobby and front steps are of white Sicilian marble. The ceilings of the drawing and dining rooms are enriched with "Stuccolin" decoration, while that of the best bedroom is coved. The walls of the scullery are faced with white glazed bricks, and the bathroom and w.c. have tiled dadoes. The floor of the

Digitized by Google

HOUSE AT FENHAM, NEWCASTLE-ON-TYNE.—Mr. Marcus K. Glass, Architect.

verandah is paved with brick on edge, laid herring-bone pattern, and the main entrance path with 9-inch red Staffordshire squares. All window casements throughout have diamond pattern lead glazing, with the exception of the hall window, in which stained glass treated heraldically is sparingly introduced. The door and window furniture in the hall and reception rooms are of oxidised silver finish. A special point was made of adequate cupboard accommodation throughout the house.

The general contractor was Mr. Thomas Clements, of Jesmond, Newcastle. The fireplaces and hardware were supplied by Messrs. Emley & Sons, Ltd., and the electric light fittings by Messrs. Verity, Ltd. The architect is Mr. Marcus K. Glass, M.S.A.

THE ARCHITECTURAL ASSOCIATION.

An ordinary general meeting of the Architectural Association was held on Monday, the 22nd inst., at Tufton Street, Mr. H. Austen Hall, acting President, in the chair.

It was announced that the ordinary general meeting arranged for March 22 has been postponed to Tuesday, March 30, as Mr. Hilaire Belloc finds himself unable to be present on the former date. Mr. Belloc's paper, to be read on March 30, at 8 p.m., is entitled "The Changes in the Conception of Artificial Permanent Defence, including those indicated by the Present Campaign," and will be illustrated by lantern slides.

The nomination by the Council of the following offices for Session 1915-1916 was duly approved:

House List.

President: Mr. H. Austen Hall. *Vice-Presidents*: Mr. Stanley Hamp and Mr. F. Winton Newman. *Hon. Treasurer*: Mr. E. Stanley Hall. *Hon. Secretary*: Mr. H. M. Fletcher. *Hon. Editor "A.A. Journal"*: Mr. F. C. Eden. *Hon. Librarian*: Mr. V. T. Hodgson. *Ordinary Members of Council*: *Past President*: Mr. Maurice E. Webb, Mr. C. C. Brewer, Mr. H. Farquharson, Mr. Ralph Knott, Mr. A. G. R. Mackenzie, Mr. E. Brantwood Maufe, Mr. W. G. Newton, Mr. W. J. Palmer-Jones, Mr. J. Alan Slater, Mr. T. Tyrwhitt, and Mr. Philip E. Webb.

Mr. A. E. Richardson then read the following paper entitled

The Architectural Spirit of the Age.

Few things reveal the character of nations in a truer light than the circumstance of war. For the contrast to normal conditions throws into strong relief the temperament of a people and demands an introspective mood. Such a time is the present; the leading nations are gripped in the throes of a titanic struggle; henceforth the whole complexion of things will be changed, and the outlook of individuals and nations will broaden to a deeper understanding of life. War is beneficial to a nation; it invariably brings a chastening spirit which finds its most cogent expression in architecture.

This is the text of my paper, the sermon and the rhetorical flourishes will follow.

The audience I desire to reach consists of two parts: of those young architects to whom the future of English architecture will be entrusted, and of that portion of the intelligent public who are in a position to exercise patronage and appreciation. I shall endeavour to express the truths I have gleaned from a study of modern architecture and to indicate sources of inspiration which, although familiarly known, are not appraised at their true value. It is essential that we as English architects should emancipate ourselves from the cloying influence of insular apathy, enjoy an enlarged vision of architectural achievement in other countries, and to profit by the experience.

The travelled section of the public has a disinterested view of modern architecture and therefore is in a position to voice its likes and dislikes. It is, notwithstanding, bewildered by the jargon of opposing schools; it cheers to the echo newspaper controversy and endeavours to believe in the latest resuscitation of some threadbare style. In despair it turns to pure reproduction and continues to live in buildings of familiar aspect. But all the time there is a sense of keen disappointment that the new building does not equal the old work either in spaciousness or simplicity, and, despite the expense, does not approach the excellence of some dimly remembered foreign structure.

Recent years, however, have witnessed remarkable earnestness among the younger members of the profession, and we have seen the development of architectural schools whose work sufficiently testifies to the serious purpose of the students. This is a sign auguring well for the future; its immediate results are discernible in the streets of our cities. From the foregoing it is reasonable to argue that the future development of architecture in this country on academic lines is dependable on two primary factors.

First, the education of architects; this must be consistently undertaken to fit them for the position of arbiters of taste. They will then be the better equipped to guide the public, and above the temptation of pandering to the passing fashion. Secondly, the public must be encouraged to an understanding of what organic architecture means, and weaned from the lures of the house decorator and the furniture dealer.

The eighteenth century affords an instance of the attitude of patrons and architects. In the early period the patrons educated the architects and directed the mode; the latter,

Digitized by Google

however, were not content to be exploited, and towards the second half of the century the directorship had passed almost entirely to the architects, although it should be borne in mind that in those days the cultivated patron was usually a man of taste and in a position to advance sound theories for the artists to accept. To-day there is little, if any, co-operation between patron and artist, hence the lack of confidence, the warring of opinions, and the numberless innovations, all of which are against the theory of the art. The nineteenth century was in the main a period of experiment during which the strength of the Classic tradition as developed from the Italian Renaissance was proved. I do not refer to the tradition in Great Britain, which is purely local, but to the broader acceptance of the Classic spirit and its manifestations on the Continent and in America. This is the subject for which I make my appeal.

From an architectural standpoint the Classic spirit is what we are all striving for; it implies a disinterested search for the ideal; it means the delight in reticence and perfection; moreover, it is the reverence for permanence and continuity. It demands of a work of architecture, not that it shall be clever and original, but that it shall be grand and noble. It forswears loose individuality and hysterical emotion and seeks to express trained individuality and restrained feeling.

The Classic spirit is animating and real; it continually looks for the intrinsic and will not countenance the casual. It is akin to the monumental and the eternal and rejects the instantaneous, however brilliant. It is indivisible from tradition, in which it is steeped and revels. When the Classic spirit inheres in a work of architecture it forces one subjectively to recall the whole atmosphere of beauty belonging to the works of antiquity; it brings to the mind visions of form and composition, faintly remembered, and we discern the old truths appearing anew as the chief attributes of the building we are studying. A clear interpretation of the Classic spirit means a return to the sheer joyousness of living; it does not mean that we are to deny either originality or personality to our architecture; these are among the essentials, they are inevitable, and are encouraged by the conditions of the problem. But we should endeavour that our new buildings in all the dignity of their truth present anew the old spirit seen from a modern standpoint and adjusted to our own age.

The eclectic tendencies of the last century which were directed to the exploitation of historical motifs are now undergoing a further extension owing to the advance of our point of view. Formerly it was the practice to adhere to certain recognised sources of inspiration, such as Greek, Roman, and Italian, with a friendly eye on contemporary France. Parallel to this procedure there rapidly developed a tendency to resuscitate the picturesque and romantic buildings of our insular history culminating in a series of indecisive revivals. We are just recovering from this outburst of misapplied activity, and, although in amateur quarters opposition is offered, the neo-Classic tradition of three hundred years will prove the basis for further development.

The attitude we shall in future adopt towards the antique will be akin to the use of a touchstone—we shall measure our achievements by the relics of antiquity, but we shall never again make the mistake of pedantry. It should be borne in mind that the native tradition is not strong enough of itself to be expanded continuously; it needs to be constantly augmented and fostered by the fusion of fresh ideas. Native and local traditions, notwithstanding their brilliancy, need careful tending; there is a limit to their development, hence revivals of a local style inevitably end in a species of cul de sac. If our attitude towards the Classic spirit is broad enough our position is strengthened, for we can look upon all styles from Egyptian to Italian as members of one family, and for the sake of argument we can include Hindoo and Chinese. The exploitation of any one of these styles would be dangerous, but modern investigation has proved how limited are the moves governing composition and how immutable are the laws of design; this allows of the study of form irrespective of history.

The Classic ideal, as I wish to present it, has little in common with the usually accepted idea of the "Classic School" either of the Renaissance or of to-day. It is Greek in its modernity, Roman in its breadth; it holds all the charm of Italy and the mystery and colour of the Orient. Its purpose is to add stone by stone to the pyramid of tradition, but it does not seek to overthrow the structure.

I now come to the main object of my paper, which is to explain the theory of modern architecture and to hint vaguely at future developments, signs of which are already in evidence. It is not my purpose to deal extensively with recent English work, a better picture of that subject can be obtained by comparing it with the notable buildings recently erected on the Continent and in America. My interpretation of the term "Modern Architecture" is a wide one; it embraces the last two centuries of building evolution and includes structures from Petrograd to Gibraltar, from America to Japan. This course of action enables me to illustrate the tremendous impulses at work shaping the architecture of to-day and destined to influence the work of the future. To prove, on the one hand, that development in design is gradual and depends entirely on the work which has preceded it, and, further, to show how every departure from the sensible and usually accepted leads to meaningless caricature. The iniquitous example of competitions, together with the apathy and carelessness of many architects who do not take their profession seriously, accounts in a measure for the tricky originality and affectation which disfigures English work of to-day.

To rightly estimate the future development of architecture, except through the media of current events, is a task for the Medes and Persians; it is only possible to conjecture what may be reasonably expected from the best activities of the present time. The progress of architecture reveals the intellectual stamina of a people in a way that nothing else does, but there is every indication that the esoteric art is at last assuming an international character, is tending towards academic principles, and the banishment of provincialities from design. In time there will ensue a universal building language understood by all the nations; it implies the realisation of the Classic spirit. In England at present we are desperately lagging in the track of other countries; this is not a lamentation—it is the truth. We are outclassed by the French in their handling of plan and traffic problems, and we are jealous of our American cousins. Our own tradition is little understood and falsely rendered, few realising that the spirit of the tradition alone needs consideration, and not, in the lust for originality, a mad caricaturing of its finest models.

We are on the point of broadening our artistic horizon to the true meaning of modernity and to study the Classic masterpieces of every country; no longer are we passionate to revive historical expressions, but fired with the greater ambition to emulate and excel those masterpieces that have aroused our cupidity. It is at last realised that the romantic and picturesque are not the sole attributes of architectural expression; that laws of form, composition, character, and propriety must be given full consideration. The Babylonian confusion of the past years is clearing and a way out of the architectural maze is shown by the old Classic truths; we have advanced to-day in our critical powers, if not in attainment. It is necessary to approach the problem of design from the Classic standpoint, in the full acceptance of that euphonious term, to view varying conditions of building with that distant attachment which alone produces noble architecture. To reason and apportion plans and elevations in sympathetic consonance, to refuse meretricious and popular movements in favour of the academic, and to elevate intellectual architecture in the public estimation. The possibilities of future development likely to arise from an observance of this theory are illimitable. We must not take too much account of the convenient signposts raised by litterateurs who divide art history into phases and groups and attempt to influence public opinion in a personal way, but we must regard the whole Classic field as offering models; then we shall understand the symbols of our own time and adjust them to specified requirements. Foreigners attribute our weak attitude towards art to the fact that we do not possess a Ministry of Fine Art, owing to the reluctance of our rulers, as well as physical insensibility and the sordid nature of our commercial habit. Many opine that the Protestant religion is the cause: the failing exists in our inaccessibility to foreign ideas of form and composition.

It is my firm conviction, and I feel sure you will agree, that the spirit of the age, in so far as architecture is concerned, is to be found in the world's architecture of the last two centuries. This period contains the impulses which are moving us to-day. True, during this time many experiments were attempted, but these we can afford to pass by; the real achievements alone concern us. If we study our own Classic tradition from Inigo Jones to Cockerell we are surprised at the up-to-date character of the best works, and we are sufficiently conversant with the rules to continue the sequence; this procedure, however, is not entirely satisfactory. We must refer to the French school, particularly to those works of the eighteenth and nineteenth centuries, from Mansart to

Digitized by Google

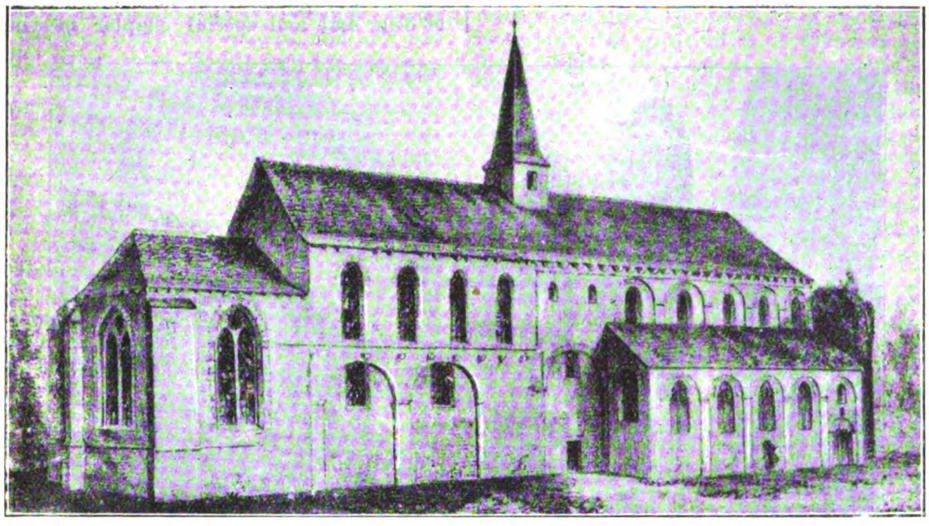
Pascal, and the comparison will prove our shortcomings. We must explore the cities and towns of Italy for the buildings of the same period, particularly Turin, Naples, and Rome. I could name a host of Italian architects whose works should be studied, but those of Maderno, Niccolini, and Sacchoni are comprehensive. Likewise, the work of the Austrian architects in the cities of the Trentino, for example, Nobile, Ferstel, Pertsch, and Molari at Trieste, and Von Hansen at Vienna, and others at Buda Pesth. The modern architecture of Spain has never been clearly explained. The magnificent buildings at Petrograd and Moscow, legacies of the Napoleonic *regime*, are unknown to the majority. Even modern Greece and the cities of the Balkan States hold good motifs. And then we have the example of America with its wealth of modern architecture and the passionate obsession of its leading architects for scholarly work.

Finally, I must add a word for Germany, not in favour of the modern hobgoblin pickel hauben manner, which to my view appears as the play of vulgar children, and in its coarseness shows the brutal influence of the military spirit, but to German architecture of seventy years ago when the French influence was in the ascendant. I need only mention the names of Langhans, Schinkel, Leo van Klenze, and Chateauneuf to convince you of what Germany has lost. We are in a position to-day to refer to and appreciate at their proper value the great folio volumes of the nineteenth century: the compilations of Durand, Krafft and Ransonette, Thiollet, Letarouilly, Haudebourt, Rossini, Isabelle, Canina, and others. These books formed the chief treasures in the libraries of such men as Cockerell and Barry, and I am told that McKim was well versed in their use. Such splendid guides to the theory of architecture should prevent us from following the fatal lure of individualism, and their study should promote consistent sequence. It should also be remembered that an individual architect can do little to work a change; styles of building have been the work of centuries, the produce of nations, and the influence of a single mind can do little to alter the trend of events.

I must warn young architects of the fetish of craftsmanship which has been worshipped to excess; also of the doctrines of many who hold the creed that design is the outcome of construction, and forget that the reverse is the case; conception of the whole inevitably precedes the construction of parts, the latter function being entirely secondary. There is, of course, some overlapping in the application of this theory, but it is recognised that conception subordinates all other considerations. There are two other items to be thought of, namely, adventitious originality and the practice of innovating detail. Both evils are found in contemporary English architecture: one consists of a passion for extraordinary composition of masses, and the other, a lesser evil, is the desire to evolve new suites of mouldings. Both methods are complex and false and collectively result in a species of Art Classic which in effect is the worst legacy of L'Art Nouveau. Then we have the commercial school, noted for its inability to understand architectural character. The coteries who form this school are content to filch any features which are in the fashion and to display their crustacean trophies without regard to convenience or beauty. I have expounded my idea of the term "Modern Architecture." I have referred you to the Antique for beauty of conception, technique and detail, to the Italian Renaissance for pure form, to the French for modern planning and composition, to the English tradition for reticence, to America for breadth of outlook and enterprise, to modern Italy for vigour, and to Germany for frightfulness. By means of the lantern slides I hope to qualify my arguments, and the following synopsis will show the line I intend to take. We shall view some important buildings of the English tradition, followed by the parallel development in America. Then we must discuss some notable examples of the French tradition in France and other countries. I shall touch lightly on one of the finest buildings in Naples. If there were time to pursue the subject we could undertake a world tour. My object will be to show that the modern domestic school needs chastening if it is to compete with the highest examples of the Georgian period in England and the Colonial in America, and that convenience, spaciousness, and simplicity are of more importance than pretty effects. From the monumental architecture of France and America you will deduce opinions concerning similar work in the British Empire.

The whole of my remarks can be summed up in this quotation from one of Professor Cockerell's Academy Lectures given in the 'forties:

"The studies of the beauties and defects of celebrated buildings should be the aim of the scholarly architect; this was the confirmation of theory and led to that knowledge of form and combination which makes the accomplished architect. The importance of this confirmation of theory was admitted by every practical architect. No man invented an order or a series of mouldings, these he accepts from the greatest and most reputed masters' works who have preceded him; he stores designs, books, and portfolios, and prides himself, like the lawyers, on his precedents and authorities. Absolute invention he never proposes to himself for a moment, but by a large study of history and examples he is enabled to detect the petty prejudices of schools, to emancipate himself from the trammels of nationality and fashion, and to regard the works of all times and countries as subject to his own use so far as they may be conformable to strength, convenience, and beauty."



I am not a prophet or a magician, and I cannot lift the veil to show future architecture. I am, nevertheless, firmly assured that the buildings I intend to bring before you to-night contain the secret of the future.

DISCUSSION.

Sir J. J. Burnet, in proposing a vote of thanks, said he felt quite exhausted by the pleasure of the circular tour which Mr. Richardson had taken them, and its very great variety of intensely interesting work. The lecturer had accompanied the display of slides by a running commentary which was sometimes more severe, especially of local work, than seemed quite prudent. But one had to agree with a great deal of what he said. It was all an excellent exhibition of the truism that architecture, no matter of what country, is simply the expression of a cultured mind of the requirements of the generation in which it lives. That phrase, "the expression of the cultured mind," could not be too often reiterated to students. They had just been shown a building designed by military engineers, and another by a lawyer, and he thought it was proof enough that capacity on the part of the architect to intelligently and sensibly meet the requirements of his day with a cultured mind did not confine itself to the possessors of the power of draughtsmanship and the power to show beforehand what is to be done. The architects had for some years thought so much of the drawings and of the interest they could put into them that their architecture had run a great risk of escaping them altogether. If they could get the student to see that his first duty is to get thorough mastery of the craft of architecture he will realise that it involves drawings, specifications, and so on. It may take him years, possibly, to instil any artistic language into his soul; but he could not do it better than by getting into touch with the masterpieces of the past. Architects might try to look on their art more as the painter and the sculptor do on theirs. They should study the past not with a view to remembering its details, but to get its spirit. Having once got that spirit, they would keep it all their lives, and would adapt it to the requirements of the present age. That spirit and not the style should arouse their enthusiasm. He did not think any conscious desire to express originality or any conscious desire to imitate a past style was anything but a form of priggishness—it was not architecture. Even in their conscious restraint the best works of the past were peculiarly lacking in anything like pose. They knew the cultured man went straight to his requirements. It was that faculty the schools could not give a student; they could only help by placing the finest things before him and letting it develop during the rest of their lives. On the other hand, they could bring before him the consciousness which underlay construction. But before a man can construct and design he will generally have learnt enough of the science of construction to know whether or not what he has designed can be constructed. Nowadays architects had to assemble from a great variety of crafts, and there was too much to learn for them to pose as a teacher of every craft. An innate affection for those he has to employ enables the architect to choose sympathetic craftsmen. With such co-operation they could get triumphs of architecture which had never been excelled. At no time was the architect's client more capable of saying what he wanted. At no time were craftsmen more skilled. It lay with architects to give them schemes worthy in spirit of the co-operation of the fine draughtsmen we have and a scheme which will fitly show the men who come after what great clients and what great craftsmen we had.

Mr. Arthur Stratton said that those who had followed Mr. Richardson's writings and his executed work in the last few years knew perfectly well they would hear a paper

Digitized by Google

HASTIÈRE-par-delà.—THE BENEDICTINE ABBEY IN 1856, BEFORE RESTORATION

characterised by scholarship and mastery of the problems of modern architecture as the lecturer understood it. Seldom had they listened to a paper more full of inspiration and more suggestive. Those who are not so familiar with Mr. Richardson's personal enthusiasm might hardly be prepared for such a revelation. To have had such buildings put before them, the pick of several countries, was a privilege they would look back upon many a time in the future. Mr. Richardson's ideas were undoubtedly fine, his vision of a world architecture was inspiration. But they left out certain aspects of architecture which have governed the building arts for thousands of years, and it seemed as if some of those considerations could not be wafted aside. They had had put before them the works of architectural giants. The pitfalls in the path of such a course of study were many—as some were finding out in daily work. But it was very fine, all the same, that they should have these high ideals put before them. Fortunate indeed was the man whose work passed through the fire of Mr. Richardson's criticism unscathed, for it was only masterpieces which appealed to him. He had set before them the Classic ideal; and it was quite evident he would have the architects of to-day and the future, as they should be, men of culture. Culture was defined by Matthew Arnold as "the study of perfection." That, he believed, was the culture Mr. Richardson would spread, and not "Kultur." The address had mentioned the name of Schinkel and other great German architects; but none of their works had been shown. To his (Mr. Stratton's) mind theirs was not the culture wanted in England, and he saw in those works a certain atmosphere which he could only describe as "swank." We in this country were in danger of getting it. One need not hesitate to link it up with its true source, which was Munich-Berlin. Mr. Richardson over and over again referred to the English tradition, and he showed how the Americans had worked upon it. If the Americans could get inspiration from English work, why could not the architects of this country work upon those lines too? Men like Gibbs, Kent, and John Wood, of Bath, understood architecture as needed for the climate of this country. In a cosmopolitan ideal they might lose all national character. He (Mr. Stratton) looked for a future based upon their own tradition, upon those architects of the past whose work contained a great deal of inspiration for the future.

Mr. Ronald P. Jones regretted the lecturer had left one gap in his mention of inspiring buildings, and that was the Palais de Justice at Brussels. That building might be, perhaps, a little theatrical; but it stood absolutely unrivalled. In America the wonderful development of civic architecture seems to have been just as much a response to a public demand as to the spread of scholarly design. Over there an entirely different feeling towards architecture existed. For instance, *laymen who have no architectural training at all read the professional papers.* Architecture, in fact, was one of the subjects of public interest. One could not imagine the shareholders of an English railway consenting to the erection of such wonderful stations as the Pennsylvania Station and Grand Central Station in New York, or the Union Station in Washington. The latter was pure architectural display, being quite useless as a means of despatching people by the trains which run below it. But the citizens were just as proud of it as they had a right to be. The first thing expected of anyone who goes to New York is a visit to the Pennsylvania Station. Such an attitude was something we of this country can have no conception of. But it had every bit as much to do with fine architecture as the culture of a McKim. Until we here can get the same thing we can only go half the distance.

Mr. H. Austen Hall (President), in putting the vote of thanks, heartily agreed with Mr. Richardson's distinction between a loose architectural individuality and the trained one. Sir J. J. Burnet had spoken of the necessity for architects applying a cultured mind to the problems of to-day. Later Mr. Ronald P. Jones had told them it was a cultured public they most required. The object of the Architectural Association was to provide the cultured mind and the trained mind to the student: if they could also influence the public they would congratulate themselves, but they had hardly begun to think of that aspect yet. Mr. Richardson felt a tremendous enthusiasm for all that was fine in architecture, and Mr. Stratton had been hardly fair in confining him to one period. In his personality he was far beyond his writings.

The vote of thanks was then carried by acclamation.

Mr. A. E. Richardson, in briefly replying to the discussion, said the English character was so strong there was no danger of its being lost under the tide of cosmopolitanism—rather it would gain from each wave.

The lecturer concluded by showing a few slides of work done at the A.A. schools as illustrating the remarkable progress under the leadership of Mr. Atkinson.

HASTIÈRE.

By JOHN A. RANDOLPH.

IN one of the recent official reports of the outrages by the Germans in Belgium it was stated that the Curé of Hastière was one of the victims. This would appear to refer to the venerable head of the recently restored Romanesque Abbey* on the west bank of the Meuse, about midway between Dinant and Givet, which had the neighbouring one of Waulsort as a rival, and, for a time, a sharer in property and rule.

Whether the interesting old church suffered at the hands of the Germans is not stated, but it is not unlikely. Hastière Abbey was founded in the ninth century by Wigeric, father of Adalberon, Bishop of Metz; the nave of the church was not begun, however, till 1033, and took two years to construct, the choir dating from 1263.

Jointly with Waulsort Abbey, whose lands were surrounded by those of the Hastière house, it had a troublous

* The new high altar was consecrated by the Bishop of Namur in 1912.

Digitized by Google

existence. At first it was in the Metz diocese, but came under that of the Prince-Bishops of Liège in the thirteenth century.

agreements arose between the two houses, and in 1208 a decision was made that thenceforth Hastière should have its own seal and special chapter meetings, that novices

HASTIERE-par-delà.—INTERIOR OF NAVE OF BENEDICTINE ABBEY.

Already in 968 Othon I., surnamed "The Great," ordered that the two Abbeys should be united under one Abbot. Seven years and ten months later the Pope announced the completion of the arrangement.

KING DAVID AND OTHER MUSICIANS, FROM THE PSALTER OF HASTIÈRE.

Abbot Rodolphe, in 1033, began rebuilding the basilica, but preserved the crypt of the original chapel.

At the beginning of the thirteenth century further dis-

should make their clerical and literary studies there, and all the principal festivals of the year, Easter alone excepted, should be celebrated there. One prelate alone was to preside over the two Abbeys, under the title of Abbot of Waulsort, in whose monastery his election was to take place, but the two communities were to have equal voting powers.

In October 1568, at the orders of the Seigneur de Genlis, a band of French Calvinists attacked the Abbey, and, entering, slew the Sacristan, drove out the monks, broke up the altars and their consecrated stones, and destroyed the monastic buildings, but spared the church. Abbot Placide, a few years before, after the sacking of Waulsort, repaired the tottering remains of that Abbey's church, regardless of the style of the original.

The last Abbot was Grégoire Thibaut, elected in 1773, and the monks assisted at the dispersal of their patrimony.

In 1793 the French Revolutionaries, under Delecolle, Mayor of Givet, fired the church of Hastière, the ruins serving thereafter as a barn, a bark depôt, and finally a smithy.

The restorations began soon after 1826, in which year the Commune had bought the old choir and fitted it up for services. Later on in the year the remainder of the ruins were purchased.

The restorations were apparently not on a great scale, probably owing to most of the available funds having been spent on the purchase of the fabric.

In 1880 a more complete restoration scheme was devised, but not brought to a conclusion, and in 1885 Mr. Van Assche, of Ghent, the architect of the St. Nicolas and Dixmude Town Halls and the restorer of the Pamele Church at Audenaerde took up the work and finished it.

During the progress of the reconstruction the old crypt of the original chapel, with stone seat nearly all round it, was discovered and put into repair.

Hastière Church, as the illustrations show, was very similar to those of Lobbes, Nivelles, and Soignies, but on a smaller scale.

Among the treasures of the Abbey are some very beautiful illuminated psalters and other church books, one of the pages of which we reproduce.

The seal dates from the thirteenth century and shows the Blessed Virgin, seated, crowned and with a nimbus, her left hand on the shoulder of the Divine Infant. The inscription is S. CONVENTVS : ECCLESIE : BEATE : MARIE : HASTERIENS.

WAULSORT.

As for Waulsort, which is stated to have been founded by Count Gilbert, Lord of Florennes, and the charter of con-

Digitized by Google

firmation given by Otho in October 946, it was first tenanted by Benedictines from Scotland and greatly developed, being well known in the fields of literature, science, and art, but flourishing especially under Abbot Widric and his successor (1102-42).

There was a church-jewellery school there from the tenth to the thirteenth century. The Namur Museum had two reliquaries of the Abbey from the Revolution onwards, and in the British Museum, since 1837, is a "History of the Chaste Susannah" in rock crystal.

The remains, after the Revolution, were turned into a country house, the Abbot's quarters, with a turret at each end, being of the seventeenth century. The house stands close to the banks of the Meuse. The site of the Gothic church has been entirely obliterated.

The seal was very similar to that of Hastière, but the Blessed Virgin is represented as handing some object to the Divine Infant. The inscription runs: ✠ BEATE: MARIE: CAPITVLI: VALCIODO.

The small parish church of Waulsort shows traces, on the south side, of blocked-up Romanesque arches, as if there had formerly been an aisle there. Its little steeple is very similar to the ones to be found in the smaller village churches of Surrey.

ROYAL ACADEMY LECTURES: ARCHITECTURE.—II.

THE second of Professor E. S. Prior's four lectures at the Royal Academy was delivered on Wednesday, the 17th inst. In the first, which was reported in our issue of last week, the lecturer introduced his subject of "The Thousand Years of the Flemish Arts" by dealing with the Romanesque and Gothic periods of the Low Countries down to the fourteenth century. The second lecture had for its title

THE FLEMISH RENAISSANCE OF ARCHITECTURE.

In the fourteenth and fifteenth centuries, while Italy was working out its classic Renaissance and making schools of architecture, sculpture and painting, founded on *classic* learning, Flemish sculpture and painting were creating a new Gothic expression of the arts that had a permanence in Northern Europe for another two hundred years.

In his previous lecture Professor Prior suggested that some of the forms and some of the expressions of this Flemish school had their origin in the English development of architectural church style, which we call "Decorated." But he also pointed out that the intrinsic character of the Flemish art was to be found in its own conditions, particularly in the commercial development of the great Flemish towns: Bruges and Ypres in the fourteenth and fifteenth centuries, in the sixteenth Ghent and Antwerp. They were for the later Middle Ages the great manufacturing cities of Europe. For a hundred years Antwerp was the capital city of the world's civilisation, the centre of finance, the home of intellectual progress, the nursery of the arts. Its arts were eminently those of a mercantile community—the arts of corporations of traders, the products of craft guilds, who were monopolists in the possession of art secrets and traders in their beautiful wares.

In the thirteenth century Flemish art had been French—French of the Ile de France—and therefore conditioned by quite another set of influences. The architectural bias still controlled the run of sculpture in France, so that in the fourteenth century all the expressions of image and relief, although they had acquired naturalism, were still ideal. That is to say, French sculpture based representation on universal types. Flemish art was about to turn in the opposite direction. It was to particularise character, and seek effect in the vividness of individual representation, not in the ideality of natural beauty. By the end of the fourteenth century a great revolution had taken place in the ideal of sculpture, due to the new inspiration to artistic effort which appeared all over Europe. Almost contemporary with this came the discovery of oil painting, and the possibilities of using oblong wood panels for pictures.

The style of rich decorative intention which grew up out out of the Belgian prosperity transformed architecture itself. It was the "arts and crafts" architecture which determined what Professor Prior called the furniture phase of fifteenth and sixteenth-century style, not only in Flanders, but in West Europe generally. The frippery of this architectural ornament was borrowed from English style.

In Flanders the conditions as to material available for building were similar to those in our Eastern counties and London, inasmuch as stone had to be imported by water carriage. It came in small pieces, and was reserved for facings and dressings, the body of the walls being in another material. The great cities of Flanders owe their architectural quality to this use of small materials. From early in the thirteenth century brick became the chief building material. Moreover the nearest available stone, that of Tournai, was most of it of hard close grain—blue in tone. The fact of these natural decorative colours—the brown-red of brick and the blue-grey of stone—came to be early recognised in Flemish building. Bronze and oak, marbles black and white and red, were used as rich effects against the ground of the brick and stone, which in most instances was still painted, as in Notre-Dame, Bruges.

Externally the brick and the thin bedding of imported stone made the basic fact of artistic effect. The multitudinous touches of colour, the myriad network of jointings, weave over Flemish work a texture of tinted haze which is that of an autumn wood. The towers and spires of the Flemish cities particularly developed externally those qualities of intricate texture and varied colouring, and contrasts of picturesque forms.

If one may sum up in a single word the essential quality of this period of the Flemish art of architecture one might make the word "picturesqueness" serve the purpose. Its effects are those of texture, of varied hazy, undefined suggestiveness, broken colour, moving brilliance, vibrating sensitiveness. They are not of definite line, or severe logic—the intellectual perfection that belonged to the Greek singleness of spirit, or to the French singleness of constructional purpose.

This picturesque "arts and crafts" architecture of the Low Countries was essentially the art of cities; by its commercial basis for one thing, as that of exporters of artistic furniture—by its material conditions, again, as those of artistic populations who worked up costly materials, with the skill and artifice of established guilds of crafts; and, thirdly, as an art of exterior communistic display and civic magnificence. It expended itself in the great public buildings of a city: the Hôtel de Ville is the characteristic building of Belgium. The clock tower, from which the bells struck that gave the hours to the citizens and called them to assembling, was the especial symbol of civic freedom.

Now, it was in this architecture of citizens that the great change of style which we are accustomed to associate with the sixteenth century occurred.

To us who design imitative architecture the essence of the change lay in the appearance of classic ornaments—entablature, pilasters, pediments, and nude sculpture—in place of arches, traceries, tabernacles, and draped figures on the surfaces of building. Our modern view is that architecture depends upon these stylistic attributes to be architecture at all. Plain building is building, not architecture. But this was not the view of the Renaissance architect—for now from mason-decorators we come to the title of architects. To them plain building did not cease to be any the less fine architecture. On the contrary, there appears in the early Renaissance of Northern Europe, in France, in England, and especially in the Low Countries, an admirable style of building which is fine architecture by virtue of its building sense, since it was definitely constructed to meet conditions of necessity.

As civil building took the place of ecclesiastical building, architecture as an art began recreating its expressions. The first necessity of an architecture, not of caverned halls but of civic rooms, was flat ceilings, because floors were required over, and flat ceilings meant at once the expediency of level-headed windows, fitted with square-angled casements. The arch was impractical for ceilings, and for openings too, directly there was storied building. So the building artist began to find architecture not in mere ornament, but in the facts of building behind it. Gothic ornament became superfluous, and was cast away as faded, wornout finery. It was the discovery of the personal artist as a cultivated designer that established the Renaissance in the North of Europe. Moreover, the ornaments of classical style became necessary, not because builders had undergone conversion, had renounced an ancient paganism and found salvation in a new creed of art, but because in the common-sense of building the Gothic shapes had become an encumbrance, being now difficult to fit to the conveniences and necessities.

The power of the Italian culture of the arts lay essentially in its discipline; it had accepted form and training as the mental equipment of ancient style, and the revival of the Renaissance was a return to the ancient order of Roman civilisation. Decoration in the Gothic schools of architecture had for long proceeded on the principle of a happy-go-

Digitized by Google

lucky performance; but the humanist, as the apostle of intellectual reform, analysed, selected and arranged.

Renaissance style developed as the principle of selection by emphasis, of getting interests by contrast of line and tone, so as to direct attention to the balance of the composition. It may be considered as on all fours with the artistic perception that developed the art of tones and values in which the Flemish painters excelled.

This discipline of abstract learning did not, however, last, and it passed away in the increasing vogue of the pattern-book. During the sixteenth century there was a constant issue of treatises on architecture, which took the form of designs for builders, and were followed by similar pattern-books of design dealing with furniture, jewellery, &c., which look like pages from an Army and Navy Stores catalogue.

While Gothic ornament and Gothic construction were still universal in actual building, compositions of Renaissance architecture had found their way, following Italian examples, into subject pictures, and into relief sculpture of sacred legend. Between picture architecture and pageant architecture there was the closest connection. In fact, the celebrated painters and sculptors were continually employed in devising triumphal arches, or in the composition of scenery for masques and pageants. Temporary erections of considerable elevation were constantly in creation. These were confections, not building. Decoration runs riot in them, and riot is the only term one can apply to that medley of ornament which, appearing in the pattern-books of architecture, were more or less carried out in building materials. After the trial of every possible motive by the seventeenth-century ornamentalists, architecture drifted into the abstract curves of the Louis Quinze era.

There were, therefore, two currents fighting for the mastery in the Renaissance architecture of the sixteenth and seventeenth centuries.

In thinking of the expressive picturesque architecture of the sixteenth and seventeenth centuries in Flemish cities, it must always be remembered that the traditions of the Middle Ages were still in existence as to workmanship. The crafts were thoroughly taught. In the strict guild discipline craftsmen were compelled by the rules of their Guilds to be craft-artists. If, as in the ancient laws of Guilds, the bad work of craftsmen was burnt nowadays, would there not be, asked Professor Prior, as great a holocaust as that which smokes on the altar of German invasion?

The protracted dominance of Gothic tradition in church-building came to an end in the architecture of the Jesuits, as it is called. In the celebrated example of St. Michael at Louvain we have not merely a decorative surfacing that learned artists and sculptors could compile, nor merely the pageant structure that the sculptor conceived. But we get a reasoned constructive adaptation of classic forms to building necessity. However, in this matter Jesuit architecture was in no sense distinctively Flemish. In such interiors as that at Namur the accessories are Flemish, the design of the fabric is that which is common to Reformed Church architecture, whether to that which is usually called the Protestant, or to its counterpart, that of the counter-Reformation.

ANIMAL FORMS IN ART.*

By CHARLES AITKEN.

FEW people realise how constant through the ages has been the effort on the part of man to capture and fix by means of artistic representation the fleeting motions of the furred and feathered fellow-inhabitants of his globe. The prehistoric reindeer hunters covered their tools and weapons, and even the walls of their cave dwellings, with scratchings of the animals they hunted and lived on. These carvings show an amazing, almost photographic, sureness of vision in catching the quick motions of animals, while they are marked by an instinctive appreciation of animal nature which is rare in any period of art. It is not until the comparatively modern work of Japanese artists that we get any observation of animal nature which rivals theirs in its lighting truth and grace.

The rendering of animal forms among primitive races seems to be prompted by several distinct, though often mingled, reasons. There is the true artist's simple, instinctive pleasure in depicting life, form, and movement. This reason accounts for the Eskimo decoration and the Assyrian wall-carvings. Secondly, we have the vast subject of Totemism, leading to infinite representations of animal forms. Many savage races still believe themselves united by kinship to some animal, which becomes the badge and guardian spirit of their tribe. The use of animals in heraldry is not entirely remote from Totemism; the heraldic crest was the badge of a clan and symbolised a desired spiritual affinity to the characteristics of the animal selected. Lastly, we have the depiction of animals for superstitious or religious reasons.

The Assyrian and Egyptian artists both excelled in representing animals, though in very different fashions. The Assyrian exaggerated the muscles, broadened the forms, and delighted in power and strength, showing chiefly savage beasts fighting with his kings and warriors. The Egyptian, on the other hand, elongated his figures, and gave them elegance and grace; but in his intense conservatism he failed to give the sensation of vitality.

Greek art was primarily interested in the human figure, and the Greek gods had human form. Many excellent representations of animals are found, however, in Greek art, particularly on vases, coins, and metal vessels. But, on the whole, animals play a less important part with them than in the Egyptian art, with which the Greeks were well acquainted.

The Romans used animal forms very largely in their decorative work, and animals are perhaps the most usual motif of their mosaic designs for floors and walls. They also developed a decidedly realistic, almost impressionistic, school of landscape painting, in which animals and such subjects as "Orpheus Taming the Beasts" frequently occur.

Christianity exercised an influence hostile rather than helpful to art, especially in the domain of the representation of animals. The fear of idolatry was always before the early Christians, and they refrained from the sculpture of animals lest such carvings should be worshipped, like the animal gods of the pagan religions which surrounded them on all sides. Nevertheless, as time went on, Christians found it necessary to make use of art in order to spread the new ideas they were preaching. Animals were adopted as symbols. Popular legends, such as that of Orpheus, were followed almost literally. The scholars and theologians, forgetting the sanity of Greek thought, sought in Nature nothing but the material symbols of intricate theological speculations. St. Basil frankly says that it is of less importance whether griffins and unicorns exist than to draw moral example from their supposed habits. A collection of the current stories about animals, real and imaginary, was made at Alexandria by a Greek writer at the end of the seventh century under the title of "The Naturalist." The book was translated into more than twenty languages, including Nubian and English, and throughout the Middle Ages it was the most read book after the Bible. On these collections of stories about beasts and moral reflections on their habits, real or supposed, entitled "Bestiaries," were based the animal carvings and paintings of Gothic art. Almost all animals came to stand as types of good or evil, sometimes of both. Art was long in emerging from these amazing moral and theological analogies, but gradually we find curiosity prompting artists to original observation of animals when opportunity allowed.

In painting it was only comparatively recently that animals came by their own. The idea of painting an animal for its own intrinsic beauty and interest did not occur to men until art was far advanced. The first artist to paint animals with a loving attention was the Veronese, Pisanello. The popularity of equestrian portraits did much to bring animal painting into prominence, yet it was perhaps due to a lesser painter, Jacopo della Ponte, or Bassano, that animals at last came to be regarded as sufficient to form the main interest of a picture, apart from any Biblical, historical, or portrait theme. Delighting in the agricultural life of his native Alps, he initiated the special branch of painting known as "Animal Genre," and he soon found eager followers amongst the Dutch and Flemish artists of the seventeenth century.

The fashion for the portraits of favourite horses and dogs led to the patronage of such painters as Stubbs, Sartorius, and Ben Marshall by the sport-loving squires of the Georgian era in England. Stubbs, moreover, did other services to art, and his book on the "Anatomy of the Horse" became a useful classic. James Ward, in succession to Paul Potter, recognised animals as worthy to form the only interest of a painting, while he gave this branch of art imaginative vigour by selecting savage beasts and showing them in the very heart of Nature away from man. Ward's brother-in-law, George Morland, followed more closely on the lines of

* Abstract of a Lecture delivered last week at Carpenters' Hall.

Digitized by Google

the Dutch painters, substituting an English homeliness for a Dutch.

During the Victorian Era, which intervened between the work of Morland and the delicate sympathetic apprehension of Mr. Swan and other recent interpreters of animal nature, many able artists devoted themselves to depicting animals—Sir Edwin Landseer, Ansdell, Bristowe, and Huggins, to mention only a few—but their work reveals at times an ever-glossiness of surface and a want of insight into the truest dignity of animal nature characteristic of the period in which they lived, and it is to the French sculptor, Barye, that we are indebted for a really dignified presentation of animal life in modern art.

LONDON COUNTY COUNCIL.

GENERAL POWERS BILL, 1915.

THE London County Council this week decided not to proceed further with the proposals contained in Parts III. and IV. of its General Powers Bill, 1915.

Part III. dealt with the erection or rebuilding of houses after the passing of the Act in such manner as to prevent flooding of the premises, consequent on back-flow of sewage from drains. Part IV. in general provided that it should be illegal to build upon land the surface of which was below the level of 5 feet 6 inches above Trinity high-water mark, or which was so situated that efficient drainage by gravitation was impossible.

The reason given for not proceeding with these parts of the Bill was that opposition by the Borough Councils was very strong, and that the Premier had expressed unwillingness to give facilities to Bills of a contentious nature during the present crisis.

STATUARY IN LONDON.

An offer by the committee of Lloyds to present to the Council a marble statue of the late Right Hon. William Huskisson, by Gibson, was responsible for an interesting, and at times amusing, discussion on the educative and artistic value of statuary in London. Mr. Huskisson, it may be recalled, was at one time a prominent political figure, and, among other official appointments, held successively the offices of Secretary to the Treasury, Chief Commissioner of Woods and Forests, and Secretary of State for the Colonies.

Sir George Goldie, who objected to the committee's proposal to erect the statue in Pimlico Garden, said that if there was one thing more than another lacking in London it was verdure, and he would not personally consent to the sacrifice of a single blade of grass for the erection of statuary. His opinion was borne out by the fact that, when architects and sculptors tried to improve St. James's Park, there was a great public outcry, and it was said the park would be ruined by their interference.

Sir John Benn ventured the opinion that a thing rarer in London even than verdure was artistic statuary, and he envied some of the Continental cities with their beautiful statuesque adornments. With the contention that London should not be defaced by anything ugly he agreed entirely, but it not infrequently happened that a statue was worthy of a place of honour, purely on the score of artistic merit, and irrespective of the identity of the person represented. He suggested that the Council should take the opinion of some high authority on Art, such as Sir Aston Webb, on the merits of the statue which had been offered to them. It would be a mistake, in the interests of art, to reject the offer without first examining whether the quality of the work entitled it to publicity, apart from the historical value of the monument.

Mr. Andrew Taylor, himself an architect, expressed the opinion that the statue in question was unquestionably a work of art, and worthy of a public position. He reminded the Council that the sculptor, Mr. John Gibson, was a distinguished Royal Academician who had spent most of his life in Rome, and that at Burlington House there was a Gibson Gallery. This was one of the best examples of Mr. Gibson's work, and although apparently certain members of the Council would like to throw a blanket over all statues of Venus, or other figures in the nude, this particular statue was perfectly respectable.

Mr. Hutchinson, who earlier in the discussion had moved the reference back of the committee's recommendation, explained that, if he had his way, he would take down all statues in London, because they were all equally bad.

Mr. Taylor, continuing, contended that such statues did much to familiarise the man in the street with the history of his country, and some neighbourhoods in the Metropolis were so drab and squalid that anything which added to the artistic appearance of the streets was an advantage. The public gardens on the Continent—the Luxemburg Gardens, for instance—derived much of their beauty from the presence of groups of sculpture.

Mr. Bernard Holland facetiously expressed some doubt as to whether the sight of the statue would inspire the street arab and costermonger to inquire into the history of the gentleman represented. (Laughter.) On the question of artistic merit, he did not much admire Roman statues, though the statue of James II. outside Westminster Abbey was a handsome work of art. For himself, he would prefer to see in London more statues of naked nymphs and goddesses—(laughter)—and in any case it was a mistake to mix up history with art.

Mr. Cotton suggested that, if there were any anxiety to adorn London with statuary, a pilgrimage might be made to the Paris Salon, and an appropriate selection made from the many excellent examples of the sculptor's art there exhibited. (Laughter.)

The recommendation of the committee to accept the statue was ultimately agreed to.

ATTENDANCE ON SUB-CONTRACTORS.

THE Council of the Surveyors' Institution in a letter to the Council of the Society of Architects, covering a memorandum on this subject, stated that a deputation from the Institute of Builders, received by the Quantity Surveyors' Committee of the Institution, drew special attention to the obstacle against accurate estimating imposed by the practice of leaving, in bills of quantities, the cutting away and attendance on sub-contractors to be priced in a lump sum by the principal contractor. In modern buildings the hot-water work, sanitary work, and electric wiring is usually considerable, often indeed very extensive; and this class of work, too, is frequently delayed until the building is in an advanced stage, necessitating a good deal of work which might be avoided were the requirements known earlier.

Accurate estimating is to the advantage equally of the building owner and of the contractor, and the Council of the Surveyors' Institution feel sure that anything which can be done to secure an improvement in that respect will receive the ready support of architects.

The Quantity Surveyors' Committee are satisfied that the builders are not without some ground for complaint, and that the importance of dealing in adequate detail with "attendances" is not fully realised by all who practise as quantity surveyors.

They are of opinion that the matter should be dealt with more precisely than is frequently the case in preparing bills of quantities, in order to obviate the friction which often arises between the parties to a contract owing to a misunderstanding as to the liabilities imposed respectively upon the building owner, the general contractor, and the sub-contractor. The following notes and suggestions are therefore recommended for the consideration of members of the Institution.

The word "attendance" does not comprise any works of construction (*e.g.*, pipe trenches, castings, &c.), but it does comprise all cutting away and making good after, receiving materials and providing storage space for them, providing water, allowing the use of erected scaffolding and fixed plant. If so provided in the contract it should also be taken to cover the payment of accounts as certified by the architect, before their inclusion in the general certificates.

The particular matters dealt with by the builders' deputation were: (1) Attendance on heating engineers, (2) attendance upon hot-water engineers, (3) attendance upon electricians.

In dealing with attendance on these or other special tradesmen, there should be given an account, as detailed, clear and succinct as possible, of the work which it is proposed the sub-contractor shall do, stating precisely what services will have to be rendered to him.

When the sub-contract is of minor importance, all the needs of the case will be met by leaving the estimator, after inspecting the drawings, to assess the value of the work to be done in this connection and set it down against the descriptive item.

When the sub-contract is important, the same account of the work to be done should be given, and, in addition, an indication of the extent of the attendance, stating: (*a*) The number of holes for pipes, &c.; (*b*) the number of pipe

Digitized by Google

brackets, &c., to be fixed; (*c*) the chases for pipes, &c.; (*d*) the number of the points for electric lighting, electric bells, radiators, sanitary fittings, &c.

A general item to the following effect should also be inserted:—

"In so far as is possible an indication has been given of the specific attendance required, but the contractor is to allow here for any further expense entailed in waiting upon special tradesmen, or for the disturbance of his work caused by them, and for giving them all facilities for the execution of their work."

Care should be taken that the nature of the attendance which will be afforded them is clearly set out in the sub-contractors' contracts.

It is considered inadvisable in ordinary circumstances to make money provisions to be expended in "day-work."

The Council of the Society after careful consideration of the memorandum found themselves able to approve in principle the recommendations of the Surveyors' Institution, but made suggestions for alterations in detail more particularly in regard to descriptive items, summarised in the cases of sub-contracts of minor importance, and set out in full on works of importance.

They also suggested the following additional clause:—

The words "attended upon" or "attendance" do not comprise any works of construction (*e.g.*, pipe trenches, castings, &c.), but they do comprise all cutting away and making good after receiving materials and providing storage space for them, providing water, and allowing the use of erected scaffolding and fixed plant. Where the sub-contractor does not allow in his tender for any special scaffolding that may be required in connection with his work, the general contractor must provide it. The words "attend upon" or "attendance" must also be taken (if so provided in the contract) to cover the payment of accounts as certified by the architect, before their inclusion in the general contractor's certificates.

The Council of the Surveyors' Institution agreed that the verbal alteration suggested would be an improvement. But with respect to the provision of special scaffolding they considered that this could not be taken as included in the general term "attendance," and should be the subject of a separate item.

On further consideration the Council of the Society agreed to this, and subsequently the Council of the Surveyors' Institution in thanking the Council of the Society for the interest they had shown in the matter, intimated that their committee would take advantage of the suggestion made by the Society when re-issuing the circular on attendances on sub-contractors.

Meanwhile, they express a hope that the members of the Society of Architects may support the quantity surveyors in carrying out the principles embodied in the memorandum.

ILLUMINATING ENGINEERING SOCIETY.

A MEETING of the above Society was held at the House of the Royal Society of Arts on the 16th inst., when a paper by Mr. F. W. Thorpe was read and discussed dealing with the Development and Design of Lighting Fixtures in Relation to Architecture and Interior Decoration. From the paper we take the following extracts:—Modern architects and designers often excel in one style only, showing considerable skill and individuality in associating old forms and details with modern requirements. In the latter part of this paper some general problems applying to fixture design as a whole are dealt with, and instances mentioned in which the co-operation of the architect, the fixture designer, and the illuminating engineer is required. The fixtures designed in old and historic styles were intended to carry candles and oil lamps; but those of the present day, besides carrying the lamps, have also to provide access for the "fuel"—*i.e.*, provision must be made for the working into the design of tubes conveying gas or electric wires. This alone, apart from the difference in the illuminant itself, has naturally had a material influence on the design of modern fixtures.

THE INFLUENCE OF EARLY LAMPS ON MODERN FIXTURES.

As artificial light became general with the advance of illuminants, the importance of the lighting fixture as a decorative object was recognised, culminating in the candelabra produced during the Italian Renaissance and the seventeenth and eighteenth century French periods, now models for most countries, and which many people consider have not since been excelled. As new illuminants appeared the nature of these fixtures was influenced, yet in many cases the original forms were retained. When twentieth-century illuminants are used the question must, however, arise whether some of these old models can be properly adapted to the new conditions. The simple "boat lamp" of the ancients, and also the crusie, rush, and tinder-holder were subordinate to other articles of furniture, for we may safely assume that in these days artificial light was avoided when possible, and therefore the fixture did not receive the attention or occupy such an important position as the lighting fixture of to-day. Yet, whereas the antique lamp often surpasses the modern lamp in its artistic qualities, it was invariably defective from a purely utilitarian standpoint; the modern fixture, on the other hand, although more efficient, seldom reaches the antique standard of beauty. The shape of the antique boat lamp was revised during the time of the Renaissance, again during the French Empire period, and is being revived once more in harmony with the prevailing style of Neo-Greek architecture.

LIGHTING FIXTURES BASED ON ARCHITECTURAL AND DECORATIVE PERIODS.

The design of the lighting fixture has always been contingent upon architecture and decoration for their form and detail of ornament. The Romans were luxurious in the furnishing of their homes, and bronze candelabra were amongst the finest objects of furniture. The slender bronze models, of which a few shapes seem to have become standardised and made in great numbers, were mostly for domestic lighting, being made, like the modern electric standard, in two sizes for use on the table and the floor. The large marble candelabra were for religious and State ceremonial purposes. The bronze models invariably had a flat capital upon which the boat lamp was stood. In some cases the stand terminated in a spike or projecting arms from which lamps were suspended. All these models afford excellent material on which to base modern designs, and their frequent use by architects of the present day is justified by their beauty of design and proportion.

Reproductions of candelabra designed and produced by craftsmen of the past are often adapted with a rigorous conservatism to modern requirements, their importance and correctness in the decorative scheme often out-weighing their practical utility as a lighting appliance.

ECCLESIASTICAL FIXTURES.

It has been remarked that the candelabra mentioned above, besides being important objects in the home, played a part in the religious ceremonial of the ancients, as it does in many of the cathedrals and churches of the present day.

In the modern lighting of places of worship to-day we must uphold conservative treatment, remembering the importance of tradition in Ecclesiastical Art. Forms, sometimes symbolic, have been in use for centuries. The various styles of church architecture have all given rise to characteristic types of lighting fixtures of remarkable beauty of design and craftsmanship.

Churches are designed on traditional lines, and embody the individuality of the architect. Modern improvements, such as lighting fixtures, should form an essential part of the scheme, and must be in harmony.

During the Italian Renaissance the candelabra were revived along with the tradition of antique art; old forms were adapted to changed ideas. From this time onwards candelabra appear in many different types and made in various materials, the finest examples of which are to be found in the churches of Italy. On these models the majority of modern church candelabra are based.

The architects of the Renaissance made full use of the lighting fixture in the embellishment of the exterior and interior of the churches and palaces of Italy. The lantern bracket outside the Strozzie Palace at Florence surely adds interest to the building.

FIXTURES FOR DOMESTIC LIGHTING.

Except in the mansions of the great the progress of illumination in the homes of the middle ages was comparatively slow, just as the methods of illumination were extremely primitive. But from Tudor times onward, although means of illumination were still limited, there was constant change in the type and style of the lighting fixtures.

The iron rush and candle holders used in England in domestic farm and cottage lighting of this date include many ingenious contrivances, some possessing distinct artistic merit.

Architects and designers in endeavouring to preserve in their reproductions of various rooms the correct atmosphere of the period require to be correct in regard to the gas or electric light fixture quite as much as in other details of furniture. Hence, if a room is to have the correct Early English atmosphere it is necessary to adhere to the correct old forms. This atmosphere is, after all, only obtained in the decoration; the fixtures are added to and regarded as furniture, and are primarily of æsthetic value owing to their shape and the colour-harmonies they make possible. Because the illuminant is modern the resultant effect, with due consideration, need not be incongruous. In a modern room possessing decorative qualities, if it is not the aim of the owner to be correct in detail, any type of lighting fixture can be employed so long as it is in good taste.

In Mid-Tudor and Stuart times the close connection between the English and Dutch Courts was the means of introducing new ideas into furniture, which depended upon colour as well as form for effect. This, again, had its effect upon the accessory arts, and is noteworthy as leading to the introduction of the Flemish candelabra, perhaps the most popular of all lighting fixtures at the present day.

From this sprang the classic revival in furniture and interior decoration in England and France. Chippendale, Adam, Sheraton, and Hepplewhite were designing furniture each in their distinctive styles with which we are familiar, and their contemporaries in France were moulding the Louis XIV., XV., XVI., and Empire styles for which the French are so famous, and which were destined to influence the decorative art of the whole world.

In the remainder of the paper some of the problems that are of interest to architects, fixture designers, and lighting engineers of the present day are discussed.

Various Phases of Interior Lighting.

A broad distinction may be drawn between domestic and public lighting. In the former individuality can be shown in the selection of fixtures, and the purchaser is free to follow his personal desires. In the case of public lighting (by which not only the lighting of the streets, but of halls and rooms, belonging to or habitually used by the public may be understood) novelty in design or system is not desirable, an efficient lighting scheme, supported by fixtures well adapted to the architecture, is the chief requirement.

It is difficult to lay down definite rules as to the method of lighting best adapted for various rooms, every architect will have a different idea, and lighting requirements vary so much with the nature of the building, both in the amount of illumination and the effect desired. Care must be taken in the selection of the system, for we consider the relative efficiency of the direct, semi-indirect, and indirect principles, but often forget their relative decorative values. The fixture should be considered in effect as well as efficiency. Generally speaking, a ball room demands an effect of gaiety, a dining room comfort, and a library an air of repose—all of which conditions may be secured by the judicious selection of fixtures, strength of illumination, and use of colour. Certain general requirements should be fulfilled, whether we are dealing with an old interior or a modern room. One of the most important of these is the choice of appropriate glassware or shades to go with the fixture. On entering a room lighted by artificial means the natural tendency is for the eye to travel involuntarily to the brightest object. One not infrequently finds good metal work in combination with unscreened lamps or mantles giving a glaring effect and hard shadows, such as are not desirable from a practical standpoint and are usually out of harmony with the æsthetic claims of the room. Broadly speaking, lighting that is inconvenient to the eye is also inartistic.

The correct shading of artificial illuminants should therefore be considered in connection with fixture design. In some cases it may be said that the best lighting is unobtrusive. There are instances in which the illuminated surroundings constitute the vital point of interest and it is preferable not to have one's mind distracted by speculations as to the origin of the artificial light. But in many other cases the light source may be made an essential part of the scheme of decoration. A fixture equipped with pleasantly shaped and coloured shades adds considerably to the decorative value of the room both by night and day. Fixtures are apt to be considered too exclusively from the standpoint of their appearance in daylight. At night-time, when they fulfil their useful function of illuminating the room, their appearance should also be pleasing. Care must therefore be exercised to ensure that the artificial illuminant does not distract the eye in following the lines of the fixture. One meets many cases in which the great brightness of a lamp placed within a clear glass lantern makes it impossible to see the metal work. One may therefore lay stress on the importance of decorative silk and glassware in the scheme of lighting. There are instances in which the desire to be correct to period makes it impossible to use diffusing globes and bowls now becoming so common, but they certainly have an important rôle to fulfil.

Strictly speaking, the use of an electric lamp or incandescent mantle in an Adam, or Tudor, interior, may be considered an incongruity. But the incongruity is lessened if the modernity of the source can be concealed. Thus electric candles can be used with silk shades, and it is difficult to find a prettier effect. Modern illuminants can be used with antique lanterns if diffusing glass is employed to screen the lamps from view. The white glass bowls used occasionally with Flemish features are admirable in this respect. By such methods various old models, where desirable, can be adapted to the requirements of modern illumination.

(To be concluded.)

Correspondence

[The Editor will not be responsible for the opinions expressed by Correspondents.]

Church Building and the War.

Sir,—During this time of stress and strife the Church plays an important part, but there is yet much to be done; many of her sons have now joined the forces and are stoutly fighting for the country, but what of those left at home to keep alive the commercial interests that must be maintained for those who will be returning to civil life when all is settled?

It has been stated, and rightly too, that building schemes are being held back, and the only reason given is that they are waiting until the war is over; if this lasts for any length of time many of the smaller firms will not be strong enough to stand the strain, and the larger firms will be sadly affected.

On the other hand, there is every reason for pushing forward all works, building and otherwise, because labour and nearly all materials are lower now than they will be when peace again reigns; and many firms are ready to put in low quotations in order to keep things going. It must be borne in mind that some of these firms are keeping open the situations of men who are now in the fighting line. This of itself is reason enough why they should be supported.

One reason more why the Church should give particular attention to this matter now is because her people have turned to the more serious matters of life here and hereafter, as shown by the greater attendances and devotions. Surely this larger interest should favourably affect the problems of expense?—Yours truly, Churchman.

Building Costs after the War. Will they Increase or Decrease?

Sir,—There is a tendency throughout the country amongst private owners, companies, and especially local authorities to postpone building operations until after the war in the hope that the cost of building will then be considerably lower than at the present time. I have recently been discussing the assumption underlying the attitude of the parties mentioned with numerous architects, builders' merchants, and contractors in South Wales, and have been forced to the conclusion that not only is there no likelihood of a reduction taking place on the termination of hostilities, but that an increase is quite probable. The reasons for this conclusion may be stated as follows:

1. Owing to the general insecurity, the tightness of the money market, and the increased cost of materials, an enormous amount of work that had been contemplated before the commencement of the war has not been proceeded with. It is probable that the value of such suspended contracts in the United Kingdom considerably exceeds £100,000,000, and we should probably allow for at least five times this amount for continental suspensions. On the termination of hostilities the bulk of this work will go forward, and the demand for material will be enormous.

2. In addition the towns and villages of Belgium, France, and Poland that have been partially or wholly destroyed will need to be rebuilt, and we may safely expect that the huge demand for material thus set up will have a tightening effect on the markets.

3. For many years past the prices of most classes of commodities have advanced very considerably. Since the outbreak of the war the increases have been abnormal, and although reductions are probable when peace is restored it is not likely that prices will return to the pre-war level. It may be assumed, therefore, that the cost of living after the war will be higher than the cost before the war. In that event there will be considerable labour unrest, and wages in the building trade as in other trades must go up. The demands of the building artisans and labourers will, of course, be resisted, but as the labour needs of builders are likely to be great, whereas the volume of available labour will be reduced by the wastage of war, the men are almost certain to have their demands conceded.

4. We are informed that after the war there will be a huge boom in trade. In that event the demand for capital will be great and the rate of interest will be high. If the prices of labour, materials, and money increase, how can we anticipate any considerable reduction in the cost of building?

I have put forward these considerations not in any dogmatic spirit, but in order that they may be examined by men who are thoroughly familiar with conditions in the building trade. Public bodies and building owners generally are usually not in a position to judge the trend of affairs in such a complex industry as building, and I feel sure that they would welcome information as to the future from those who are in a position to speak with authority. Are these people wrong in supposing that there will be a reduction in building costs after the war? If so, a clear pronouncement on the subject would surely be of advantage to the building trade. Perhaps some of your readers would give expression to their views on the subject.—Yours, &c.,

London Statues.

SIR,—The following extract from the *Daily Telegraph* of February 24 is illuminating with reference to statues in London:—

"Mr. St. John Hutchinson . . . said if he had his way he would have every statue in London taken away. He thought they were all equally bad. . . . Sir George Goldie . . . said he thought any architects or sculptors who ventured into the parks of London ought to be promptly hung."

What fine specimens of legislators! One of them so illiterate as to split his infinitives and to misuse his verbs, and both of them so dead to the claims of differentiation in the artistic quality of our public statues. How can any man whose business takes him to the neighbourhood of Trafalgar Square be blind to the surpassing merits of Le Sueur's "Charles I.," Sir Francis Chantrey's "George IV.," and Hamo Thornycroft's "General C. G. Gordon"? It is true that Sir George Goldie expressed "no objection to statues in the streets, but he hated to see the place of grass in parks and gardens taken up with statues." But is there one of us who would desire (or should desire) the removal of Sir George Frampton's "Peter Pan," or the Lord Holland statue facing Kensington Road? The latter is upon private property; but I venture to include it, as it is only proper to remember that many of the public parks and gardens became public subsequent to the erection of the statuary groups thereon.

I have but specified a few of the very best groups, as the list of good works might be amplified. All I desire of our legislators is to exercise discrimination in their public chatter, and also not to blame architects for work which is not theirs.—Faithfully yours,

PERCY L. MARKS.

February 1915.

IT has been decided that in the present state of France, and in respect that so many artists are at the Front, the usual exhibitions of the Société des Artistes Français and of the Société Nationale des Beaux-Arts will not be held this year.

BUILDING PROGRESS IN THE PROVINCES AND SUBURBS.

A LIST OF WORKS PROJECTED OR COMMENCED.

(N.B.—Local Authorities, architects, and others are invited to submit full particulars for insertion in this weekly list. Where districts are not entered against names of architects and builders the address is as a rule local.)

ASBESTONE
IN TILES FOR ROOFS, IN
SHEETS FOR PARTITIONS & CEILINGS.

As used by the L.C.C., H.M. Office of Works, Admiralty, War Office, Metropolitan Asylums Board, and the leading Architects.

BEST FOR ROOFS,

BECAUSE

(1) It is very light, and a far lighter superstructure can therefore be used.
(2) There is no loss by breakage either in transit or fixing, as is the case with ordinary slate.

BEST FOR PARTITIONS AND CEILINGS,

BECAUSE

(1) It is fire-proof, vermin-proof, and damp-proof.
(2) It is rapidly fixed to a wood or steel framing.
(3) It is dry when it is put up, and therefore papering and painting can be proceeded with immediately.

FULL PARTICULARS & ILLUSTRATED BOOKLET will be sent FREE on application.

2,581. Jan. 31, 1914.—Fortunato Beradi, fu Enrico, 6 Via Chiatamone, Naples. Ventilators.

Any of the above specifications may be obtained from J. D. Roots & Co.

AT a meeting of the Devonport Education Authority last Monday, a letter was read announcing the sanction of the Local Government Board to the borrowing of £10,240 for the rebuilding of King Street Council School. The Higher Education Sub-Committee reported that the revised plans for the extension of the Technical School had been approved by the Board of Education.

THE Local Government Board have sanctioned, without holding a local inquiry, the Shipley Urban Council's application to borrow money for the erection of new public offices on the Manor House Estate. It is understood that the work will be commenced as soon as arrangements have been made for temporary offices. The scheme involves the demolition of the old Manor House, one of the most ancient buildings in the neighbourhood. It was erected in 1630, and has many architectural features which are to be preserved by the erection of some of the stonework in Crowgill Park. The premises have been used for public offices for the last thirty-five years.

SWANSEA CORPORATION HOUSING SCHEME.—Mr. ERNEST MORGAN, Architect

WE illustrate above interior and exterior views of the six sample houses erected at Mayhill from the designs of Mr. Ernest Morgan, architect, for the Swansea Corporation housing scheme of 500 houses for the working classes. The best class house contains a living room, 12 feet 6 inches by 13 feet 8 inches; scullery, 12 feet 11 inches by 7 feet 11 inches; larder, 3 feet by 6 feet 10 inches; w.c. and porch on ground floor, and on the first floor three bedrooms, the largest of which is 13 feet 5 inches by 10 feet 9 inches. Each house is fitted with cupboards, wardrobes, dresser, and kitchen range. The "Twin" Combination Bath system of Messrs. Mills, English & Co., an invention of this Swansea firm, has been installed, which will be a great boon to the householder, as little or no attention is required, and hot water is given automatically. With this patent the boiler can be fixed in almost any corner, for the space required is 2 feet by 2 feet. The "Twin" system is recommended for garden cities, cottages, bungalows, and other occasions where space and economy are all-important considerations.

THE
Architect and Contract Reporter.
FRIDAY, FEBRUARY 26, 1915.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addresed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than* 2 P.M. *on Thursdays.*

COMPETITIONS OPEN.

BRADFORD.—March 31.—The Corporation invite competitive designs for the re-planning of streets in the central area of the City of Bradford. Mr. Reginald Blomfield, R.A., will act as assessor. Particulars may be obtained on application to the undersigned, accompanied by a deposit of £1 1*s.*, which will be returned on receipt of a *bonâ-fide* design. Mr. Frederick Stevens, Town Clerk, Town Hall, Bradford.

STEPNEY.—The Borough Council invite architects to submit designs in competition for the proposed municipal buildings, and have appointed Mr. Henry T. Hare, F.R.I.B.A., to act as their assessor. Conditions of competition may be obtained after March 1 on receipt of £1 1*s.* deposit, which will be refunded on submission of a bona-fide design or the return of the conditions within fourteen days of their receipt. Mr. G. W. Clarke, Town Clerk, Municipal Offices, 15 Great Alie Street, Whitechapel, E.

CONTRACTS OPEN.

ABBOTS LANGLEY.—March 9.—For erection of two pairs of semi-detached cottages near Bedmond, in the parish of Abbots Langley, for the Watford Rural District Council. Deposit £1 1*s.* The Council Offices, 9 Market Street, Watford.

BARMING HEATH.—March 4.—For erection of an assistant medical officer's house at the Lunatic Asylum, for the Kent County Asylums Committee. The Engineer at the Asylum, Barming Heath, near Maidstone.

BARNET.—March 2.—For erection of thirty-two cottages and a block of flats on their housing estate, for the Urban District Council. Deposit £1 1*s.* The Surveyor to the Council, 40 High Street, Barnet.

BARNET.—March 3.—For extension of the nurses' home in connection with the Union Infirmary at Barnet, for the Guardians of Barnet Union. Deposit £2. Messrs. White, Son & Pill, architects, 15 High Street, Barnet.

BARNOLDSWICK.—March 1.—For the erection of a pumping station adjoining the existing one, for the Urban District Council. The work will be let in three sections, as follows: (1) builders; (2) joiners; (3) slaters. The Gasworks, Barnoldswick.

BARNSLEY.—March 4.—For erection of a new Town Hall in Church Street. Deposit £2 2*s.* Mr. W. P. Donald, Town Clerk, Town Clerk's Office, Barnsley.

BIRMINGHAM.—March 5.—The Commissioners of H.M. Works and Public Buildings invite tenders for the execution of ordinary works and repairs to the buildings in their charge in the Birmingham, Cardiff, Liverpool, and Nottingham districts during one year from April 1. Deposit £1. H.M. Office of Works, &c., Storey's Gate, S.W.

LEEDS.—March 4.—For the reconstruction of drainage at Leeds Head Post Office, for the Commissioners of H.M. Works and Public Buildings. Deposit £1 1s. The Assistant Architect, H.M. Office of Works, Infirmary Street, Leeds.

MIRFIELD.—March 13.—For the extension of shedding and offices in the Council's yard, Fold Head, for the Mirfield Urban District Council. Deposit 10s. 6d. Mr. Edwin Gill, engineer and surveyor, Council Offices, Mirfield.

NORTHAMPTON.—March 15.—For building 20 cottages at Hollowell, for the Corporation. Deposit £2. The Waterworks Office, Fish Street, Northampton.

NORTH SHIELDS.—March 6.—For pulling down existing buildings on the Union Quay, North Shields, and erecting and completing shop, stores, offices, &c., including reinforced-concrete retaining walls, floors, partitions, &c., for the Tynemouth Borough Council. Deposit £2 2s. Mr. J. F. Smillie, borough surveyor, Tynemouth.

NOTTINGHAM.—March 11.—For the erection and completion of twenty-seven cottages and two blocks of tenements on the site adjoining Pennyfoot Street and Newington Street. The City Architect, Guildhall, Nottingham.

OLDBURY.—March 12.—For erection of an extension block of schools to accommodate about 490 children at Rood End, for the Urban District Education Committee. Send applications and £1 1s. deposit by Feb. 27 to Mr. A. Long, architect, New Street, West Bromwich.

SCOTLAND.—For the various building trades in connection with the construction of five new cottages and steadings for smallholders, and with the adaptation of the existing farm steadings on Pentland Mains Farm (1½ miles from Loanhead Station). Mr. H. M. Conacher, secretary, Board of Agriculture for Scotland, 29 St. Andrew Square, Edinburgh.

SCOTLAND.—March 1.—For execution of joiner work required in the erection of electricity sub-station at Walton Street, Dundee, for the Corporation. Mr. H. Richardson, M.I.E.E., Dudhope Crescent Road, Dundee.

SCOTLAND.—March 1.—For additions to farm steading at Greens, Mosstowie. Mr. J. Wittet, architect, Elgin.

SCOTLAND.—March 1.—For the following works required in connection with the proposed construction of a public convenience in Gairbraid Street, Glasgow, for the Corporation—viz.: (1) mason, brick, joiner, &c., works, and (2) sanitary fittings. The Office of Public Works, City Chambers, 64 Cochrane Street, Glasgow.

SHEFFIELD.—March 2.—For the excavation and construction of a concrete tar and liquor tank, 141 feet 6 inches long by 58 feet 6 inches wide by 24 feet deep, at their Grimesthorpe Station, for the Sheffield United Gas Light Company. Mr. J. W. Morrison, M.Inst.C.E., the Company's Offices, Commercial Street, Sheffield.

SHREWSBURY.—March 5.—For erecting new pig boxes and executing small repairs at Crowmoor Farm, for the Salop County Council. The County Land Agent, County Buildings, Shrewsbury.

SLEAFORD.—For proposed alterations and additions to premises in Northgate for new Council chamber and offices, for the Rural District Council. Deposit £1. Mr. W. B. Marsden, surveyor, 74 Southgate, Sleaford.

SWINESHEAD (LINCS.).—For the erection of two houses, farm buildings, and alteration works at Brand End Farm, for the Small Holdings Committee of the Holland County Council. Mr. E. J. A. Christie, county land agent, County Council Offices, Boston.

TREDEGAR.—March 15.—For erection of a caretaker's lodge at the new cemetery, Cefn Golen, for the Tredegar Urban District Council. Mr. W. Lloyd Roach, surveyor to the Council, Bedwellty House, Tredegar.

TYWARDREATH.—March 6.—For erection of a Council school for girls and infants at Tywardreath, for the Cornwall Education Committee. Deposit £1 1s. Mr. B. C. Andrew, architect to the Committee, Biddick's Court, St. Austell, or at the Boys' School.

WALES.—March 1.—For erection, completion, and maintenance for six months of proposed infants' school for 186 scholars, together with domestic and manual training rooms, at the New Broughton Council School, near Wrexham, for the Denbighshire Education Committee. The work will be let in two contracts: (Contract 1) permanent work, which include concrete and brick foundations, walls, chimneys, and outbuildings; (2) superstructures of a semi-permanent type, timber framed weather boarded and slated roof. Send applications and £1 1s. deposit by March 1 to Mr. W. D. Wiles, county architect, 42A High Street, Wrexham.

WALES.—March 2.—For the erection of two public conveniences (four-stall)—viz., one at Llanbradach and one at Nantgarw—for the Caerphilly Urban District Council. Mr. A. O. Harpur, surveyor, Council Offices, Caerphilly.

WALES.—March 4.—For building forty to fifty semi-detached houses at Cwmaman, near Aberdare. Mr. A. S. Cameron, architect, 14 Victoria Square, Aberdare.

WALES.—March 23.—For the extension and alteration of "Wauniago," near the Carmarthen Mental Hospital, for the Committee of Visitors. Messrs. George Morgan & Son, architects, 24 King Street, Carmarthen. Send application by March 1 to Mr. W. J. Wallis-Jones, clerk to the visitors, 34 Quay Street, Carmarthen.

WALKDEN (LANCS.).—March 5.—For the construction of a pump house for the Barton Old Hall sewage farm, for the Worsley Urban District Council. Deposit £2. Mr. J. Howard, surveyor to the Council, Town Hall, Walkden.

NEWMAN'S PATENT REGULATING HELICAL SPRING HINGES.
WITH PATENT STOP TO PREVENT OVERWINDING.
The power can be instantly taken off while the Hinges are being fixed and afterwards adjusted to close the door conveniently. They cannot be overwound.
Made in Brass and Iron, 3, 3½, 4, 4½, 5, 6, and 7 inches.

NEWMAN'S NORTON SYSTEM.
MADE IN MALLEABLE IRON.
The Best Door Spring and Check for closing doors without noise.
Pressure is direct, but diminishes pleasantly as door is opened.
Also made with Patent Regulator to latch stubborn bolts.

NEWMAN'S PATENT INVINCIBLE,
WITH AND WITHOUT PNEUMATIC CHECK.
Will hold door *rigidly to centre*, but diminishes in power as door is opened, allowing comfortable passage through.
The *Best* Spring to close door *against wind pressure*, and the most suitable for Banks, Schools, and other public buildings. Made in sizes to suit all doors.

Made solely by W. NEWMAN & SONS,
DOOR SPRING MAKERS AND BRASSFOUNDERS,
Established over 100 Years. HOSPITAL ST., BIRMINGHAM.

FIRE RESISTING SAFES—A CORRECTION.

OUR attention has been called to the fact that our issue of January 29 last contained by inadvertence the following incorrect and misleading statement:—

"It is *apropos* to mention that the firm of John Tann was, in 1843, under its previous name of E. Tann & Sons, the original inventor and patentee of the system of rendering safes fireproof by the generation of moisture, a system which is now used by nearly every safe manufacturer."

Upon investigation we find that the original inventor of this system of rendering safes fire-resisting by the use of chambers containing non-conducting and moisture-generating composition was Thomas Milner, who patented his epoch-making invention in February 1840, nearly four years before the patent of Messrs. Tann referred to above. Moreover, as a result of the making and selling of safes according to this latter patent, certain actions were brought by Messrs. Milner for the infringement of their prior patent rights, which resulted in Messrs. Milner being granted a perpetual injunction in Chancery imposing a penalty of £500 on persons making, vending, buying, or using any safe in which such vapourising materials should be found. The defendant was ordered to pay the costs of the three actions.

As a natural result of these actions, a "Disclaimer and Memorandum of Alteration" to Messrs. Tann's patent of 1843 was advertised in prominent newspapers and duly attested, stamped, and filed with the Clerk of the Patents of England in 1851.

The fire-resistance of Milner's safes to-day is secured upon the principle and plan discovered by Thomas Milner and patented by him in 1840, and strengthened by successive improvements, the result of careful study and extensive practical experience.

Having perused the terms of the disclaimer referred to above, we express our apologies to Messrs. Milner, upon whose claims in this direction we regret having cast reflection by the incorrect statement in our issue of January 29 last.

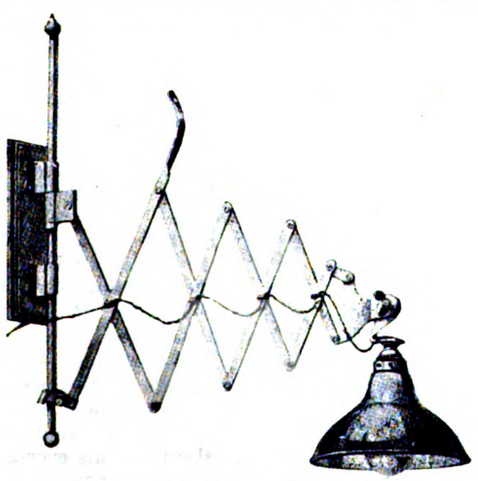
G. E. C. ACTIVITIES.



WE wish to draw the attention of our readers to two new examples of the enterprise of the General Electric Company.

Counting cheapness everything, consumers have in this country for many years been fully contented with the conical opal shade for incandescent electric lamps where the shade served purely utilitarian purposes. But where æsthetic or scientific considerations affected the choice, they have had at their disposal a number of shades which, by reason of the cost of the material and of the accuracy with which they had to be made, were considerably more expensive. These conical opal shades were made almost entirely in enemies' countries, and as a result of the war the supply has been largely cut off. Many, however, are being imported from neutral countries, but whether they are actually manufactured there is a different matter altogether. Rather than rely upon such sources for their supplies the General Electric Co., Ltd., of 67 Queen Victoria Street, London, E.C., have, in conjunction with an old-established firm of English glass manufacturers, introduced a new opal shade, the pleasing appearance of which affords a remarkable contrast with the foreign product. Quite apart from point of view of appearance, the improvement in the colour of this glass operates to increase

G. E. C. ENGLISH-MADE OPAL SHADE.

the efficiency of reflection from its surface. Those who cast their minds back over the history of electric light will recollect that no material change has been made in the form of the foreign conical reflector since it was first introduced; the shape for the metal-filament lamp is identical with what it was for the carbon lamp. As illuminating engineers know, the efficiency of the reflector depends largely upon the position of the filament of the lamp relative to the reflector, so that however suitable the old reflector was for the carbon lamp its inefficiency as a reflector for the metal filament lamp is beyond question. In preparing the new designs the General Electric Co., Ltd., have therefore made sure that the shape suits the position of the filament in a tungsten lamp. The design

G E. C. EXTENSIBLE SWING BRACKET, NO. F. 3,092.

takes the form of the pleasing "Ogee" shape which is shown in the illustration. Two standard sizes are stocked, the smaller one 7 in. diameter by 4 in. deep, and the larger 9 in. diameter by 4 in. deep. Although the prices naturally show an increase upon those of the foreign article the General Electric Co. feel sure that the consumer will willingly pay the increased price when it is pointed out to him that he is buying a British product and that he is getting value for his money, not only in the more pleasing appearance of the shade but also in the higher efficiency of reflection which will rapidly repay for the few extra coppers which he is spending.

Among the numerous electric-light brackets and fixtures for strictly utilitarian purposes which the General Electric Co., Ltd., have produced is the one illustrated here. Some of the leading particulars of this new bracket (Patent No. 15,607/13) briefly stated are:—

The projection is adjustable between 8 in. and 32 in.; there is a horizontal swivelling action within a semi-circle, the angle of reflection is adjustable, as shown by the wing-nut provided. By means of the curved extension of one of the arms of the lazy-tongs the light can be raised to a fixed point 27 in. above the normal position. The material of construction is polished brass. The bracket is particularly valuable in business offices, drawing offices, &c. It is known as the "Varsity," and has the catalogue No. F. 3,092.

A CHINESE CONTRACT.

The General Electric Co. of China, Ltd., has, we are informed, secured the contract for all the Government requirements for Osram drawn-wire tungsten lamps and electrical supplies for Hong Kong for the year 1915.

THE LONDON ASSOCIATION OF MASTER DECORATORS.

A MEETING of the Executive Committee was held at the office of the Secretary, 92 Queen Victoria Street, E.C., on Wednesday, February 17. In the absence of the Chairman of the Committee, Mr. C. E. Wilkinson, President, took the chair.

The question of the publication of the Association book of prices of Painters' and Decorators' Work was considered, and it was decided to proceed with the printing forthwith. It was pointed out that the prices were the result of a considerable amount of work on the part of practical men, who had given very careful consideration to the subject. It was resolved that copies of the price list should be sent to the Royal Institute of British Architects, Society of Architects, Architectural Association, Surveyors' Institution, and other similar bodies, such list being issued as the official price list of the Association, which might be safely taken as a guide in all cases of dispute affecting work in the London area.

Messrs. Story & Co., of 49 Kensington High Street, were unanimously elected members of the Association.

A letter was read from the Secretary of the National Federation of Associated Paint, Colour, and Varnish Manufacturers with reference to the arrangement made as to prices of proprietary articles for the public and the trade respectively.

Mr. John Anderson expressed his pleasure at the result of the outcome of the conference held between the Federation and the National Association of Master House Painters and Decorators, and it was agreed that a full report of the matter should be made at a general meeting of the London Association on March 9 at 7.30 P.M.

It was unanimously resolved that the Secretary be instructed to write to the Secretary of the National Association of Master House Painters and Decorators, expressing the great appreciation of the London Association on the valuable work done in connection with the conference above mentioned.

The Education Committee reported that it had been decided to present book prizes to the value of £5 to four students in the London County Council School of Building, Brixton, viz., David H. Stephens, James F. Johnson, Albert E. King, and Claude J. M. Humphries.

The Chairman brought up the question of incorporating the Association, and, after some discussion, the matter was postponed to the next meeting for further consideration.

THE Electors to the Slade Professorship of Fine Art have re-elected Mr. Edward Schroeder Prior, M.A., Honorary Fellow of Gonville and Caius College, into the said Professorship. Mr. Prior is an A.R.A., F.S.A., and F.R.I.B.A., and was a pupil of Mr. Norman Shaw, R.A. He was one of the founders of the Art Workers' Guild, of which he was Master in 1906. He has been Secretary of the Arts and Crafts (London) Exhibition Society since 1902. His publications include "The History of Gothic Art in England," "The Cathedral Builders in England," and "The Mediæval Figure Sculpture of England." He represented Cambridge against Oxford in the High Jump, Long Jump, and Hurdles in 1872, and was High Jump Amateur Champion in the same year.

BRITISH PATENT SPECIFICATION.

Selected by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

The first date given is the date of application; the second, at the end, the date of the advertisement of the acceptance of the completed specification.

No. 2,643. February 2, 1914.—Fastenings and stays for hinged windows. F. J. Burton, Xela, Oakfield Road, Woking, Surrey. This invention relates to fastenings for casement windows and the like of the kind which are adapted to secure the window when closed and to hold it when open. The fastening comprises a sliding bolt which is spring controlled, the handle being capable of a swinging or turning movement. Fig. 1 shows a construction of fastening having a comparatively short handle, provided with a stud adapted to engage slots in a striking plate, such as is shown in fig. 3. The bolt (*a*) is mounted in barrel (*b*), and has behind it a spring (*c*) tending to push it outwardly. A pin (*d*) extends from the bolt (*a*) rearwardly, and is pivotally connected at (*e*) to handle (*f*).

A projection (*g*) is formed on the plate (*b*¹) of the barrel (*b*), and acts as a fulcrum for the handle (*f*) to withdraw the bolt from engagement with the striking plate (*h*) shown in fig. 3. In use the plate (*b*¹) is fixed to the window, and the plate (*h*) to the frame or mullion. The bolt head (*a*) enters the hole (*i*) in the plate when the window is closed, and thus secures it. To open the window the lower end of the handle (*f*) is pressed from the position shown in fig. 1 to that shown in fig. 2 and withdraws the bolt; the window can then be opened and the handle raised so as to bring the projection (*j*) thereon into engagement with one of the slots (*k*) in plate (*h*), which is furnished with a tongue (*l*), and has two slots (*k*) to enable the plate to be fixed either right or left hand. In the example shown in fig. 4 the handle (*m*) is furnished with holes (*n*), and the striking plate (*o*) has a bracket on which is a pin (*p*), adapted to engage in one of the holes (*n*) so that the window can be held open at variable distances.—Jan. 6, 1915.

THE voting among the members of the Amalgamated Society of Carpenters and Joiners for the Assistant-General Secretary is as follows: A. G. Cameron, 6,920; J. L. Wright, 5,506; R. Robertson, 1,210; C. H. Young, 905; A. Dearnley, 872; and F. W. Lindley, 559. A number of overseas votes have yet to be included

VARIETIES.

THE Local Government Board have sanctioned the borrowing by the Withernsea Council of £7,500 for the South Cliff seawall scheme.

IT is estimated by Mr. J. Owen Parry, the engineer, that the proposed domestic scheme of sewerage for Cwmamman urban area in the Amman Valley will cost £13,109 15*s*.

WE regret to announce the death of Mr. Ernest Brown, who will be known to many of our readers for his association with the Leicester Galleries in Leicester Square, W., which, in conjunction with Mr. Phillips, he opened some years back. The late Mr. Brown enjoyed a high reputation as a salesman.

THE Hull Corporation Electricity Committee have instructed their engineer to prepare a report as to the practicability of supplying electricity to the houses of the working classes. It was stated that, with metallic filament lamps, and current even at 4*d*. per unit, electricity would be a cheap illuminant.

ARCHBISHOP WALSH, of Dublin, has informed the Housing Committee of the Dublin Corporation that he has decided not to use the Ormond Market building area as the site of a cathedral. He was to have purchased the site from the Corporation for £12,000. The Housing Committee have now directed the city architect to set in motion as soon as possible the erection of artisans' dwellings upon the site, acquired by the Corporation with that object. It is understood that difficulties arose in regard to the dispossession of tenants and the acquisition of river frontage.

THE annual meeting of the Sheffield Building Trades' Conciliation Board was held at the Builders' Exchange on Tuesday last. Mr. A. J. Forsdike, who has been President of the Board since its inception, was re-elected, Mr. H. Hodge (stonemasons) was elected vice-president in succession to Mr. Limage (bricklayers). Statements were made showing that there had been more employment than was anticipated at the beginning of the war, and arrangements had been made to keep the men fully employed. At the annual meeting of the Plasterers' Local Standing Joint Committee, Mr. J. E. Chadwick and Mr. S. W. Copestake were elected president and vice-president respectively.

WE have received the 1915 edition of "The Practical Electrician's Pocket Book," which is again edited by Mr. H. T. Crewe, M.I.Mech.E. (London: S. Rentell & Co., Ltd.). Although the amount of information and the number of pages has increased of late, the price still remains the almost nominal one of 1*s*. It must, however, in fairness be mentioned that the pages are less than in the previous edition, despite the inclusion of some new chapters. The Pocket Book and Diary sets out to give in a condensed and handy form much information relating to all branches of electrical work which it is difficult to obtain in a single volume elsewhere.

A SERIES of six Carpenters' Company lectures on the architecture of Belgian towns will be delivered at University College on Thursdays, at 5.30, beginning on March 4. The lectures will be respectively as follows: March 4, M. Victor Horta, Director of the Academy of Fine Arts, Brussels, on "Architecture in Belgium since 1840"; March 11, M. C F. Caluwaerts on "A General Review of Belgian Towns—Brussels, Malines, and Louvain"; March 18, M. Portielje, Honorary Secretary of the Royal Society of Architects of Antwerp, on "Town Planning in Antwerp, Past and Future"; May 6, Mr. Arthur Stratton on "Bruges and Ypres"; May 13 and 20, Mr. P. Abercrombie on "Brussels." The lectures will be public.

IN August last it seemed as if the theatrical world might be one of the last to be able to report "Business is as usual." But since then the public, helped perhaps by certain episcopal leading, has accepted theatre-going as a very pleasant duty. It is noteworthy that this ever-generous profession seems to-day even more than usually ready to give their services. To London performances there is no quicker finger-post than the "Official Theatre Guide," which may be seen attached to the walls of tube stations and clubs, hotels, libraries, and anywhere where men most do congregate. The "O.T.G." strictly limits its announcements to theatrical productions, and room can be made on it for all West-End plays. Particular care is paid to ensure accuracy—no easy matter in a world of sudden changes. This A.B.C. for London playgoers was instituted by the Society of West-End Theatre Owners nearly two years ago. Since then its scope has been enlarged and its usefulness increased.

FORTHCOMING EVENTS.

Monday, March 8.

Surveyors' Institution: Adjourned Discussion on papers by Mr. Isaac Dixon and Mr. E. H. N. Ryde on "The Report of the Land Enquiry Committee on Rating," at 8 P.M.

Tuesday, March 9.

Institution of Civil Engineers: Paper entitled "The Improvement of the River Clyde and Harbour of Glasgow, 1873-1914," by Sir Thomas Mason, A.M.I.C.E., at 8 P.M.

Wednesday, March 10.

Carpenters' Hall: Paper entitled "Brick Buildings," by Mr. H. M. Fletcher, M.A., F.R.I.B.A., at 7.45 P.M.

Tuesday, March 11.

London University: Lecture entitled "A General Review of Belgian Towns—Brussels, Malines, and Louvain," by M. C. F. Caluwaers (Member of Royal Commission on Belgian Monuments and Sites), at 5.30 P.M.

Society of Architects: Paper entitled "The Law relating to the Remuneration of the Architect," by Mr. A. Montefiore Brice, Barrister-at-law, at 7.30 P.M.

Historical Association (London Branch): Lecture entitled "Elizabethan London," by Sir Sidney Lee.

Friday, March 12.

Town Planning Institute: Lecture entitled "Some of the Larger Problems of Town Planning," by Mr. Thomas A. Mawson, Hon. A.R.I.B.A., at 6 P.M.

SOME OLD LONDON PANELLED ROOMS.

THE Folk-museum is an educational institution which has not as yet found full acceptance in England, where we lack the thoroughness and completeness with which such models are assembled in Scandinavia, and, to a lesser extent in comparison, in Germany. For the purpose of illustrating the national life of a past epoch in a country's history any collection, however extensive, of disassociated objects of ancient craftsmanship falls far short of its full educational value for the general public to a full-sized model of a dwelling of some particular period, completely and consistently furnished with a full equipment of household chattels of the same date. For the student, whether professional or dilettante, comparison of numerous examples of the same item, chimney-pieces, doorways, buffets, &c., is a necessity to enable him to avoid the formation of a narrow outlook and the restriction of imagination. But for the general public one concrete and complete example is more readily grasped and its lesson more easily assimilated.

At the Victoria and Albert Museum, South Kensington, an approach to the principle of the Folk-museum has been made by the arrangement of the architectural treatment of complete rooms, two of which, both from old London houses, form our present subject, and however much we may regret and reprobate the modern commercial practice of stripping old houses of their interior finishings to minister to the vanity of wealthy purchasers, a very different view may be taken of the propriety of preserving in proper association the parts of a complete room, which *force majeure* has displaced by the destruction of the building of which it was a component.

The first of these rooms to which we now draw attention is the panelled room known as the "State Room" in the "Old Palace" of Bromley-by-Bow Middlesex. The house formerly stood in St. Leonard Street, Bromley-by-Bow, and was erected in 1606. It has been suggested that the building and its ornamental details may have been the work of John Thorpe, but there is no very convincing evidence of the surmise beyond the fact that he was in practice from *circa* 1570 to 1610, *during* the time that the house was built. It should, however, be always remembered that there were others besides Thorpe who designed and built houses contemporaneously with their more famous associate.

The "Old Palace" is connected by tradition with the name of King James I. The King is believed, in the early years of his reign, to have founded a settlement in the parish of persons chiefly of Scottish nationality, and it has been conjectured that at the same time he built the house as a residence or hunting-lodge for himself. Of more weighty evidence is the fact that his arms, mottoes, crest, and initials figure prominently in the room now in the museum, and that the manor of Bromley was in the possession of the Crown about the time of the erection of the building.

The house was altered and partly refitted in the reign of Charles II., and again more extensively about the year 1750, when it was converted into two dwellings, probably for City merchants, many of whom lived in the parish at the time. For about a century, after being divided, the house was occupied as a boarding-school and was known as Palace House School. From 1874 until its destruction, part of the building was used as a club and part finally as a lodging-house, the remainder being occupied by a firm of colour-workers who used the "State Room" as a store. In 1893 the property was acquired by the School Board for London for the purpose of erecting a school, and the building was demolished.

At the time of demolition the "State Room," which was situated on the ground floor at the back of the house, was fitted with a partition, two pinewood doorways, one on either side of the fireplace, three sash-windows, and an inner marble mantelpiece; but these details, which were added in the eighteenth century, did not come into the possession of the museum when the room itself was transferred. As set up for exhibition in the museum, the panelling of the room has been slightly rearranged and parts have been renewed. As we now see it, therefore, the room is a "restoration" and the panelling covers only three sides of the room.

The panelling is of more than ordinary interest from the scheme of grouping of the different panels, a plan which appears to have been otherwise comparatively seldom adopted for wainscoting. It is, as frequently is the case in contemporary work, divided at intervals by pilasters, in this case of the Doric order with plain moulded bases, pedestals, and capitals, the shafts being decorated with strap ornament, elaborately worked in low relief.

The chimney-piece, which is of very elaborate construction, exhibits a marked architectural character. It measures 11 ft. 10 in. in height, reaching almost to the ceiling, and is 9 ft. 6 in. in width. The fireplace has a stone lining with mouldings carved with acanthus and other ornament, and a stone frieze elaborately carved in high relief with birds and monsters amid floral scroll-work. The overmantel is an elaborate composition, perhaps one of the finest specimens of the type consisting essentially of a central panel containing a coat-of-arms, flanked on either side by a niche.

Digitized by Google

Of no less interest than the wall treatment of the "State Room" is that of the original plaster ceiling, a work of great richness, planned on a pattern of intersecting squares, quatrefoils, and shaped panels, with eight enriched pendants hanging from the points of intersection of the strapwork ribs, these latter being moulded and adorned with a trailing pattern of fruit and flowers. The arms of King James the First ornament the central quatrefoil panel, and six others bear busts of Joshua, Hector, and Alexander, each twice repeated. The resemblance of these busts to those of several ceilings in Scotland suggests that Scottish craftsmen may have been employed in the building or decoration of the "Old Palace."

From Clifford's Inn, Fleet Street, there has come to the Victoria and Albert Museum another panelled room, constructed between the years 1686 and 1688 for John Penhallow, a Fellow of the Inn. This room is the earliest example in the museum of English panelling of the later Renaissance, and it is interesting to note how very far advance had been made in the purification and closer fidelity to Italian precedents by our English craftsmen from the Renaissance of the beginning of the century as illustrated by such work as was seen in the "Great Palace" of Bromley-by-Bow.

The Clifford's Inn room is panelled in oak, with applied carvings in cedar, which, although elaborate in design and execution, avoid the over-realistic treatment which is usually associated with the school of Grinling Gibbons. The size of the room is 18 ft. 6 in. by 14 ft. 10 in., and 9 ft. 10 in. high. In this small apartment, while one end is principally occupied by the fireplace and the other by a pair of windows, the two longer sides each have two doors, symmetrically arranged. The practicable doors, however, are at the ends of their respective side walls, and it is clear that the others, which are dummies, were introduced as a part of the design to correct the lack of balance which the necessities of the plan of the building imposed upon the designer of the internal decoration. For it must be understood that the panelling of this room was but a part of the furnishing of the chamber allotted to John Penhallow in the Inn. It is interesting to note that the design of the dummy or decorative doors is varied from that of the actual or practicable openings.

These two rooms in the Victoria and Albert Museum form the subject of two separate monographs, in which, for the small sum of sixpence each, may be found the history and description, with photographs, of the various parts, as well as measured drawings by Mr. A. E. Bullock, A.R.I.B.A.

NOTES AND COMMENTS.

EXCEPT for their kindred associations, one cannot regard the conglomeration of the Florence Nightingale and Sidney Herbert statues with the Guards Memorial in Waterloo Place as a successful piece of civic design, whilst the assemblage is rendered simply banal by the inclusion of the lamp-posts.

The grand new highway contemplated by Glasgow as a continuation of the Great Western Road from Anniesland through Duntocher and Bowling is in its form essentially a garden-city road or boulevard. With a central tramway road 40 ft. wide, wheeled-traffic ways 30 ft. wide each side of this, then 13 ft. of turf and trees, and a final 7-foot footway, we have such a thoroughfare as would scarcely have been suggested in Britain but for the garden-city movement. From a practical point of view the proposed road will provide for the extension of one of the main arteries of the city in a manner which indicates an appreciation of the increasing quantity and speed of road traffic. It will provide for cheap tramway travelling facilities for the public in a manner which will ensure increased speed with decreased danger. It will relieve the present congestion and prevent the further congestion of the Dumbarton Road. It will open up the land in a proper manner in the direction in which Glasgow tends to expand. It will render possible by high speed tramways the desire of housing and social reformers to spread the population over wider areas, and prevent the congestion which is common to our tenement system of dwellings, and of which many bad examples exist in our midst. It will further form a connecting link between the great industrial centre and the city's proposed recreation ground at Balloch, and one of the beauty spots of world renown.

A report by the Highways Committee on arterial roads in Greater London was submitted at a meeting of the Middlesex County Council. It was pointed out that Middlesex as a county stood quite unique in regard to its traffic. With the increase in motor traction, and the trend of commercial enterprise in the way of rapid delivery of goods by light cars, by which traffic is diverted from railways, the committee consider that at no distant date the necessity for new roads and widenings of existing thoroughfares in Middlesex would become an acute question. New trunk roads were badly required

(1) From the north to the south and south-western parts of the county.

(2) From Paddington, through Acton and Greenford, to a point to the west of Uxbridge.

(3) From Denham, through Ruislip, Wealdstone, Stanmore, Hendon, Finchley, Friern Barnet, Southgate, Edmonton, and Wanstead (Essex), to the Colchester Road.

The committee felt strongly that the foregoing were the directions in which the want of new arterial roads was most badly felt. It would add much to the appearance of all roads to provide as much open ground as possible, but it had to be borne in mind that the provision of boulevards along roads was an expensive matter, and it was questionable whether or not, considering the climatic conditions of the country, the result of such a provision would justify the outlay. The question of how the cost was to be borne had not been considered up to the present. The committee hoped that town-planning schemes in Middlesex would not be finally settled until the question of new lines of arterial roads was disposed of. The schemes could then be super-imposed on the lines of the suggested roads, and could be made component factors.

Very naïve is the appendix of the committee of the Exeter Diocesan Architectural and Archæological Society to their solemn protest against the wanton destruction of ancient monuments in Belgium, France, and, to a minor extent, in England by the modern Huns. They doubted whether the protest would check the devastation—the Teutonic vandals might never hear of it—but they felt they must record it so that their successors might know they did not pass it over in silence.

Public works of all kinds are, under the stress of war finance, viewed askance by Government, but an excuse of the Fishery Board is really amusing in its ineptitude. At a meeting of Stonehaven Harbour Trustees a letter was read from the Fishery Board in regard to the concreting of the Old Jetty, the Board stating that they were advised that the season was quite unsuitable for the laying of concrete, and that it would be desirable to suspend operations during February and March, and to push on faster with the removal of the coffer dam. This being sent to Mr. Barron, C.E., Aberdeen, the Harbour Board's engineer, he reminded the Trustees that dull, damp weather was the best suited for laying concrete. As the whole season had been, and promised to be, exceptionally open, he saw no reason to suspend the operations, and also that provision was made in the specification regarding the making of concrete during unsuitable weather. He therefore did not think it was in the interests of the Trustees to order the suspension of any part of the works. It was agreed to send the engineer's reply to the Fishery Board.

In the course of a lecture at Birmingham University, Mr. Barry Parker, speaking against the archæological method of design, made a good point when he claimed that, just as architecture, if it were ever to be a living art again, must evolve forms suited to present-day requirements and present-day methods of building, and not continually be harking back to first one and then another of the catalogued styles, so town-planning, to be a living art, must, while embodying all that the past could teach, before all else meet, logically, present-day conditions and requirements, as well as the special circumstances of the individual case.

WAR ITEMS

IN connection with the campaign undertaken by the Board of Trade, on the advice of their Advisory Committee on Commercial Intelligence to assist British manufacturers and merchants to secure trade formerly in the hands of German or Austro-Hungarian firms, the Board continue to receive a very large number of inquiries for the names of sellers or buyers of articles of which the sources of supply or markets have been interfered with by the war.

Special arrangements have been made in the Commercial Intelligence Branch of the Board of Trade for dealing with these inquiries, and list 9 of articles which inquirers desire to purchase is now ready and may be obtained by United Kingdom manufacturers and traders.

British firms interested, as suppliers, in any of the goods mentioned should communicate with the Director of the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C.

In accordance with the practice that has been established for H.M. Trade Commissioners in the British self-governing Dominions to visit the United Kingdom officially from time to time, so that manufacturers and merchants may have the opportunity of consulting them on any matters connected with their business, or of obtaining information as to the possibilities of extending their trade, it has been arranged that H.M. Trade Commissioner for Canada (Mr. C. Hamilton Wickes) shall shortly pay an official visit to this country. Among the matters in regard to which he is prepared to give information and advice are the appointment of agents, methods of marketing and distribution, terms of payment, names of probable buyers of British goods, statistics of imports, and rates of Customs duties in Canada. Mr. Hamilton Wickes will attend first at the offices of the Commercial Intelligence Branch of the Board of Trade in order to meet representatives of those firms who may be able to see him in London, and afterwards he will visit such trade and industrial centres in the provinces as it may appear most advantageous to visit in view of applications that may be received from firms in or near those centres, and from Chambers of Commerce.

The United Arts Rifles is a volunteer regiment recruited for home defence from the artistic professions. Many prominent artists, actors, singers, and musicians are members. The force has just moved into new headquarters, the Imperial College Union, in Prince Consort Road, behind the Royal Albert Hall. A matinee concert will be given at the Theatre Royal, Haymarket, on March 26. Mr. Frederick Harrison has kindly given the use of the theatre, and many members and friends are helping. Among them are Mr. Thorpe Bates, Miss Elsie Janis, Mr. Ben Davies, Miss Gertrude Lonsdale, Mr. Harry Tate, Mr. Plunket Greene, Mr. Harry Dearth, Miss Marie Lohr, Mr. Basil Hallam, Mr. Fred Wright, Mr. Godfrey Tearle, Mr. Nelson Keys, Mr. Hayden Coffin, Mr. Arthur Bourchier, Miss Violet Vanbrugh, Miss Marie Lloyd, Mr. Howard Jones, Sir Arthur Pinero, Miss Muriel Foster, Mr. Donald Calthrop. With such a list success is assured.

ILLUSTRATIONS.

R.M.S. "AQUITANIA."

OUR illustrations this week give only a bare idea of the sumptuous fitting of the Cunard liner *Aquitania* as carried out from the designs of Messrs. Mewes & Davis.

The restaurant or saloon in the first-class accommodation measures nearly 150 ft. in length and 100 ft. in width; the height at the sides is 10 ft., and in the centre, where there is a large well 41 ft. by 23 ft., the room attains a height of 19 ft.; the floor area is 13,500 square feet. The decoration is in the Louis XVI. style, and the woodwork is in panelled mahogany and painted grey, the whole being enriched with carved ornament, and a beautiful arrangement of pilasters and columns in stuc marble *jaune de Sienna*. The capitals and bases of the columns and pilasters are of the Ionic order.

Between the pilasters and on the panels of the vents decorative paintings of various sizes are hung. Twenty of these are after arabesques by Prieur, a famous decorator of the Louis XVI. period (1774-1789), supporting *Salles* decorated with bas reliefs in *grisaille*, inspired by the works of Clodian and Huet, masters of the eighteenth century.

Two grand decorative paintings, fore and aft of the funnel casings in the centre of the ship, are hung above two majestic sidetables with marble tops. The foregrounds of these paintings represent Ionic architecture, decorated with garlands of flowers and attributes, through which are seen perspective views of landscapes taken from the parks of the Grand and Petit Trianons at Versailles. Four lesser panels are found at each side of the funnel casings; these represent other views in the same parks.

In the great ceiling of the well is a decorative painting forming a grand central portion, representing the triumph of Flora. Flora, on the highest clouds of a radiant sky, is receiving the tributes of the other goddesses, eager to assert her triumph. Pomona, with a brotherly action, takes her hand and adorns her breast with a branch of apple blossom. Ceres offers her a bouquet of wild flowers, while young lovers weave a garland of roses. Cupid, with a flourish of his wings, carries to her the crown which is to perpetuate her glory.

This subject is framed by four fine ecoinsons, composed of brûle parfums, arabesques, and garlands of flowers and fruit, and at each extremity of the ceiling are two circular portions, bound by a border representing a spray of roses.

On the transverse bulkhead are chimeras of women's heads. All the ornamentation, wreaths, garlands, &c., are inspired by the best masters of the eighteenth century. The well is surrounded by a rich wrought iron balustrading, with motifs forming panels representing the monogram of the company and of the ship, with two anchors crossed on a trident, symbolical of Neptune, the god of the seas. The carpet of the restaurant is blue. The furniture is of satinwood, the coverings being of blue ground silk with chints colours. The curtains are of yellow moirée.

The general idea in the first-class smoking-room has been to retain a ship effect with architectural propositions. It is an adaptation from Greenwich Hospital, the period being late Charles II. The panelling is of solid oak. The chimney-piece, with its marble surround and carved ornaments, is a typical adaptation of the work of the period. The plan of the room generally is interesting. It is 76 ft. long and 52 ft. wide, with a lofty central portion and fine spacious rooms adjoining, divided off by glazed and panelled partitions, with oak carvings of nautical trophies and draperies. On all sides will be seen carved trophies and coats of arms, which are both varied and interesting. They are in the earlier manner of Grinling Gibbons and embody the typical nautical attributes frequently used by him. To retain the robust character associated with the "Wooden Walls" of England, much of the carving has been executed out of the solid oak. The more important features, however, such as the large drops of carving on the chimney-piece, have been executed in limewood and applied upon the darker oak ground.

The trophies of arms in the windows contain shields of the various heraldic devices of the principal British ports executed in the correct colouring. The carved and gilded sconces, discreetly apportioned to the several compartments of the room, are specially designed to harmonise with both the period and the nautical tone of the whole scheme. The massive silver andirons are faithful reproductions of the original examples existing at Knole. The floor is composed of oak deck boards of random widths, as used in old men-of-

Digitized by Google

war. The central portion is covered with a fine old hand-made carpet of Persian design.

In the centre of the high portion of the room are two large decorative painted panels, in richly carved old gold frames. These are after Claude (Gelée Lorrain) and represent the "Embarkation of St. Ursula," and a "Seaport with Figures." The originals of these are in the National Gallery. Over the mantelpiece is a fine portrait of James I. The lower portions of the room, adjoining the central hall, have a rich oak beamed ceiling, and the window treatment suggests the admiral's walk on an old battleship. Most of the carved trophies and details there have been copied from old ships at Greenwich, notably the *Sovraigne of the Seas*, built at Woolwich in 1637, and the largest ship of her period. She is said to have been designed only for splendour and magnificence, her bulwarks being covered with carved and ornamental trophies in panels. The electric light fittings in this portion of the room are copied from a design of an old Dutch ship lantern. The whole of the panelling has been toned down to an antique mellow hue.

The chairs and settees are in English walnut, being reproductions of old models of the period, and covered with "Petit Point" tapestry. In the centre of the room are two remarkable carved console tables with marble tops.

The general scheme of decoration which has been chosen for the first-class lounge is that in vogue about the time of George I., and is reminiscent of the work of Sir Christopher Wren. The colour scheme is wine red and vellum. The columns and entablature support a wagon-headed ceiling, which is embellished with plaster work of the latter half of the seventeenth century, the details being in each case from original models. The centre of the room, which is 18 ft. in height, is ornamented with a genuine old ceiling painting on canvas, representing an allegorical subject, and signed by Van Cuygen, a well-known decorative painter of the Dutch school. It will be interesting to note that this undoubted work of art was removed in its entirety from a house of the period. The room has large Georgian windows overlooking the garden lounge. The spandrels at the end of the room, on each side of the arches, are copied from old panels representing the elements, "Fire," "Earth," "Water," and "Heavens," after Jean Baptiste Van Lee, 1684-1745. The lunettes in the cove above the cornice are fitted with wrought iron grilles copied from old models, evidently inspired from the work of Jean Baptiste Tijou, the world-famous artist-craftsman of the time.

The carvings surrounding the picture over the chimney-piece and niches are of limewood. They are fine examples of modern work, each swag and pendant being actually carved out of one block of wood without joints. These carvings, which represent marine attributes, were copied from genuine examples by Grinling Gibbons (1648-1721), who founded the great school of English woodcarvers in the seventeenth century, and whose work, both for delicacy of execution and technique, remains unsurpassed. The finely moulded marble jambs surrounding the fireplace opening are of rare and beautifully figured "Breccia Africain" marble.

A semi-circular stage or platform is planned at one end of the room, decorated with a fine coffered vault, under which is a reproduction of the famous tapestry representing the Battle of Solebay. This is a Mortlake tapestry, and the original is in the Prince of Wales' bedroom at Hampton Court Palace. The tapestry in question provides a good illustration of the battle, and shows the position of the allied fleets at dawn, moored in a curve parallel to the coast-line, in which may be seen the village of Southwold. To the north are the English squadrons under the Earl of Sandwich; in the foreground lie the French vessels under d'Estrees and Duquesne. To the right is the rising sun, and west of it is the Dutch fleet. After twelve hours of stubborn combat the battle ceased, each side claiming the victory. The ceiling is lit by a hidden electric lamp, two fine carved alabaster dishes, and a number of graceful fittings composed of crystal shells and motifs suggesting the sea. The floor is of oak and suitable for dancing. It is covered with plum-coloured trellis carpet, the centre being a replica of a fine Savonnerie example. The furniture is composed of reproductions of some of the best examples of the period, covered with needlework tapestry, Genoa velvets, and rich brocades. The long gallery stretches for nearly 150 feet—from the first-class smoking-room to the lounge. On the port side large sash windows overlook the deck promenade and the sea. The walls are panelled in mahogany and are painted a delicate eau-de-nil. The whole is reminiscent. The period of decoration is about 1780 and the black and grey tiling of the floor harmonises admirably.

This gallery or arcade is essentially a place where passengers may promenade, or rather stroll, for its beauties are so varied that leisure is necessary to examine them. Prominent amongst its features are the vitrines or show-cases, which contain exhibits of jewellery, china, lace-work, prints, and other objects of art. These, in themselves, would be of sufficient interest to establish the unique character of the gallery. But just as vital to the scheme are the magnificent prints which adorn the walls, making it not only a gallery of art, but one of history as well. Particularly appropriate are the old prints of English seaports in the early part of the eighteenth century. Liverpool, the birthplace of transatlantic steam navigation; Deptford, where the "goodlie shippes" of the sixteenth and seventeenth centuries were built; Greenwich, with its Royal Hospital for Seamen; Plymouth, one of whose indissoluble links with the new world is the *Mayflower*; Bristol, the home of Sebastian Cabot, and of William Penn's father; and Harwich, which witnessed the stirring scenes of the Dutch Wars.

The more personal side of eighteenth-century history is represented by the admirable series of engraved portraits, such as that of Prince William Henry, third son of George III., who visited New York in 1781-82; that of Nelson, the international sea-hero; and those of Handel, Samuel Foote, David Garrick, John Kemble, and Edmund Kean, whose art knew neither the bounds of time nor space.

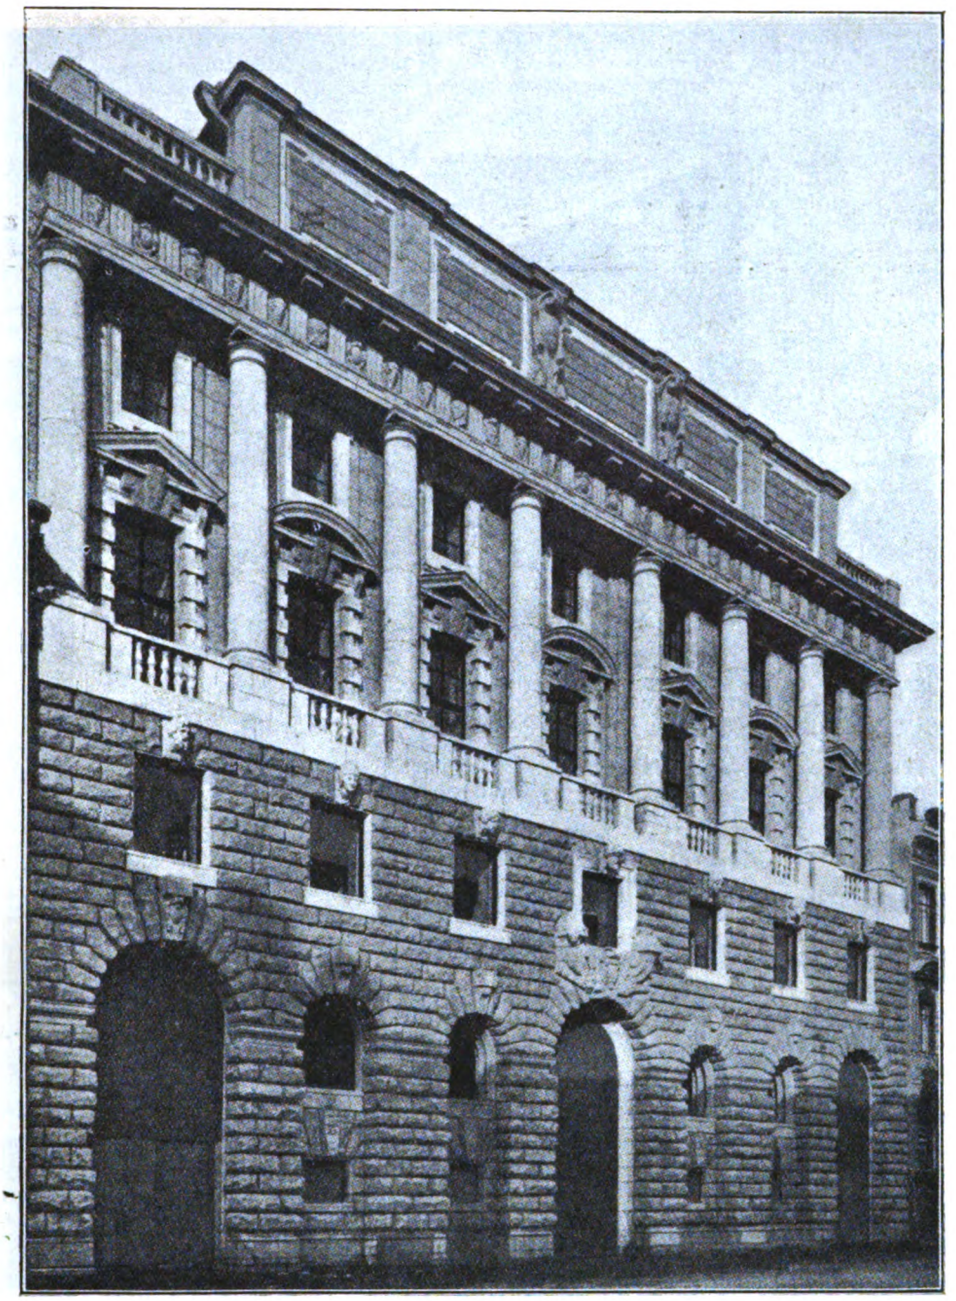
LEEDS AND WEST YORKSHIRE ARCHITECTURAL SOCIETY.

A GENERAL meeting of the above Society was held at the Leeds Institute, Cookridge Street, on Thursday, February 18, when a paper on "Wren" was given by Mr. J. H. Farrar, A.R.C.A. (Lond.), illustrated with lantern slides. The President (Mr. G. Fredk. Bowman) occupied the chair, and there was a good attendance of members.

The lecturer, in the course of his remarks, dealt rather upon Wren's personality and his place in history than the range and quality of his works.

Members of the Wren family had served in spiritual and temporal offices to the Crown as early as 1500. Matthew Wren, Lord Bishop of Ely, and his brother Christopher, father of the immortal Sir Christopher, both suffered persecution at the hands of the Long Parliament, Bishop Matthew being confined in the Tower of London for eighteen years until the Restoration. It was for this same Matthew Wren, as President of Pembroke Hall, Cambridge, that Christopher carried out his first architectural work—the new chapel there. He was then over thirty years of age. Up to this time he had applied himself chiefly to scientific pursuits, having been Professor of Astronomy at Gresham College, London, and at the University of Oxford. He was skilled in mathematics, and a prolific inventor. It was during the year of the Plague that Wren made his only visit to the Continent, when he journeyed to Paris to a Congress of Arts. Here he met Bernini, who was at work upon the Louvre, and Mansart and Perrot. After a stay of six months he returned to England, and in the following year the Great Fire swept away the mediæval town of London and presented to Wren the opportunity for the creation of a new and beautiful city.

Unfortunately, the parsimony and stupidity of those under whom he had to work prevented most of his dreams from complete realisation; but, despite his limitations, by skill and forethought he converted London from a stuffy, plague-ridden city of the Middle Ages to an airy, modern town of brick and stone.



The lecturer went on to analyse the details of Wren's great task, more particularly with regard to the controversy as to what was to be done with the gutted St. Paul's; how he triumphed eventually over his critics, and completed his new church within forty-five years from the date of the Fire.

Wren's last five years were spent in quiet retirement at his house, near Hampton Court, where he died, after a short illness, at the age of ninety-one.

A vote of thanks was accorded to the lecturer on the motion of Mr. W. G. Smithson, A.R.I.B.A., seconded by Mr. J. G. Coombs, A.R.C.A., and carried.

At the conclusion of the lecture Mr. Bowman presented Mr. Farrar with a silver tea-service from the members of the Sketching Club on the occasion of his recent marriage.

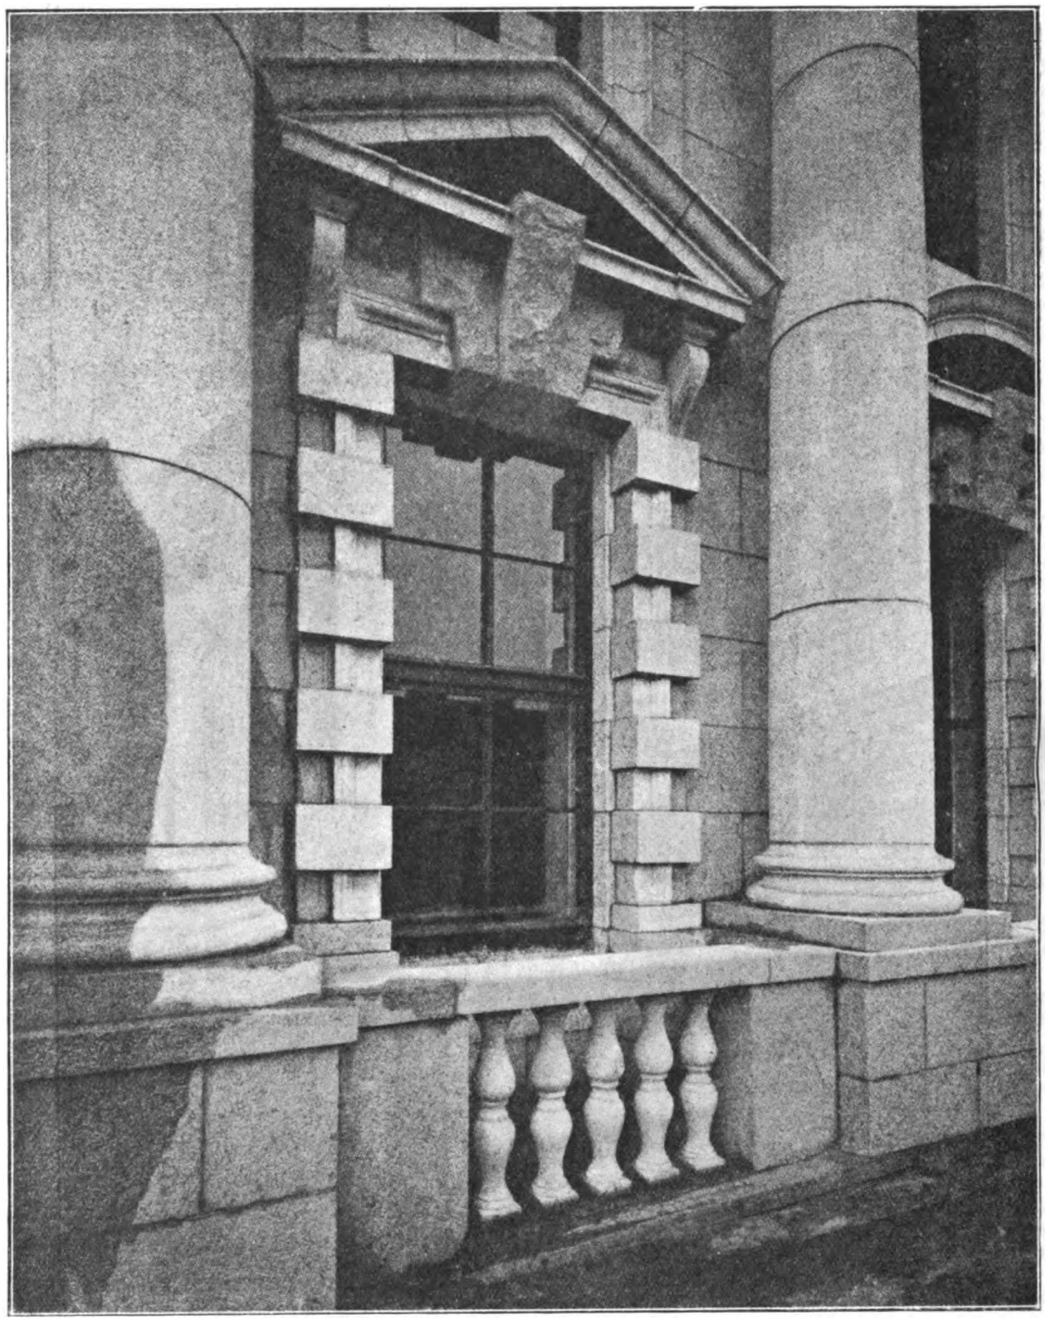
PETROGRAD.—THE RUSSIAN COMMERCIAL AND INDUSTRIAL BANK.—M. PERETIATKOVITCH, Architect.

NEO-CLASSICISM IN RUSSIA.



THE revival of the classical style in modern architecture may appear little short of a paradox. We hear it so often denounced as an obsolete relic of the past retaining its pernicious hold over the present only by reason of our æsthetic apathy and conservatism. And side by side with these denunciations we see many present-day erections, modern to the last degree in their purpose and character, which find their most fitting expression in this same classical style notwithstanding all its proclaimed obsoleteness. Obviously there must be something wrong with these sweeping criticisms, and it may be that the obsolete is not so obsolete and the modern not so modern. Whatever is the truth, the opinion of M. Loukomsky, the gifted Russian critic of architecture, merits our special attention in this connection, for not only is he a lover of classicism, but he even believes that it is actually the only form fully answering the requirements of modern architecture.

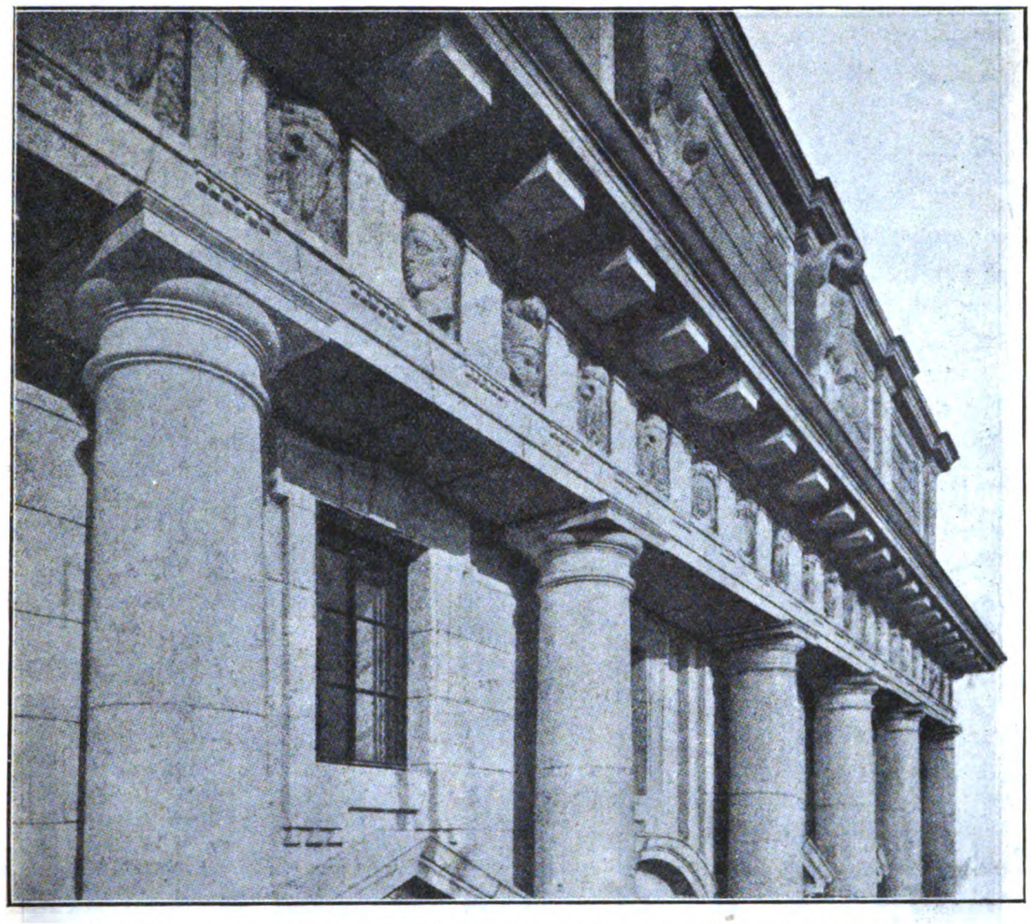
In his second article in the "Apollon" on the latest architectural developments in Petrograd (his first article was reviewed in these pages last year) he emphasises the fact that, whilst painting and sculpture show a marked tendency to break off the traditions of the past, architecture, after its brief wanderings in the fanciful world of the "new-art" style, has come back to its favourite forms of the classical tradition. This statement seems to be fully borne out by the sequence of architectural movements in Petrograd during the last decade.

The first signs of reaction in Russia against the "new-art" and towards the "classical" manifested themselves in the revival of the "Empire" style. This was soon followed by the influence of the late Italian Renaissance, to come finally under the sway of the Early Renaissance and, partly, of the ancient Greek. The numerous erections of last year, reviewed by M. Loukomsky, are fairly representative of these various tendencies.

Perhaps the most characteristic building amongst them all is the Russian Commercial and Industrial Bank, designed by M. Peretiatkovitch. It has a heavily rusticated plinth and first storey, carrying a light colonnade of the Doric order which supports an elaborately modelled cornice. The three elongated arches in the plinth serving as entrances do not lack in accent, though, on the other hand, the arched windows seem to be so small as to produce a dwarfing effect. The design of the windows of the third floor with their quoined mouldings is rather uncommon in Russia, and it is curious to note that it called forth some criticisms charging the architect with borrowing the *motif* from a building standing opposite the Bank. Of course, the truth of the matter is that this design is one of the stock *motifs* not

Digitized by Google

PETROGRAD.—DETAIL FROM THE RUSSIAN COMMERCIAL AND INDUSTRIAL BANK.—M. PEBETIATKOVITCH, Architect.



unfrequently employed by the builders of the Early Italian Renaissance and is well known in this country also. The effect of dignity and grandeur obviously aimed at by the heavy rustication of the basement is somewhat marred by the fact that the building is in a line with other houses in a narrow street and consequently stands too close for the passer-by to get a general view of it. Owing to the same factor the proportions of the upper part, and of the colonnade in particular, lose considerably through being seen in sharp perspective. Obviously to remedy this effect the architect imparted an added emphasis to the cornice, which is magnificently worked out, with beautiful sculptured metopes in the frieze.

Another example of the classical tendency is supplied by the detached private house designed by M. L. Ilhin. The building retains some familiar features of the Russian Empire style, particularly in its wall ornaments, but otherwise it is essentially Palladian, though coloured with the homely character which is so peculiar to the old Russian country houses. Its details are finely worked out (*e.g.*, the composite order of the capitals), whilst what may at first appear as a discordant element breaking the unity of the design, viz., the left wing, on further examination appears to accentuate the residential character of the building, softening down the solemnity of its portico.

Of the other buildings reviewed by M. Loukomsky we give here illustrations of the more interesting. The house designed by M. Niedermeier is a pleasing example of the use of classical forms, though it is less original than the two houses just described. Through its two bottom storeys there runs an arcade in the Doric order, whilst the upper part is treated in the Baroque style. Perhaps the combination is not one of the happiest, but nevertheless the calm dignity of the whole, which is partly due to the unusual reserve of the Baroque of the upper storeys, gives one the impression of power and individuality.

More faithful in its classicism is M. Rosenstein's house, designed by M. Bielogrud. It is full of Palladian forms, amongst which the most striking is the *motif* of a broken-up cornice making room for an extra storey. This *motif* was used by Palladio in his Casa del Diabolo in Vicenza, and was only recently applied in Russia by M. Stchuko in the magnificent house in Kameno-ostrovsky Prospect, a photograph of which was reproduced in these pages last year. Another feature of interest in the house designed by M. Bielogrud is the prominence given to its sculptural ornamentation. A number of statues on the top of the attic storey and the archaic sculpture in the frieze, running on the level with the richly modelled composite capitals, give credit to M. Rasoumovsky, their author, and may be regarded as one of numerous examples of the reviving in Russia of interest in sculpture as an architectural form.

PETROGRAD.—DETAIL FROM THE RUSSIAN COMMERCIAL AND INDUSTRIAL BANK.—M. Peretiatkovitch, Architect.

Quite by itself, distinct from the above classical buildings, stands the house designed by M. Lialevitch. It has an imposing front boldly divided into parts by a pediment of original design. The two statues crowning the entablature are placed in well chosen positions, and the frieze crowning the rusticated storeys adds to the generally pleasing effect produced by the building.

ROYAL ACADEMY LECTURES: ARCHITECTURE.—III.

The third of the four lectures on "The Thousand Years of the Flemish Arts," which Professor E. S. Prior, M.A., A.R.A. concluded last week before the students of the Royal Academy, was concerned with

THE ARTS AND CRAFTS OF THE FLEMISH RENAISSANCE.

In his first lecture, describing the Romanesque Arts of the Low Countries, Professor Prior had mentioned their descent from the Carlovingian craft schools. The twelfth and thirteenth century metal-workers of Dinant and Tournai, with bronze fonts, bronze sepulchral slabs, and with their magnificent coffer chests, joined with the marble sculptors of Tournai in handing on to Flemish style a traditional capacity for a trade in the object-works of the imager and goldsmith. Both by reason of its efficient crafts of marbler and metal-worker, and by having at hand the materials for splendid and showy work, the Flemish country could supply elaborate tombs, screens, and retables; and, indeed, no other European country, except Italy, could compete in such things with the Low Countries. Towards the end of the fourteenth century the remarkable fact appears that in many of the great centres of European civilisation the records of cathedrals and churches disclose the names of Flemish masters as employed on works of important sculpture. For instance, the effigy in Westminster Abbey of Edward III.'s Queen Phillippa was sculptured by Hawkin of Liège. At Narbonne, close to the Pyrenees, as well as at Abbeville in Normandy, at Troyes, and in Paris itself there are similar records of Flemish artists.

Dijon, the native capital of the Dukes of Burgundy, is famous as the site of the most celebrated monuments by which the era of Flemish style was heralded. Here it was that c. 1400 Flemish art created a new Gothic style that became of wide decorative use throughout North Europe in the works of men like Claus or Nicolas Sluter. The size and the bold modelling of its sculpture and the sumptuous use of black-and-white marbles are altogether foreign to English style, as they are to French. Another form of rich monumental stone furniture in which the quality of Flemish style declared itself was the wall-monument enriched with individual sculpture.

The elaborate sculpture was of many kinds in the architectural compositions with which the Flemish furnished their churches. In their bold magnificence of scale and their lavishness of figure-work these Flemish stone pieces of the fifteenth century surpass all other examples of mediæval church furniture of the date that have come down to us. It is when such pieces remain in their original stations in the churches for which they were made that their effect as art is so telling. A great deal of the fifteenth-century furniture has of course perished. But till this year splendid pieces remained in the churches at Hal, Lèau, and St. Peter and St. James at Louvain.

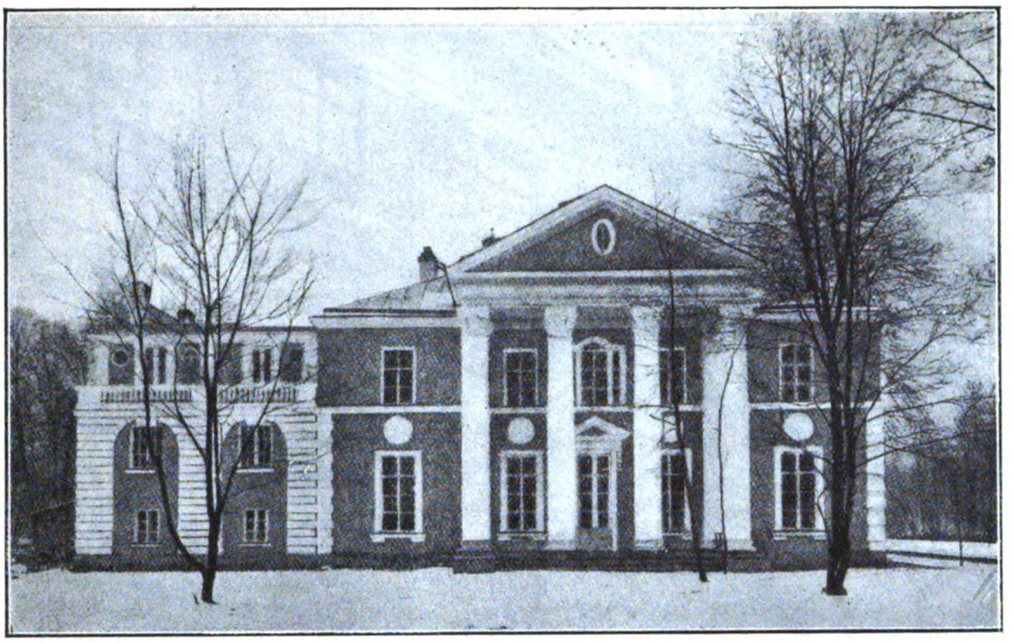
At Lierre was one of the most exquisite of these screens, executed in white stone, suited for the delicate carving. The black marbles of the Ardennes were employed for the columns—one of the earliest uses of the natural colour in architectural compositions. These elaborate chancel screens came into use during the second half of the fifteenth century. As in our cathedrals, the common use of these rood lofts was as the station for the music of the choir and services. This instrumental music in the sixteenth and seventeenth centuries gave place to the organ, so that rood-loft screens ordinarily became organ-lofts in the sixteenth century. Such picturesque erections enhance enormously the effects of architecture: they give perspective. There were remaining till this year six splendid examples—Louvain, Lierre, Aerschot, Dixmude, Tessenderloo, and Walcourt.

The chapel screens were works of similar picturesque luxury, whether in painted wood or wood and bronze.

Digitized by Google

DETACHED HOUSE IN PETROGRAD.—M. L. ILHIN, Architect.

They have been wrought, fretted, chased, and polished, all combining by their natural colourings to produce those warm, rich textures which are the arts and crafts equivalent of the splendour of painting. The screens had their counterpart in the splendid domestic pieces of internal decoration in which wood, stone, and metal combine. The Flemish chimney-pieces, the enriched doorways, and the panelled ceilings make compositions of peculiar beauty.



The sculpture of pictures in stone and marble was echoed in wood. In the Flemish wood-carving artists there practised some of the most accomplished craftsmen that the world has produced. Indeed, wood made a material in which the peculiarly Flemish character of its fifteenth-century figure art was exhibited. Oak and walnut were used for the elaborate carving of scenes of pictorial relief backed by architectural ornament, traceries, canopies, and all the varieties of tabernacle work, and framed up into great erections of monumental effect.

As picturesque composition, relying on the intricate play of decorated line, on the glitter of varied surfaces, and the interest of complicated effects, the arts of the Antwerp retable-makers captivated Northern taste; and of all the Flemish productions their story-telling retables had probably the widest diffusion. What was in competition with it in the early years of the fifteenth century was the English alabaster retable which in rivalry developed as an erection of many tiers, but never succeeded in giving the same luxuriant fulness of design as the Flemish productions. By the end of the fifteenth century the Flemish wood retable had ousted from European commerce the English alabaster make.

The decay of the English church arts of sculpture was consummated by the English Reformation. On the other hand, the middle of the sixteenth century became the culminating period of the Flemish commerce in church furnitures of all kinds. They were taken to all Catholic countries and spread the Flemish style all over Northern Europe. The skill of the wood-carvers and their conception of bold and splendid decoration has a wonderful example which exhibits its beauties on two faces in the wood pendant hung in the church of St. Gertrude at Lèau. It is 10 feet high and is suspended in the middle of the nave.

Accompanying this architectural woodwork there was a large amount of portable furniture—both important pieces of ecclesiastical use and also domestic furniture in the houses of princes and great merchants of the fifteenth century, whose wealth and display equalled that of the princes. Flemish furniture set a style to the house-wrights of Northern Europe. They introduced the joiners' habit of panelling rooms, and so initiated a style of domestic decoration that only after a long interval succumbed to Palladian influences. The richness of the wood ornament is echoed in the most beautiful ironwork of the lock plates and hinges. Indeed, combinations of woodwork and metal-work in one composition produced the most picturesque effects in Flemish churches in the chapel and chancel enclosures and the many screens and partitions. Both bronze and iron are used in architectural display, but also for great pieces of metal furniture. The most famous are the fonts at Hal, Louvain, Diest, and Ypres. Continuing the arts of the twelfth and thirteenth centuries, we have in the fourteenth century the great bird lecterns, the earliest

of which is said to be that at Aix-la-Chapelle. There remain in many churches splendid examples of fifteenth-century bronze and copper work in fonts, lecterns, and church candlesticks.

A distinct crisis in the arts was occasioned by the wars of religion. The dividing line is marked by the departure of Philip of Spain in 1550 in dudgeon at the turbulence of his Flemish inheritance. That turbulence culminated in the iconoclastic riots of 1566 which assailed the churches of Flanders. There followed the reprisals on the Calvinists by the Spanish Governor, the Duke of Alva. In the five-and-twenty years of these tumults a very large part of the splendid fifteenth and early sixteenth century monuments and screens in the Flemish churches were destroyed. And when in 1579 was achieved the separation of the seven provinces by the Union of Utrecht the Protestant population of that part of the Low Countries which we now call Holland developed a national art outside the Catholic southern provinces which remained under the dominion of Spain. But in the southern provinces, which are those we now call Belgium, there was a renewal of Flemish prosperity. The new generation had in the interval discovered new principles of decorative design.

Towards the end of the sixteenth century pageant designs and the patterns of decorative objects, which were published in books, aimed at a fresh standard. The modelling of furniture began to be divorced from construction and relied for effect on an arbitrary feature of design. The outstanding and conspicuous sign by which we may identify the control of Flemish art passing into the hands of the Renaissance sculptor was the adoption of those settings and accessories of sculpture which we know as Classic.

The most continuous output of the sculptor-shops were concerned with the monuments to the dead. In these competition between various makers and the sculptor-shops of various cities tended to an easy Italianising of detail. In the great marble altar tombs Flemish style is most assertive of its own genius. The wood carvers were not behind the marble sculptors in exploiting Renaissance detail for great pieces of furniture. Of all wood sculpture the organ cases seem the most ambitious, comparable in elaboration and scale to the tabernacles of the marble sculptors. In its less ambitious enterprises the wood craftsmanship of the middle of the sixteenth century had a refinement and simplicity of treatment that exhibits furniture makers more as constructive artists than competitors of the marble sculptors. Well on into the seventeenth century we recognise in the internal fittings of the great houses the same quality of artistic craftsmanship. Much Flemish furniture is to be dated to this first Renaissance of wood design, in which the Renaissance ornaments replace the Gothic traceries, but they are carried out on a craftsman's system of enriching but not disguising construction.

The Catholic art of the counter-Reformation in North Europe owed its effective power to the necessity imposed on it of being in immediate contact with the Roman art of Italy—the art that was Roman in being papal and Roman, too, in being classical. In this conjunction were effected those fusions of Catholic sentiment with classical forms that lasted as the expression of European art for three centuries, dominating even the Protestant idiosyncrasies. It was the Catholic competence of this fusion that endowed so splendidly the Jesuit architecture in Flanders. In Italy and Spain churches have a full representation of this Baroque furniture and decoration of the seventeenth and eighteenth centuries. But north of the Alps and the Pyrenees there are no such displays so picturesque and boldly conceived as in the Flemish churches.

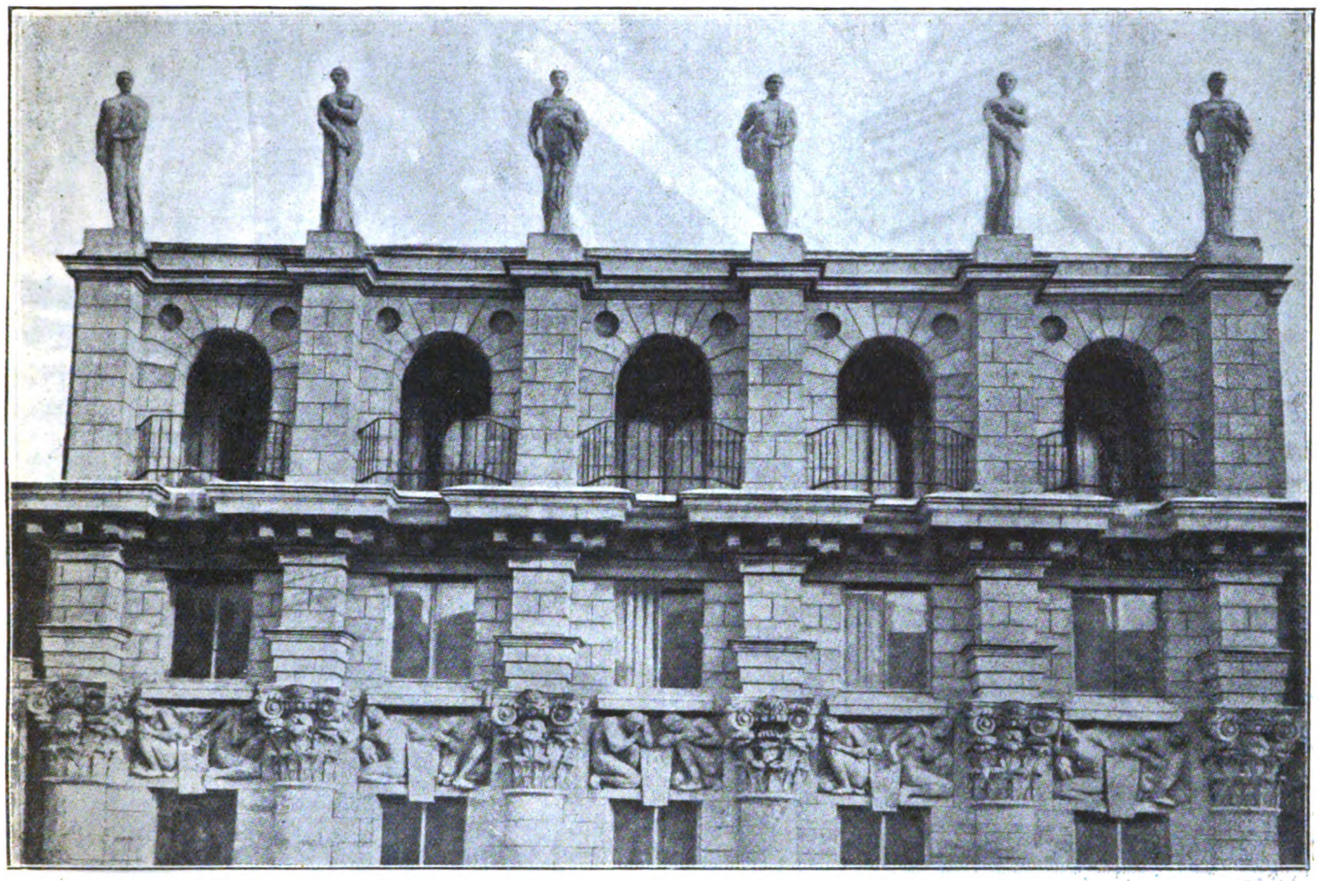
Though plainly scenic in its intention, the art of the early seventeenth century shows often great propriety of composition, and is always wonderfully happy in its choice of decorated materials. But later sculpture and ornament were to grow apart from one another.

The characteristic qualities of the eighteenth century developed in the Flemish wood sculptors as can be seen in the great carved pulpits, which, though constructed of wood, are more wanting in sense of constructive carpentry than any woodwork on such a scale in the world. These pulpits are to be found at Bruges, Antwerp and Louvain, Brussels and Ghent. Of the two at Antwerp, that at St. Andrew's, representing the calling of St. Peter and St. Andrew, is the latest, about 1760; and as far as the imitative pictorial sculpture can go is of extraordinary spirit and vivacity.

THE RESTORATION OF WESTMINSTER HALL.

THE restoration of Westminster Hall was raised in the House of Commons on Thursday last week on the vote of supply.

Mr. King, who said he wished to call attention to a matter of immense importance, said: A policy is about to be started which, I am quite certain, if put through, will give a great amount of offence to the best judges and cause deep regret for many years to come. The roof of Westminster Hall is, as we have been aware for ten months, in a condition that needs repair. I do not for a moment question the necessity of doing something very extensive in its operation to the roof of this great hall, but I specially want the members of the House to realise that the most sacred secular building in the whole of our history, and I therefore think in the history of the world, is going to be radically changed and altogether altered as a structure, and there has been no debate in the House on this important matter since April 23 last. On that date there was a debate, it is true, but it was a debate on the Vote for the Houses of Parliament. It began after half-past



Digitized by Google

PETROGRAD.—M. KALMEIER'S DIVIDEND HOUSE.—M. A. NIEDERMEIER, Architect.

seven, and it was interrupted by a Private Bill, which took nearly the whole of the evening. The discussion, therefore, was most inadequate, and admitted of nothing but one long speech from Mr. Wedgwood Benn. It is a very curious thing that in this debate the plan of the Government was enunciated, and it was not until more than two months afterwards that the report upon their investigations of the actual proposals of the Government was given. The House is therefore asked to consider itself as having debated a subject on April 23 which was only laid before it on June 13. When the report was laid before the House a request was at once made to the Prime Minister that a day should be given for the discussion. Before a definite answer was given Mr. Wedgwood Benn announced on June 25, less than a fortnight after the report was issued, that the whole of the recommendations were being adopted, and that therefore there was to be no discussion of them by the House. I want to call the attention of the House that the gentlemen on the Treasury Bench have not treated us fairly. If it had not been that this report was published only just before the extremely exciting time of party conflict, and the threat of public riot and revolution which we had at the end of June and in July, and if that had not been followed by the outbreak of the war, there would be by this time an overwhelming body of public opinion against this report and the proposals. I am certain we should have had by this time a Committee of Inquiry and counter proposals, and I am confident we should have had a different solution of the problem of this roof at very much less public expense. If the Government will allow a committee to be appointed to look into this report, examine witnesses, and report again before the actual structural work was taken in hand I should be satisfied, and I am confident that the result would be that we should have a different roof from the extravagant and outrageous proposal that is being made. What is the recommendation of this report, and what are my objections to it? I hope that if we cannot get a committee or further inquiry we shall, at any rate, get an opportunity when the whole matter can be discussed. I hope the hon. member who is to reply will undertake that the work of vital and decisive character will be kept back until after that discussion. If he gives that undertaking I shall be satisfied. I admit that the roof needs repair, but the proposal is to put up a huge iron structure from which the existing roof will be more or less suspended, so that the roof, as we shall see it, will not be the structural roof at all, but pieces of timber repaired by new timber; but it will not carry the weight of the roof,

Digitized by Google

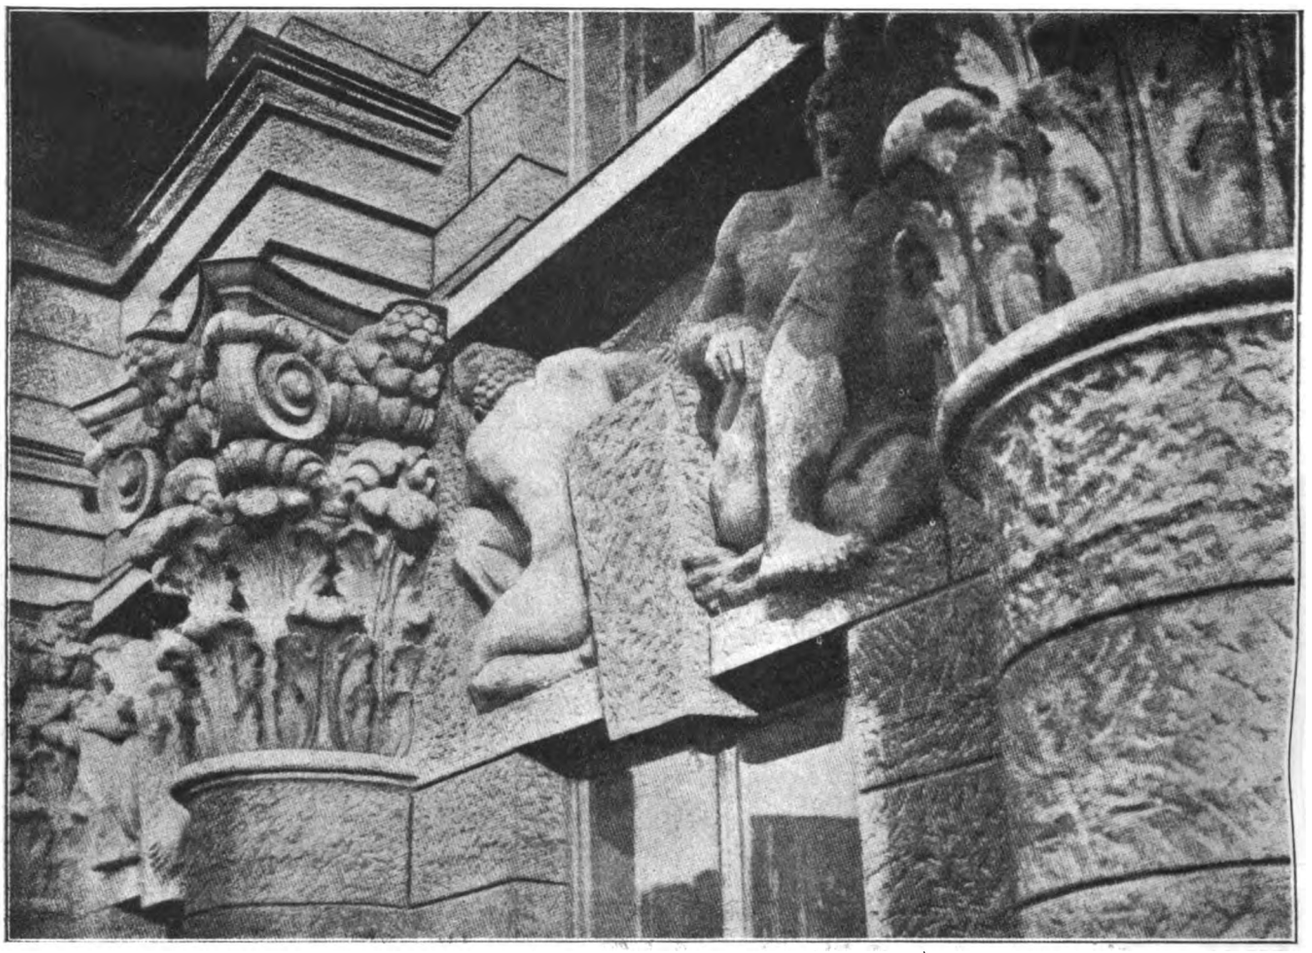
PETROGRAD.—DETAIL FROM M. ROSENSTEIN'S HOUSE.—M. A. BIELOGRUD, Architect.

and it will not support the slates or whatever may be the material adopted. It will be a structural sham. It will be no more the real roof of the building, but only a certain number of ancient timbers. I object altogether to a great historical building, probably the noblest Gothic building in the world, being treated in that way, and I object to advantage being taken of this war to commit an act of artistic vandalism. The first point I want to raise is that opinions have been strongly expressed against this report from different points of view. The report of Mr. Baines—I do not wish to say anything disrespectful of him, for he is a friend of many members, and he is a very capable man with regard to the actual construction and power of an iron roof; as an architectural engineer he is, no doubt, an excellent and first-rate authority, and I do not doubt that the roof he proposes to put up will be strong enough. If we are to have an iron roof from which the present timbers will be suspended, I am willing to agree that Mr. Baines will carry it out very well. Some men of science have already expressed doubt of the wisdom of this course. I have a letter from Professor Stebbing, of Edinburgh University. He is Professor of Forestry in that university, and he is a great authority not only on timber, but on the ravages of insects on timber. I wish to refer also to the fact that the hon. member for Cambridge University has expressed in the *Times* that further inquiry and discussion are necessary before this work is undertaken. These are only two men of science I could quote. This is not an ecclesiastical building, but it is the greatest building of a secular character in London. I will quote Mr. Lynam, who is one of the best-known antiquarian architects. He says:—

"This is vandalism, and we ought to draw our swords against the vandals as against the Huns."

That shows he feels pretty strongly about it. I have a communication from Mr. Caroe, the architect to the Ecclesiastical Commissioners, who has been connected with the repair of most of the cathedrals of the kingdom. He knows the subject of these great Gothic roofs better than any other architect in the kingdom. He has not been consulted. There was no attempt to approach him in connection with the Office of Works. If we had a committee we should be able to approach men who know the subject. Mr. Caroe was articled to Mr. Pearce, who placed the roof of Westminster Hall in its present condition. He was, for seven months, every day on the scaffolding of this roof, and he has had an experience of the roof which is absolutely unique. He was never asked a single question on the subject. That shows how the Office of Works goes to work. It simply blunders through its officials. Engineering opinion is not favourable to the making of Westminster Hall a great work of engineering, rather than of architecture. I wish to quote what the "Practical Engineer" said only in its last issue:—

"It is now intended to practically build a new roof of steel girders behind the wood and out of sight. For the authors of this proposal some term stronger than semi-criminal is required. Better a naked and unashamed steel roof than the imposture which has been decided upon."



I am going to quote a practical man—the House is full of them now. I suppose the practical man who knows more about these great timber roofs than any other is Mr. Gaymer, of Messrs. Cornish & Gaymer, the firm who are now reconstructing Durham and Canterbury Cathedrals. They have enormous stocks of old timbers, and they are one of the two or three firms who undertake such work as the reconstruction and repair of our great cathedral roofs. Mr. Gaymer was engaged as a young man some years ago in connection with Westminster Hall, and his firm have made an estimate of the cost. Mr. Gaymer has made a firm offer that he would do the work for £49,500.

Mr. MacVeagh: Would he do it on commission?

Mr. King: It is a firm estimate—not on commission. The proposal of Mr. Baines in his Blue Book is for £60,000—£11,000 more. That was a pre-war price. That was an estimate of a gentleman drawing up his own proposals, and naturally not putting them at the highest possible figure. Therefore we should save £10,000 at least by repairing the roof with timber rather than by putting on a new superstructure of steel. I believe that there is undoubtedly a case for delay and further inquiry before this most historic and noble building is transformed from what it is—a grand specimen of Gothic architecture—into a mere sham of modern engineering.

Replying on behalf of the Government, Mr. Beck referred to the fact that Mr. Wedgwood Benn arranged for

Digitized by Google

PETROGRAD.—DETAIL FROM M. ROSENSTEIN'S HOUSE.—M. A. BIELOGRUD, Architect.

personally conducted tours of members of the House of Commons to go over the roof of Westminster Hall. Further than that, he continued, before Mr. Baines' most able scheme was adopted, the Institute of British Architects and the Society for the Preservation of Ancient Monuments were consulted, and if time permitted it would be easy to bring the names of ten firms to bear against the one quoted by my hon. friend. The fact is that it is too late. A definite contract has been entered into for the carrying out of the work on the lines proposed by Mr. Baines. The House has had one of the most able statements of that sort which was ever written placed before it by Mr. Baines. The matter was urgent, because we were told by those who are capable of judging that it was almost a miracle that this great and wonderful roof, one of the glories of British architecture, continued to exist at all, so decayed and eaten away was it. Therefore it was felt that not a moment was to be lost in the work of safeguarding it for many generations. Though I am most anxious to meet my hon. friend in any possible way, there is no possible way on this occasion, because the contract has been placed, after consultation with all the people who are capable of judging, and the great consensus of opinion was in favour of the plan adopted.

THE ELECTRICAL EQUIPMENT OF A COUNTRY HOUSE.*

By FREDERIC H. TAYLOR, Assoc.M.Inst.E.E., Assoc.M.Inst.M.E.

THE importance of the electrical equipment of a country house can, I think, hardly be overrated. In a town house electricity plays a most important part, but in an isolated position in the country its extent and its usefulness become considerably greater.

Although, perhaps, the greatest duty entrusted to electricity in the house is lighting, it is, even in comparatively small residences, called into service over many others, such as heating, motor drives for domestic machinery, electric bells and telephones.

Leaving aside for a moment such parts as bells and telephones, it may be said that all other equipment in the country house is such as requires a power plant for its operation.

Power.—For this purpose plants of various descriptions are in use: Water-power, and steam-power for installations of considerable magnitude, and suction gas, or paraffin engines for plants of more moderate dimensions. It is plants operated by the last-mentioned means to which I am particularly referring to-night, as these represent by far the largest part of the installations of the last few years. They have long since been obtainable in sizes from 1-2 K.W. to about 12 K.W., by a host of makers, and generally are very reliable in character. This commonplace paraffin-electric set, together with the use of metal filament lamps, has entirely revolutionised country house lighting both as regards prime cost and running cost, quite apart from the many other and equally important uses quite different in character to that of house lighting.

One of the greatest recommendations which such a plant has for its purpose lies in the fact that it can be put into the hands of unskilled labour and yet be relied upon to give satisfactory results. Commonly it is the chauffeur, gardener or odd man on whom devolves the duty of running the plant; the first is not always reliable, as his motor-car driving often takes precedence over everything else to the serious detriment of both battery and engine.

Voltage.—Many people urge that the most economical voltage to employ, except for large houses, is 25 or 50, and they are led to this view by the question of the number of cells to be employed in the battery. The pressure drop and the size of conductors are, however, equally important points, and bearing in mind that 10-watt 100 volt lamps with a satisfactory life can now be obtained, it would certainly seem that cases where 50 volts is to be preferred are now few in number, and limited to a comparatively small house. Another point is that where current is

* Paper read before the Junior Institution of Engineers on Friday, February 19.

Digitized by Google

MANSION IN PETROGRAD.—M. S LIALEVITCH, Architect.

required for heating or motor driving, 100 volts becomes virtually a necessity, simply on economic grounds.

Complete Plant and its Economy.—The complete plant consists of a paraffin engine, mostly of the vertical high speed type direct, coupled on to a dynamo mounted on an extension to the bed plate, the engine being designed to be started up on petrol, and afterwards switched over on to paraffin after a few minutes' run, when the carburettor will have become heated sufficiently. The economy of plants of this description, though perfectly well known to engineers, does not seem to receive sufficient publicity. For a small set giving only 3½ to 4 kilowatts of output, and such as one would use for a house containing about 140 lights, a consumption as low as 1·6 pints of paraffin per kilowatt hour can readily be had. In a case now before me of this size the cost for fuel will work out at something like 5*s*. per week for 140 light job during the winter months. The dynamo is almost exclusively used for charging a battery of accumulators, from which current is taken *via* the main switch-board to the lighting and other circuits. I think the usefulness of this paper will be best served if, instead of dilating upon details of equipment, I confine myself mainly to some of the more usual mistakes one comes across therein.

Arrangement of Plant House.—(*a*) For some obscure reason, when a new house is to be built, the space to be allotted for the electric plant is usually of the very smallest possible dimensions. Not unusually this important item is left unconsidered until everything else has been settled. The placing of a plant in a very confined space cannot produce the greatest efficiency of working. The man who looks after it amongst his other duties usually considers those other duties more properly his own, and, therefore, his already somewhat meagre affection for the electric plant is not likely to be increased by unnecessary difficulties and inconvenience in working. To refer to one or two instances of this: In one country residence with which I was concerned, having decided upon the size of the engine room, the professional adviser for the general building then proceeded to find out what was the largest size of engine which could be accommodated, with the final result that in the ordinary course of working the charging of the battery had to be prolonged for several hours, owing to the small size of the plant. Further also, the cooling tank had to be placed in a passage running at right angles to the engine room, so I have no doubt this glorious design can better be imagined than described. In another case the engine room was placed underneath the drawing-room, and in order to improve its acoustic properties it was carefully lined out with match-boarding.

Digitized by Google

When requested to visit the installation I could hardly share the surprise which the owner found in the serious noise which resulted when the engine was running.

In a third case the size of the engine room of a new house was originally settled on the assumption that a small gas plant was to be used. The owner, however, discovered this pious intention, and immediately insisted on electric light. Unfortunately, those responsible for the building construction found themselves unable to provide any further space for an electric plant, with the result that the battery room can only be entered from the engine room, and for the most part ventilates into it. The water tank had to be placed in a loft over the engine room, this tank being only accessible by means of an ordinary ladder.

(*b*) Another common mistake in the lay-out consists in the connection between the engine room and battery room by means of the main switch-board. It seems to be rather fashionable amongst many electric contractors and architects to have a hole left in the wall which divides the engine room from the battery room, the main switch-board being recessed into this. Two results may follow. One is that the acid fumes from the battery have free access to all the bare copper and brass connections of the switch-board, and the other is that with a view to meeting this point the back of the switch-board is sometimes boxed in with woodwork so as to form a shallow cupboard, only to receive, later on, various odds and ends and rubbish generally, and thus provide a good opportunity for fire.

However small the plant may be, I have invariably insisted on the switch-board being kept absolutely in the engine room and on its being fixed out from the wall by angle irons, with a clear 18 in. space at the back, thus providing a fireproof job and giving every facility for inspection of connections.

(*c*) Another very usual arrangement much to be deprecated occurs in the fixing up of the battery. Batteries being now much smaller in size than they used to be owing to the much reduced power required by the adoption of metal filament lamps, often the battery is put in a single row of cells down each side of the room, and one finds that for cheapness the stands are only made about 18 in. high, the result being that the cells rarely get properly examined. An even worse practice I have seen followed is that of doing without stands altogether and placing the cells direct upon the floor. It can well be imagined that then the cells are *never* examined, until the time comes when they refuse to provide any output.

Preferably, the cells should be on a stand of a height to allow for convenient and ready inspection, say 2 ft. 6 in. to 3 ft. high.

Main Switch-board to House.—Usually, though not always, the engine room is a building or part of a building quite detached from the house, with the result that mains have to be run from the one to the other. For the sake of appearance, these are usually laid underground. For some reason contractors, when left to their own resources, usually favour V.I.R. conductors drawn into a screwed pipe, these conductors being sometimes lead covered. Care and experience is required in this class of work much more so than seems to be usually allowed, the usual cause of trouble being:—

(1) Pipe line laid without a proper fall or any means of drainage.

(2) The lead sheathing not being properly earthed, even if earthed at all, with consequent risk of pitting, corrosion, and subsequent breakdown.

Interior of the House.—I turn now to a general consideration of the equipment in the house itself.

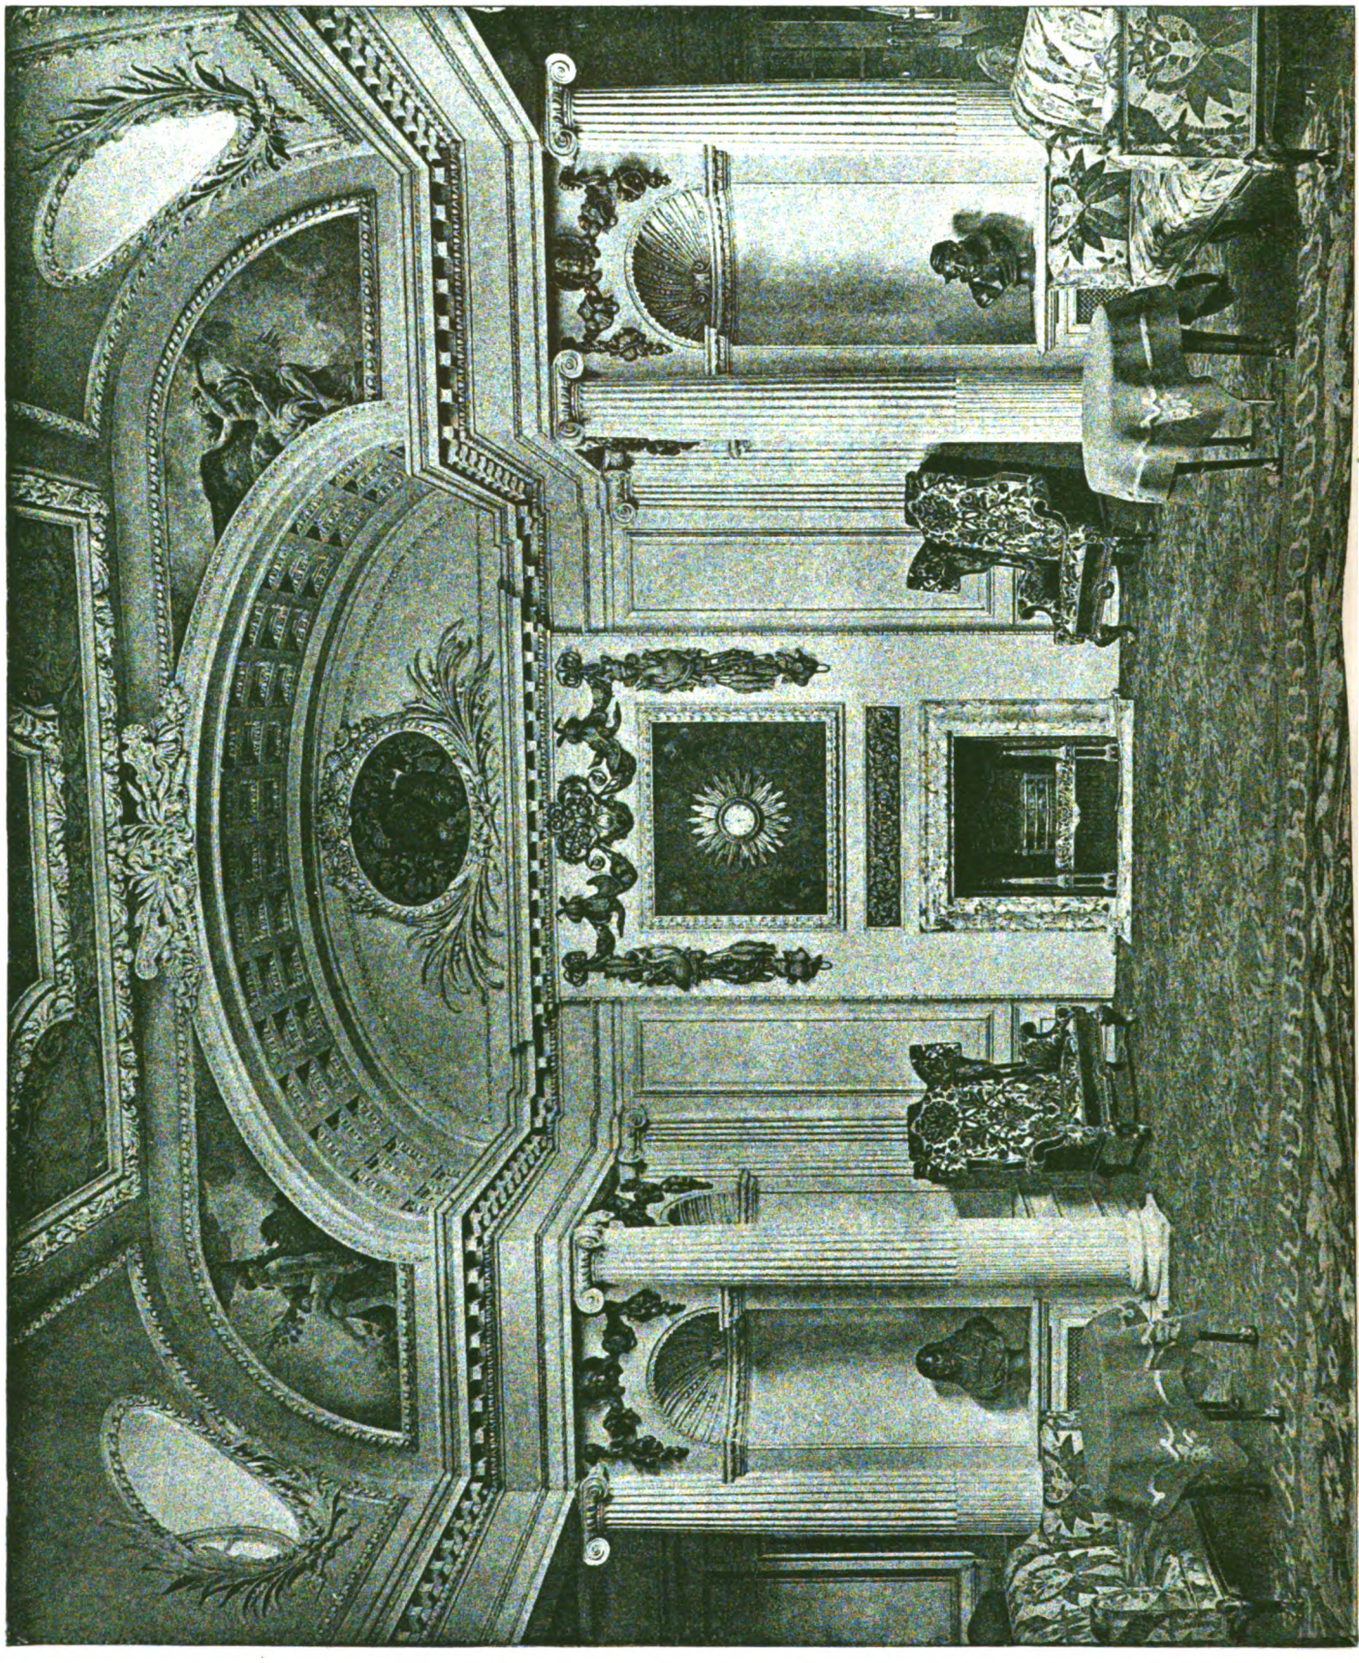
General Run of Mains.—In country houses of no great size, but requiring possibly only fifty to eighty lights, the main conductors which feed distribution boards can readily be run in pipe work chased into the main walls. In houses of larger size it sometimes happens that the architect provides a small trench which runs right round the house, and is intended to contain the electric mains as well as the pipes required for the other services, such as hot and cold water supplies, telephone, bells, vacuum pipes, &c. The idea of this trench, on first thoughts, sounds exceedingly good, and is undoubtedly a convenience; but it does not necessarily follow that it provides the best means of carrying the electric pipe work. Usually it is too limited in size, and often the hot and cold water services are so mixed up with the electric pipe lines that the latter are apt to suffer. If a separate trench were provided for the electric work only this would be quite another matter, and would no doubt be very satisfactory.

Control from Main Switch-board.—The point that often receives insufficient attention is that the mains between the engine room and house should be fused at each end. This is a necessary convenience, both for testing and also for isolation in case of fire.

Distribution Board System.—The number and arrangement of distribution boards must necessarily vary considerably according to the size and general arrangement of the house. There are, however, a few points which should always be borne in mind if the best design and greatest convenience is to be obtained. Generally, there should be at least one distribution board for each floor, and it is, I think, preferable that the lighting fed from any board should be limited to the one floor or the part of the house which it is intended to serve. For the sake of avoiding a little extra trouble, it does happen sometimes that one finds the wireman has circuits belonging to the ground-floor fed from the same way or ways as other circuits which serve a part of the bedroom floor. In large establishments it is often desirable to have two or more boards feeding the ground-floor. It may generally be said that in the absence of an independent specification the tendency is for the distribution board system to be much too limited, and one has noticed, for instance, a small country house carrying about 100 lights fed entirely from one 10-way distribution board. An important point often omitted, but which I always insist upon in my own work, is that of numbering each way of each board and providing a chart or list fixed in or near the distribution board to show exactly the circuit or circuits fed from each way.

Wiring System.—It may safely be stated that the system mostly favoured, particularly for new property, is some class of pipe work, and in this grave errors and omissions are often made. A notable instance is the use of slip-socket tube laid under plaster work, simply of course for the sake of cheapness in the first cost. It is sometimes urged that the use of some form of contact nipple so as to ensure metallic continuity overcomes every objection. This is not so. The tubing still remains slip-socket, having, therefore, an open seam and also other objections. Assuming that welded or other class of absolutely closed tube is used, the point most commonly omitted is that of the proper and efficient earthing of all metal work. In country house installations supplied from their own independent plant it has been urged to me that the universal earthing of the metal work of the job, including switch knobs and cover plates, involves a needless strain or rather stress upon the insulation resistance; but personally I would rather strain or stress the insulation than strain or stress the ladies or gentlemen who occupy the house, particularly as their personal insulation resistance is not likely to be as good as that which I would guarantee for the job.

Conductors.—With regard to the system of conductors, the only point to which I wish to refer in the limited time at my disposal is that of voltage drop. It is as curious as it is unfortunate that many of those engaged in this class of work altogether ignore this question of drop, and would seem to systematically settle all their sizes on the I.E.E. list of sections, quite forgetting that there is another rule (No. 33*a* of the I.E.E.) which specifies the permissible drop, although I do not necessarily urge that this rule should be strictly followed. It is indeed a matter for grave regret that one should find sections so insufficient that when a small proportion of the lights are turned on or off a visible jump occurs to the lamps remaining on, this giving effects resembling alternately a miniature searchlight and a red-hot hair pin.



Tests.—Tests properly carried out are mostly conspicuous by their absence, and it is surprising how few wiremen in charge are capable of taking the insulation test in such a way as to be of any real value. Not only should the work be tested on completion, but also at regular intervals afterwards, either quarterly, half-yearly, or yearly, and a proper record kept of the results. I think the method which was adopted many years ago by the testing department of one of our large supply companies by far the most reliable. The method consisted in going over the entire building and lighting up every lamp in the place; when this was done the tester turned to the origin of supply, drew the main fuses, and connected up the testing set, thus ensuring that the whole of the job was included.

Not only should tests be taken of the insulation resistance, but also of the earthing to see that this is reasonably good. The circuiting from the distribution boards should likewise be tested, as it not infrequently happens that wire-

men in connecting up cross connect one or more of the circuits.

Lamp Switching.—I would like to refer briefly to some of the great conveniences which can be obtained by proper methods of switch control. What I have in mind is what is commonly known as 2-way and intermediate switching, by means of which a lamp or lamps can be turned "on" or "off" from any one of 2, 3, or more positions, regardless of how the switches may have been left at the other positions.

This great convenience is particularly applicable to hall and staircase lighting, though it is naturally used in many other places.

I have here to show you some actual circuits so arranged, and also some spare switches of the types named and others. These switches have been almost entirely developed by one firm (Messrs. A. P. Lundberg & Sons). I think it might fairly be said that to them very much credit is due for the good results obtained, and for the quality and design of their switches.

Another type of switch which is convenient for some positions is a 2-way-and-off switch which enables one to light or extinguish either one or two lamps, but never both at once.

I might here say that I have only just touched upon the fringe of the art of multiple way-lamp switching. It has now become quite a big subject, but unfortunately one to which very little heed is paid by the electric wiring fraternity.

Automatic Time Switches.—For country house lighting the automatic time switch has a use peculiarly its own. It is of great advantage in securing economy in the use of electricity in the servants' quarters, where unfortunately, as is commonly suggested, waste will most freely occur. By means of this switch the use of current can be automatically limited to any pre-arranged time, and the hours of usage may be varied at will either monthly, daily, or as often as may be most convenient. The clock part of the instrument is quite easy for any ordinary person to set, and the clock itself can readily be fixed in a lock-up case. The circuit to be controlled has one of its main wires connected to this automatic switch. I usually prefer to fix with a time switch an ordinary lamp switch which can be used in case of emergency to short circuit the automatic, as this may sometimes be desirable in cases of illness or other emergency.

Illumination and the Value of Measurement.—I would like to refer to the great importance of the scientific treatment of illumination. Although it is easy to adopt scientific methods in a commercial or business establishment, in the case of a residence one is up against the difficulty of reconciling the artistic views of the inhabitants with one's own views of what forms correct illumination. In the best of cases a compromise has to be struck, and in most cases the scientific treatment has to give way entirely to the so-called artistic taste of those who will use the rooms. Certain cardinal points can often be adopted if one is tactful enough to avoid too much specific reference to them when advising the user. For instance:—

(*a*) Exceedingly bright lights in the field of vision must be avoided, or, in other words, the lighting units must be kept out of direct line of vision.

(*b*) Highly polished reflectors giving images of the lamp filament are to be avoided.

(*c*) Lamps should be so placed that the light does not become reflected into the eye, as often happens with desk or table lighting.

(*d*) An absolutely uniform distribution of light over the entire room is not required, but whilst a certain measure of illumination is necessary for what is called the "general" lighting, the objects specially required to be seen must be made the subject of individual or "local" lighting.

(*e*) A room which is, practically speaking, in darkness, with the exception of one particular part only, is to be deprecated. Such points as the foregoing will not only result in efficiency, but will also tend to preserve without injury the most beautiful of human gifts—that is, eyesight.

Due to the splendid work of the Illuminating Engineering Society of London, much has been accomplished in educating the public as to what is and what is not correct illumination. Unfortunately, the human eye, *per se*, cannot be regarded as a suitable illumination measurer. It is much too easily deceived, and in view of this fact the scientific measurement of illumination has been developed. However subject to errors due to the personal element in testing, it is nevertheless true that illumination tests are of immense value, practically as well as scientifically. Without them, the illuminating engineer would be in much the same position as a steam engineer would be if he had no means of taking indicator diagrams on his engine.

For the different positions in the house very different illumination values are required. Generally, it may be said that the illumination must be somewhere between 1 and 2-foot candles, but for local illumination, such as the dining table or the dressing table, more like 4-foot candles are requisite, some persons preferring even 6, and for such a special purpose as the billiard table 12 to 15-foot candles are considered more appropriate.

In view of the very able way in which this subject was referred to by your past president, Mr. Dunn, in October last, I feel that further reference to it is hardly necessary.

I would, however, like to show you the Holophane Lumeter, which is exceedingly useful in taking measurements of illumination and for other photometric work, such as testing the reflecting power of wall paper or other surfaces, or estimating candle power of light sources. The notions which many people have on the subject of artificial lighting are, indeed, curious. Some, for example, consider it absolutely necessary to be able to *see* the actual lamp, ignoring the law that light on the subject and not in the eye is the law of truth. Other people, whilst admitting the influence of colour on the daylighting of a room, will quite ignore it when dealing with electric or other light. The value of a "matt" surface for lighting and for avoiding glare is usually either disputed by the layman or ignored altogether by him. Recently a friend drew my attention to an extensive type of steel reflector, and thoughtfully suggested to me that the interior finish of its surface, being a frosted aluminium, must surely be wrong.

Conclusion.—Many points of interest in the electrical equipment of a country house which I had in mind to deal with I have, owing to the limitations of time, had perforce to leave out. These would have included such matters as the electric heating, bells, house telephones, water pumping, and the several other useful services performed by that handmaiden of convenience—electricity.

ART IN LONDON.

OLD BUILDINGS IN FLANDERS.

MR. MARTEN VAN DER LOO (of Antwerp) deserves well of his country for his notable industry in portraying the quaintnesses of its landscape scenery. The series of colour-etchings on exhibit at the Gallery of Goupil & Co. (of Bedford Street, Strand) includes views of several structures now destroyed as the result of a ruthless invasion of barbarian hordes. The artist has an appreciation of breadth and a virility of touch which but rarely degenerate into coarseness. In some instances, it is true, the hatching and cross-hatching spoil the effect, as in "Vieux quai aux moules, Lierre" and "Anvers et la Rade," but this treatment is fortunately exceptional.

A very pleasant little sketch is "Petite cour à Anvers," and its neighbour, "Béguinage de Bruges—les grandes arbres," is even better; it is poetic and is fully expressive of its snow-clad sombreness. "Vieilles maisons à Gand (Tichelery)" is notable for its "values," and with the buildings effectively silhouetted against the sky; "Effet de neige à Gand" (a work which gained the Diploma of Honour at Florence last year) is a most sympathetic production, and the suspicion of flatness in treatment answers satisfactorily here. "Reflétements—le long de la Nethe à Lierre" combines breadth, good colour, and well-managed water reflections. "Vieille cour à Anvers" is anæmic, while the woman's figure in the foreground is too slight and unreal. We must include a notice of two Malines sketches —"Le pont gothique" and "Le quai vert," the latter, indeed, showing the further side of the Gothic bridge; the former sketch is distinctly crude in treatment, and acts as an unnecessary foil to its neighbour, which is one of the most masterly drawings in the exhibition. A few sketches from King's Lynn are also included—one an oil colour, which displeased us intensely; but as we do not wish to conclude on a discordant note, we will add our appreciation of the views from the "Béguinage de Bruges" (Nos. 5 and 6), the former for its rhythm and the latter for its unusually broad treatment.

ILLUMINATING ENGINEERING SOCIETY.*

FIXTURES FOR PUBLIC LIGHTING.

(Concluded from last week.)

MUCH that has been said applies both to domestic and public lighting. But in the latter case the claims of good lighting from the decorative standpoint are particularly pressing. Buildings that are frequented by the general public deserve illumination in conformity with the architectural scheme. In a private house defects of taste are perpetrated by the individual; but the conditions in public buildings reflect the artistic sense of the nation.

The lighting of such buildings is too frequently neglected. There is a tendency for the illumination to be considered at the last moment, when the building is almost complete, and the money set apart for its adornment almost exhausted. Cases could be mentioned of public buildings where the interior is impressively designed and lavishly decorated, but the fixtures are of the crudest description and have no relation to the general scheme of the building, although the illumination may be considered good. To the architect it should be a matter for concern how the interior designed by him is lighted.

It is therefore essential not only that good and suitable fittings should be designed under the architect's supervision, but that these fixtures should be placed in the right positions and give the correct illumination. Upon this depends the whole success of his efforts as far as night time is concerned. The position of fittings should be decided at an early stage in the design of the building, thus obviating the frequent practice of placing brackets on the centre of good columns, or over mouldings, spoiling the architectural scheme instead of adding to its effect.

There are those who consider that in churches of historic value the atmosphere should be preserved by retaining old fixtures and illuminants. This is an arguable position, but as a matter of fact the introduction of modern illuminants, at first vigorously opposed, almost invariably comes to pass sooner or later. But it is curious to see that in many such cases the new illuminant, when it is introduced, is employed with little technical skill, and without any serious attempt to grapple with the complex problem of using new illuminants and fixtures in old surroundings. There are, perhaps, few problems in lighting that present such varied aspects. Besides considering the architecture one has to bear in mind the practical points involved in the needs of the worshippers. In large mosques and cathedrals, where the service is mainly carried out by the priest or choir, the congregation do not need so much light as in a modern English church where they take an active part in the proceedings.

Even in those cases in which the lighting has been considered with some care, one often finds a curious neglect of period. For example, while the lighting of Westminster Abbey may be good, the modern fixtures are not in keeping with the architecture. They are not Gothic, but have a strong Dutch influence. Those installed in Liverpool Cathedral are perhaps not so efficient as lighting units, but they are certainly in harmony with the architecture of the building.

Before leaving this part of the subject a word or two may be said as to the part played by fixture design in exterior lighting. It is a remarkable fact that, while people will spend considerable care on the artistic side of interior lighting the possibilities of outdoor illumination have scarcely been considered. Lamp-posts are erected bearing no relation to the surrounding architecture. There have been a few attempts to design special lamp-posts. A fine model was worked out some years ago by the Royal Academy, and so far as the author is aware the design has not been duplicated. The original model was presented to the Office of Works and now occupies a somewhat forlorn position on the Horse Guards Parade. Another instance of good design is the bronze standard in The Mall. Lamp-posts are usually purchased by the borough engineer. It would be desirable for the designs to be first submitted to an architect.

There are also possibilities in the treatment of fixtures attached to the frontages of buildings, which should be designed to conform with the architecture. Again, the electric sign need not be the hideous object which architects rightly condemn. A solution would be to design a space for the sign, in the same way as one is left for the facia of a shop. This may present architectural difficulties in some cases, but as a rule they could be overcome by co-operation, at the proper stage, between the architect and the electrical engineer.

THE INFLUENCE OF LIGHT AND COLOUR ON DECORATION.

It has already been pointed out that the fixture is an important part in the scheme of decoration. But besides this function the lighting unit has the effect of illuminating surrounding decorations and enabling them to be appreciated. The nature of these decorations should, therefore, have an influence in determining the scheme of lighting to be adopted. For example, if a hall has a painted ceiling and frieze, it is not a satisfactory plan, from the decorative standpoint, to use fixtures which concentrate nearly all the light downwards, leaving the ceiling and frieze in semi-darkness.

The part played by colour in furniture has been mentioned, but the possibilities of colour have been neglected in modern fixture designs. The absence of colour is sometimes considered a drawback to indirect lighting for domestic use; semi-indirect and direct offer more scope by the simple use of coloured material to screen the light. The old-fashioned tent dining-room light would have been abandoned long ago were it not for the colour effects to be obtained. The selection of colours in the lighting appliance to harmonise with the walls and furniture in a room offers scope for considerable ingenuity and taste.

MODERN DEVELOPMENTS.

Of late years a great deal of attention has been devoted to the design of fixtures with a view to the distribution of light in the most efficient manner, and in many cases entirely neglecting the artistic standpoint.

It must be admitted that several types of fixtures designed on traditional lines, and perhaps based on old models, are not particularly efficient as distributors of light: the metal work leaves little to be desired, but the arrangement of light, shades, and reflectors is often inefficient.

It must be borne in mind that the concentration of the greater part of the light downwards by the direct method, which is rightly insisted upon from a utilitarian standpoint, may not always be desirable from an architectural standpoint; the distribution should vary according to the nature of the decorative surfaces to be illuminated.

The indirect and semi-indirect systems of lighting represent a typically modern development, although they were not unknown in the early history of electric fixture design. The relative merits of these systems hardly fall within the scope of this paper. It is a question how far they can be combined with any of the traditional styles. Indirect fittings of certain periods (Tudor, for example) are sometimes made, and their effect may be pleasing. Yet an indirect fitting in a Tudor manor house, having, perhaps, half-timbered ceilings, however deftly adapted, would seem to be an anachronism.

On the other hand, in lighting halls with very fine painted ceilings the method is effective, provided other supplementary lighting is included if required to relieve any possibly depressing effect from dark surroundings.

The use of indirect and semi-indirect lighting should have a distinct influence on ceiling decoration, and it is conceivable that such methods might give rise to an entirely new method. In buildings used mainly by artificial light (theatres, for example) the design of the ceiling has often been expressly adapted to artificial light. Domes have been constructed acting as reflectors, in some cases ceilings and columns of diffusing glass or alabaster have been built in and lamps mounted behind them, and cornice-lighting has been applied in conjunction with decorative friezes.

CONCLUSION.

In conclusion, to summarise the main points of the paper, it may be suggested:

1. That in dealing with interiors of a distinctive period the appearance of the fixture is just as important as the illuminating efficiency. In such cases it is best for the architect to select the type of fixture; ensuring, by co-operation with the engineer, that it embodies modern practice as regards efficiency.

2. That in industrial lighting, such as printing offices, factories, &c., these are best arranged by the illuminating engineer, who should be consulted by the architect.

3. That where it is desired to preserve the correct atmosphere of an old-period room it is permissible to reproduce the fixtures of the particular period, remodelling them carefully to present ideas, which can be done without incongruity.

4. That with a modern room making no claim as to purity in style any system of lighting and type of fixture is per-

missible as long as adapted to the practical requirements of the room.

5. That in outdoor lighting the decorative possibilities of illumination have not yet been properly appreciated.

6. That it is sometimes advisable to consider the method of illumination before designing the room, as various systems of lighting are best adapted to enhance certain schemes.

7. That the above considerations point to a much-needed co-operation between the architect, the engineer, and fixture designer, with a view to raising the artistic as well as the practical aspects of illumination to a higher plane.

Discussion.

Mr. John Darch followed with a contribution which dealt more particularly with design in lighting fixtures and the question whether true art did not demand that twentieth century light should have twentieth century fittings. The beautiful designs of former days were admirably adapted, he said, to the necessities of their time, but to use them with gas or electricity in modern buildings was a caricature. Art should be living and progressive, adapting itself to changing circumstances. High power lights cry for an altogether new class of fixtures, or none at all. In such a design the golden rule should be "fitness for its purpose and fitness for its place." The necessary features of construction should themselves form the lines of beauty. The designer must bear in mind the purposes of the illumination, the intensity required at the working points, the nature of the distribution, the consideration of shadows, the care for people's eyes, &c. The whole history of art testifies to the fact that the best work is that in which charm is put into an article without the need of superfluous ornament. Suitability is more pleasing than ornamentation and practical success than either. Churches, to the fixture designer, are perhaps the most difficult subject, because the fixtures take precedence and govern the illumination instead of the illumination governing the fixtures. The usual result is disastrous failure, for there is more anxiety to get a striking design than to provide for the needs of the people. When art ceases to be consistent it ceases to be true. There is a tendency with certain so-called artistic electricians to misapply objects. For example, a Roman boat or teapot-shaped hand oil lamp has been slung up as a pendant and an electric lamp bulb stuck in the spout-end. Finally, Mr. Darch pointed out that a serious impediment to progress exists in the great fixtures industry itself. Thousands of workmen are daily engaged in the monotonous production of stock patterns over which the controlling force is not art but dividends. As was lately remarked, "Look at any fixture you please and judge for yourself how much is mere excrescence hanging on in the name of art, but having its true motive in the pocket-book."

Mr. A. P. Trotter spoke of the importance of guiding and educating public opinion so as to spread that demand for beautiful things which William Morris had awakened at a time when art was at its very lowest ebb. Many people considered that for private reading nothing was better than a shaded lamp, whereas others held that shaded lamps were entirely wrong. Again, the shopkeepers taught one to furnish in one period, but a good many people were content to mix periods so long as each was good.

Mr. E. P. Warren, F.R.I.B.A., pointed out that Mr. Thorpe had implied in his paper that architecture was in every period self-conscious, and that that fact would influence the lighting fittings. This certainly could not have been the case in the earlier styles. For then such contrivances were evolved from sheer practical needs just as much as were the products of the metal worker, the glazier, the carpenter, or the carver. All these were working in accordance with their traditions, but they produced things which please because they were so intensely suited to their purpose. To-day we were dealing with an entirely different illuminant, and it seemed to him that if our work was to give anything more than passing interest the fixture must be endowed with a form thoroughly appropriate to its use. At present, unfortunately, the tendency was to hark back perpetually and to use dead men's ideas and so escape the trouble of thinking for oneself. Architects were the chief sinners, for they were always cribbing and copying. The young architect certainly needed the steadying influence of good old work; but once he has found his feet he should think for himself. The new illuminant offered a splendid chance for originality. What an uncomfortable type of fitting was the standard table lamp with its trailing wire! Were there no better means of charging lamps than that adopted for the existing battery lamps? The Illuminating Engineering Society might well turn their attention to bringing out a substitute for the miserable standard lamp. The designer, having first come to a conclusion as to the best way of applying the light for the particular fitting he is designing, should think of the kind of building or room in which it is to be placed. But he should not think about style or ornament. He (Mr. Warren) entirely protested against the idea that electrical fittings should be in any obedience to the style of the building. The charm of our old churches is their succession of styles. There was no reason why such fittings should not have charm by contrast as well as charm by harmony. The parish churches of France, for example, nearly all contain eighteenth century crystal chandeliers. So long as the workmanship put in is thoroughly beautiful it did not matter to what style it belonged. He hoped before long to see practical beautiful fittings of the second decade of the twentieth century, and ones which they would not be ashamed to introduce into any building whatsoever. It was useless to dogmatise about the lighting of a room because there was so much difference of opinion.

Mr. P. J. Waldram described the wonderful success of the lighting arrangements at St. Jude's, Golder's Green (although in theory they should be open to objection), which were marked by absolute utility and nothing else.

Mr. C. H. Burt defended the manufacturer for keeping to familiar designs by blaming the conservatism of architects, who insist upon having them of definite styles. Again, the manufacturer of decorative fittings is handicapped by the requirements of the electrical engineers to which they must conform. The new voltages were far too high to get the best decorative results.

Mr. Percy L. Marks thought it was a great mistake for any architect to profess that he is an expert on every point in connection with a building. It would be much better if the profession were to recognise that their main work was the planning of a building, and that the architect should call in the co-operation of experts in different branches, such as lighting, heating, and so on. Possibly this may seem a counsel of perfection, but it would lead to much better results. If this suggestion applied to certain special sciences it applied to lighting more than any. Mr. Thorpe was, in his opinion, quite wrong in imagining that architects design their lighting fixtures in accordance with the style of their building. Any attempt at such co-ordination would be a great mistake and would produce a sense more of a museum than of a comfortable building.

Mr. A. E. Penn supported the previous speaker in the view that if co-operation were brought into existence better results would be attained. The difficulty was at the present moment to get professional gentlemen to realise they were in an age of specialisation. Illuminating engineering had become a science now, and if co-operation could be achieved the lighting profession were in for a better time.

HALF-WATT LAMPS AND FITTINGS.

Comparatively few people appreciate the very radical change in the methods of lighting that the introduction of the new half-watt lamps will of necessity bring about. As a lighting authority recently stated, the half-watt lamp compels the use of some form of indirect lighting, as the intrinsic brilliancy of the concentrated filament is too great to be used in any of the usual open direct methods of lighting.

The very large gain in economy will cause the half-watt lamps to be widely used, and with their introduction will come a complete change from the generally crude ineffective methods of employing lamps in ordinary reflectors. Not only will the efficiency of lighting be improved, but the attractiveness of illumination will be enhanced through the proper use of these half-watt lamps in suitable indirect fittings. As an example of the beautiful and attractive results that can be secured, readers of this Journal are referred to the lighting installation of Messrs. Selfridge & Co. in their new annexe for groceries and provisions in Oxford Street. These new premises are lighted by means of these half-watt lamps in B.T.H. "Eye-Rest" indirect lighting fittings. The results are excellent. The whole store is beautifully and efficiently lighted, and must be seen to be appreciated.

Now that half-watt lamps are available in considerable quantities for prompt deliveries, it is desirable to remind purchasers of the importance of using these new lamps in suitable and correctly designed fittings. It is absolutely necessary that this be done if disagreeable and distressing glare is to be avoided and the agreeable and attractive lighting effects instanced above are to be secured.

THE
Architect and Contract Reporter.
FRIDAY, MARCH 5, 1915.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addresed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than* 2 P.M. *on Thursdays.*

COMPETITIONS OPEN.

BRADFORD.—March 31.—The Corporation invite competitive designs for the re-planning of streets in the central area of the City of Bradford. Mr. Reginald Blomfield, R.A., will act as assessor. Particulars may be obtained on application to the undersigned, accompanied by a deposit of £1 1*s.*, which will be returned on receipt of a *bonâ-fide* design. Mr. Frederick Stevens, Town Clerk, Town Hall, Bradford.

GALEMIRE (WHITEHAVEN).—The Galemire Joint Hospital Committee invite competitive designs for a small hospital proposed to be erected in their district. Full particulars may be obtained from Mr. E. B. Croasdell, clerk to the Committee, Union Hall, Whitehaven.

STEPNEY.—The Borough Council invite architects to submit designs in competition for the proposed municipal buildings, and have appointed Mr. Henry T. Hare, F.R.I.B.A., to act as their assessor. Conditions of competition may be obtained after March 1 on receipt of £1 1*s.* deposit, which will be refunded on submission of a bona-fide design or the return of the conditions within fourteen days of their receipt. Mr. G. W. Clarke, Town Clerk, Municipal Offices, 15 Great Alie Street, Whitechapel, E.

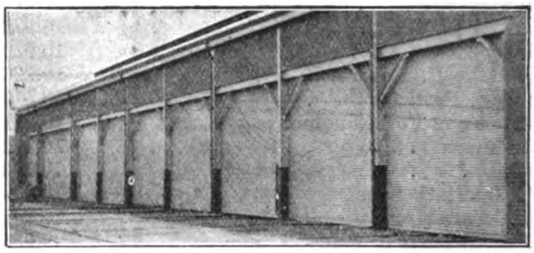
THE Welsh National Museum Council sitting on Monday at Cardiff consented to a proposal made by the assessors that the four blocks of sculpture on the south front of the new building should represent the pre-historic period, the classical period, the mediæval period, and the modern period respectively. This modification of the original arrangement was agreed to.

SIR WILLIAM MATHER ON THE DUTY OF DIRECTORS AND SHAREHOLDERS.

SIR WILLIAM MATHER, Chairman, presided at the annual meeting of Mather & Platt, Ltd., on Friday, February 26, at the company's works, Manchester.

Comparing the results of the business during 1914 he said that in his opinion they were very satisfactory. A dividend of 10 per cent. on the ordinary shares, plus a bonus of 2½ per cent., free of income tax, had been declared. In arriving at their statement of profit during the past year the directors had thought it prudent to first secure the business against unforeseen contingencies that might arise in consequence of the unprecedented situation created by the sudden change from long years of universal peace to that of war on a colossal scale. They, therefore, decided not to add to the already large reserve fund, but to carry forward a larger sum than ever before—£66,838. The directors did not anticipate a revival of active business with the countries engaged in war to any great extent during the war. The firm had contracts booked with such countries, but would be unable to execute them until after the war. Meantime their works were fairly well employed and they had undertaken certain contracts which the Government placed with well-equipped firms.

It was a popular delusion that Government contracts were exceedingly profitable. Such contracts had to be completed under tremendous pressure, and it was the duty of contractors on patriotic grounds to make every effort, regardless of cost, to supply the Government with what they needed. And by strain and stress and all possible overtime the work had to be done to meet the demands. Another consideration which would affect the profits of most industrial concerns during the war was the indisputable fact that the cost of food had risen and might still rise to a price that would sensibly affect the workpeople of the country by seriously diminishing the purchasing value of wages. This was a grave question which employers and all concerned with industrial undertakings should meet sympathetically and patriotically with the desire to lighten the burdens of their workpeople. The working classes, being most numerous, furnished most of the fighting men. Their families would feel most acutely the pinch of excessively dear food. It was not right to ask sacrifices of them for the common weal greater than those which all other classes made according to their means. Charitable relief of the working classes was least effective and most demoralising. The greatest help that could be given to workpeople was to provide them with work at a living wage, adjusted to the cost of living frugally and carefully with self-denial and self-restraint on their part during the war. It seemed to him that company directors and shareholders should frankly face the facts affecting the people's food supply. Large dividends during war times should not be a primary consideration with them. They should first try to provide as much work as possible at wages that would enable workmen to reasonably nourish themselves and their families, having due regard to the avoidance of waste and self-indulgence. Business profits earned under those principles might be small, but shareholders ought to bear the sacrifice of part of their dividends as their contribution towards the relief of the universal suffering which the war had caused. Strenuous efforts should be made to keep the industries of the country alive during the war. Violent trade disputes on account of wages amounted to high treason at such a time. The war would pass all the sooner if those concerned in the industries of the country held well together, and after the war a long, lasting peace, with great prosperity, would repay them for the sacrifices they had now to make in order to secure the victory.



THE Shipping, Engineering, and Machinery Exhibition which was to have been held at Olympia from July 23 to August 14 has been postponed until 1916 or 1917. Mr. Charles H. Luke, the secretary of the Exhibition, is to be congratulated on the fact that he has succeeded in settling what had become a very difficult matter—the holding of an exhibition which might possibly have been a failure, or its postponement. The amount for space let is being paid into a trust fund for the purpose of carrying out the proposed Exhibition some time next year or the year following. Mr. Luke, the exhibitors, and the Olympia Company are to be congratulated on the satisfactory manner in which a very difficult problem has been solved, and the result will secure a prosperous undertaking soon after the termination of the war.

ECONOMY IN REINFORCED CONCRETE.

AT a recent meeting of the Concrete Institute a paper was read by Mr. T. A. Watson, Assoc.M.Inst.C.E., entitled "Economy of and in Reinforced Concrete."

While great savings can be made on retaining walls, it is generally not economical to employ reinforced concrete for the external walls of buildings, as brick walls up to a thickness of 14 inches are cheaper, but that when walls have to be thicker than this reinforced concrete comes in. As under the proposed London County Council Regulations nearly all external walls need not exceed 14 inches in a framed building, it is probable that reinforced concrete walls for this purpose will soon cease to be used from the point of view of economy.

With regard to the economy of reinforced concrete-framed buildings outside the London area the economy is very considerable; inside the London area the London County Council, by their regulations, propose to reduce it as much as possible. There are, however, opportunities to effect savings over a steel-framed building even in London. It is often possible, allowing for variations in design, to make a saving of 10 to 20 per cent. by constructing in reinforced concrete instead of in steel. Yet at the present day there are many buildings being built in London as steel-framed structures which could more economically be built in reinforced concrete, and that therefore there must still be many people in London who have yet to be convinced of the desirability of the latter form of construction. Other cases may, of course, not show quite so favourably, but on the other hand there are cases which may show more favourably.

There is another factor which enters into the question of building operations of all kinds, and that is time. Many people are of opinion that the quickest form of construction is steel construction. If drawings have been prepared a long time in advance so that the steel framework has been fabricated beforehand and is ready for delivery the moment it is required it may be that the steel frame is the quicker, but this is not always so; and starting from the point, *i.e.*, the time when working drawings of both reinforced concrete frame and steel frame are ready, generally some time after the foundations of the building have been started, it is possible in ordinary times to obtain steel bars in fourteen days from that date, but it generally takes six weeks to obtain built-up stanchions so that at the beginning reinforced concrete gets a four-weeks' start.

Again, in steel-framed buildings many architects use coke-breeze concrete or broken brick concrete between the R.S.J. fillers. Neither of these are water-tight; reinforced concrete 4: 2: 1 is practically so. In a building constructed some years ago seven storeys high the plaster work was started on the ceilings of floors below the fourth before the seventh floor was finished, and as each of the remaining floors took about a fortnight to do, another month or six weeks was gained on the steel-framed building as asphalt on the roof would have been necessary to prevent rain coming through the breeze or broken brick floors and spoiling the plaster.

While there are still many to be converted to a belief in reinforced concrete there are some enthusiastic admirers of the material who desire to use it in every possible way, and on every possible occasion. One of the ways in which it is used in which the author said he was not convinced of its economy was in pitched roofs which need formwork both sides of the concrete, and asphalt or some other waterproof covering to keep the rain out. These roofs have generally very thin slabs, say 3 in. thick at most, and then the concrete costs a fabulous amount to get it in place, especially if the building has a series of saw-tooth roofs running from side to side or end to end with no flat passage-way to take concrete to the centre. These 3-in. slabs are generally supported by very light reinforced concrete trusses with sometimes diagonal members, and the roofs altogether constitute a nightmare to the contractor, who in a thoughtless moment undertook to construct one. Roofs like these should last for ever, so there may be economy in the long run, though they ought to cost more in the first instance than steel trusses, &c.

It seems hardly necessary to mention that in the construction of bridges, say up to 300 ft. span at least, reinforced concrete is nearly always the most suitable material. There are, of course, exceptions, but the mere question of the cost of maintenance of a steel bridge seems enough to condemn it.

The question of maintenance should also be enough to decide an architect or engineer to choose reinforced concrete for the construction of, say, small water-towers, coal-bunkers, gasometer-tanks, or any similar structure heretofore built in steel, and exposed to atmospheric conditions, even if reinforced concrete is not cheaper in the first instance.

With regard to timber structures the same applies; and in addition the relatively greater resistance to destruction by fire makes the advantages of reinforced concrete so apparent that one wonders why timber is employed in the construction of wharves at all.

But turning to the other side—viz., economy in reinforced concrete, the author said he would like to emphasise a point which in these strenuous days of competition seems to be overlooked, or rather ignored, and that is the enormous amount of waste which occurs through one of the methods adopted by architects to obtain cheap prices for the carrying out of work. An architect prepares the general design of a building and sends sunprints of same to four, five, or even six different firms of specialist designers, who in turn prepare each their reinforced concrete scheme and send out to five or six or even more contractors for prices, involving a total of some thirty or forty persons, all of whom spend money and time in tendering &c. Much valuable time is also wasted which might otherwise be spent in the construction of the building whilst the various prices and schemes are being compared and adjudicated on. This puts an initial charge on reinforced concrete which might be avoided if the architect or engineer would only choose his system, or employ an experienced consulting engineer to design the reinforced concrete work, and then send out for prices in the usual way.

Another point which makes for economy in reinforced concrete, but has more to do with design, is the number of steel bars that have to be handled. It will be readily understood that it is just as easy to handle a 1⅜-inch-diameter bar 25 feet long as it is to handle one that is only 1 inch diameter, as the weight is immaterial.

Again, in this connection he might point out that the 1⅜-inch diameter bars occupy less space in the width of a beam than the 1-inch diameter bars, and the labour cost on concrete may be reduced by 30 to 50 per cent. by the employment of the larger diameter bar.

Again, with fewer bars there are fewer ends, and in many cases stirrups or shear members to fix, and the smiths' work is correspondingly reduced.

The reading of the paper was succeeded by a discussion, in which the following members took part: Professor Henry Adams, M.Inst.C.E. (President), Mr. Percy J. Waldram, F.S.I., Mr. Percy H. Simco, Mr. Ewart S. Andrews, B.Sc., Mr. Morgan E. Yeatman, M.A., M.Inst.C.E., M.Am.Soc.C.E., Mr. Archibald Scott, A.R.I.B.A., Mr. Habib Basta, Assoc.M.Inst.C.E., Mr. W. A. Green, M.A., B.Sc.Eng., Assoc.M.Inst.C.E., Mr. T. C. Dawson, Mr. W. J. H. Leverton, Licentiate R.I.B.A., Mr. E. F. Etchells, Assoc.M.Inst.C.E., F.Phys.Soc., A.M.I.Mech.E., Mr. J. F. Warden, and Mr. T. A. Watson, Assoc.M.Inst.C.E.

A LOCAL Government Board inquiry was held at Shipley last week relative to the Urban Council's application to borrow £73,000 for the erection of 298 workmen's dwellings on the "garden city" principle. It was stated that there was a great dearth of houses of this class, and although since the outbreak of the war the rate of interest for money had increased, the Council felt that in the interest of the town they ought to proceed with the scheme.

MR. MUIRHEAD BONE has made a drypoint entitled "Piccadilly Circus, 1915," which will be published by Messrs. P. & D. Colnaghi & Obach, for the benefit of the Belgian Relief Fund. There will be 100 impressions at ten guineas each. As Mr. Bone is presenting the plates and Messrs. Colnaghi & Obach the whole of the profits without deductions, the Fund will ultimately benefit to the extent of one thousand guineas.

THE plans for Berwick's new station having been passed by the directors of the North British Railway Company, work will be proceeded with shortly. It is understood that the cost will be between £30,000 and £40,000. A feature of the scheme is an island platform between the up line and the down line. This will be 800 feet in length, and it will be reached from the booking hall by means of a bridge; and there will also be an hydraulic luggage lift. This scheme includes up-to-date waiting-rooms and offices. The first portion to be executed will be the new bridge carrying the great North Road over the railway.

2,604. Jan. 31, 1914.—A. F. Berry, 27 Woodville Road, Ealing. Electrical heating apparatus suitable for cooking, water-heating, and like purposes; and 2,605, Jan. 31, 1914. Means of apparatus for heating water and other liquids.

2,607. Jan. 31, 1914.—J. M. Downer, 172 King Street West, Toronto. Sand papering and grinding machine.

2,661. Feb. 2, 1914.—G. M. Park, Roden, Gorse Road, Blackburn. Apparatus for cooling clinker in the manufacture of cement and other like cooling apparatus.

2,681. Feb. 2, 1914.—W. M. Dodds and G. A. Stoner, 26-28 Emerald Street, Bedford Row, W.C. Hot-water circulating and supply systems.

2,695. Feb. 2, 1914.—W. H. Owen, 19 Home Park Road, Wimbledon. Means for heating steam generators.

2,718. Feb. 2, 1914.—F. H. Johansson, Herrhagen 153, Karlstad, Sweden. Process of manufacturing posts and boards of waste or rough-edged wood.

3,048. Feb. 5, 1914.—H. G. Nicholson-Lailey, Kamari, Bythesea Road, Trowbridge. Pipes and method of joining same.

8,046. March 30, 1914.—Gottfried Bodmer, Kusnacht, Switzerland. Self-closing valves.

8,403. April 3, 1914.—J. S. Porter, 30 Welbeck Road, Bolton, Lancs. Roof glazing.

3,625. Feb. 12, 1914.—O. G. Trigg, 62 Adeline Street, Newport, Mon. A new cement.

4,840. Feb. 25, 1914.—E. A. Hansen, Nordre Fasanvej 32, Copenhagen. Pumps for raising and delivering water and other liquids.

5,659. March 5, 1914.—P. G. Donald, of Rownson, Drew & Clydesdale, Ltd., 225 Upper Thames Street, E.C. Rain-water pipes.

12,907. May 26, 1914.—F. W. Smith, 5 Thornbury Avenue, Southampton. Fire-extinguishing alarm and indicating apparatus for use on board ships and in large buildings.

14,334. June 15, 1914.—The Falkirk Iron Company, Ltd., and Robert Kidston, all of Falkirk. Kitchen ranges.

18,648. Aug. 13, 1914.—H. C. Hahn, Gayford, Sibley, Minnesota, U.S.A. Fire escapes.

18,847. Aug. 20, 1914.—Planet Foundry Company, Ltd., and James Learmouth, Planet Foundry, Guide Bridge, near Manchester. Adjustable grate fronts for domestic fireplaces and the like.

23,261. July 23, 1914.—W. B. Young, 1 Weir Street, Falkirk. Ranges or grates.

Any of the above specifications may be obtained from J. D. Roots & Co.

THE Swansea Corporation, at a meeting last week respecting the proposed erection of 500 houses on the Town Hill estate, decided "that the Housing and Town Planning Committee be instructed to obtain a tender for the erection of 100 houses on Town Hill, such tender to include an option to the Corporation to ask for the erection of 400 further houses in lots of 100, and that in the event of the committee being unable to obtain such a tender they be instructed to accept a tender for the erection of 500 houses." During the debate, which lasted several hours and was in private, it transpired that the average price, according to tenders received, and including the three classes of houses proposed to be erected, was about £243 per house. Since the outbreak of the war the price has increased by 20 per cent. Between the highest tender received just before the war and the lowest the difference was £80,000 for the 500 houses, and it is now feared that the war increase will mean, if the houses are to be made self-supporting, increased rentals of as much as 2*s.* 6*d.* a week. To meet this difficulty the Government is to be approached with a view to a subsidy being granted.

VARIETIES.

THE Hemsworth Rural Council have accepted the tender of Messrs. Swift Bros., South Elmsall (£2,360), for improving the sewage works.

MESSRS. LAVINGTON, LTD., have received the contract for carrying out additions to the Waddon Waterworks for the Croydon Borough Council. The tender amounted to £2,793.

THE Carlisle Education Committee have adopted a scheme for the erection of an open-air school at Blackhall at an estimated cost of £3,480. The plans were prepared by Mr. H. C. Marks, M.I.C.E., the city engineer.

THE Nottingham Corporation determined last week to persevere with the project for making Nottingham a port, at an estimated cost of £150,000, by widening and deepening the Trent, and to advance £10,000 towards the construction of the Newark nether lock.

A MEETING of the Management Committees of the Unions affiliated to the London Building Industries Federation is to be held to-day (Friday) to discuss the question of approaching the London Master Builders' Association for an immediate advance in wages and improved working conditions.

A LECTURE on the history and architecture of St. Bartholomew-the-Great, West Smithfield, will be given on Saturday, March 20, and repeated on March 27 at 2.30 P.M. No charge will be made for visiting the crypt and cloister, but there will be a collection for the Restoration Fund, which is in debt. The thirteenth century window recently discovered will be then opened out to view.

LA SOCIETE DES ARCHITECTES DIPLOMES PAR LE GOUVERNEMENT, in virtue of a decision of their general Assembly Law, conferred upon the President of the Architectural Association the right to be a corresponding member during his term of office. Mr. Gerald C. Horsley, F.R.I.B.A., Past-President Architectural Association, has by the same decision been elected a corresponding member *a titre définitif*.

THE *Gazzetta Ufficiale* (Rome) of February 12 publishes the text of regulations (in Italian) governing the construction of emergency dwellings as a result of the recent earthquake. These regulations may be consulted by United Kingdom firms interested at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C.

A SUPPLEMENTARY Estimate under the heading of Civil Services is concerned with the requirements of the Trustees of the National Gallery. The sum in question is £6,600, which is required to pay export duty to the Italian Government on the pictures of the Layard Collection now in Venice. It was not anticipated that duty would be exacted, but it has been found that the payment of duty is necessary under Italian law.

AT the meeting of the Institution of Civil Engineers on February 23 the members received an intimation that H.M. the King of the Belgians and also Admiral Lord Fisher of Kilverstone, First Sea Lord of the Admiralty, had consented to accept election as honorary members of the Institution. The election was effected forthwith by acclamation, and the addition of these illustrious names to the small group of distinguished men who form the Institution's roll of honorary members is a source of much satisfaction to the members.

TRADE NOTES.

MR. HERBERT H. GRUNDY, the head of the well-known firm of John Grundy, Ltd., heating and ventilating engineers, of City Road, N., and Tyldesley, near Manchester, has been elected President of the Institution of Heating and Ventilating Engineers. The name of the late John Grundy will always be remembered in connection with scientific heating by hot air. Mr. Herbert Grundy is continuing the family tradition, his name being associated with a special system of electric heating.

WE are informed that the walls of the Police Station at Worcester, which were frequently damp, have been cured by a rendering of Pudloed cement. The Office of Works are users of "Pudlo," and among the latest works for its inclusion is the Dundee new Post Office; the cement mortar and all renderings are to be waterproofed with "Pudlo." A brickwork basement at the Queen's Hotel, Eastbourne, has been converted into a tank. The brickwork was given a Pudloed cement lining, and now holds several thousand gallons of water. The architect reports that not a sign of damp has shown through.

FORTHCOMING EVENTS.

Monday, March 15.

Royal Institute of British Architects : Paper entitled "English Monuments," by Mr. James Williams, at 8 P.M.

Royal Society of Arts : Cantor Lecture I., entitled "House Building," by Mr. M. H. Baillie Scott, at 8 P.M.

Wednesday, March 17.

Manchester Society of Architects : Paper entitled "Some Aspects of Romanesque Architecture," by Professor A. C. Dickie, M.A., A.R.I.B.A., at 6.30 P.M.

Carpenters' Hall : Paper entitled "Rheims—a Typical French Cathedral," by Mr. Banister F. Fletcher, F.R.I.B.A., at 7.45 P.M.

Thursday, March 18.

Edinburgh Architectural Association : Paper entitled "Mote, Castle, and Peel—an Evolution Illustrated," by Mr. George Neilson, LL.D., at 8 P.M.

Concrete Institute : Paper entitled "The London Building Acts, with some suggested Amendments," by Mr. Osborn C. Hills, F.R.I.B.A., District Surveyor for the Strand, at 7.45 P.M.

London University : Paper entitled "Town Planning in Antwerp, Past and Future," by M. Alfred Portielje (Hon. Sec., Royal Society of Architects, Antwerp), at 5.30 P.M.

SUB-AQUEOUS FOUNDATIONS.

THE most ancient form of under-water foundations was probably that of dumping in loose stones until the surface of the water was reached, and the masonry could then be commenced without the necessity for any method of excluding the water. Though this method of "rip-rap" or *pierre perdue* has remained in use even to the present time, its obvious disadvantages have led to the more prevalent use of other methods making for greater certainty and economy of material.

In much of the older civilisation in tropical and sub-tropical countries, where the streams are dry beds for many months in the year, suitable foundations were easily made without trouble from water. Even where shallow water prevailed on a rock bottom, the piers of bridges were, withough difficulty, well founded in the shallowest places, the bridge often winding across the stream in serpentine form, as in the case of the ancient bridge over the River Karun, at Shuster, in Persia. The necessity of finding shallow water in which to build piers has often influenced the course of a bridge and its localisation on the site of a primeval ford.

Ancient bridges of large spans were often the solution of the difficulty of founding piers in mid-stream, as in the instance of that over the River Adda, at Trezzo, built by order of the Duke of Milan some time prior to the year 1390. The span of this bridge was 251 feet, covered by a single arch of granite in two courses.

Developments in forming foundations for piers in water-courses led to the use of open caissons; the use of piles with a capping of coarse concrete about the tops; the use of piles as an enclosure or encaissement; the use of coffer dams, and the more modern method of pneumatic caissons. Another expedient in ancient times which was an avoidance rather than a solution of the difficulties of sub-aqueous foundations in bridge-building was diversion of the river channel either to a new course under a bridge erected in advance or to a temporary channel.

By the Romans open caissons and piles were both used. The former consisted of rough baskets formed of branches of trees, weighted with stones to sink them, and after sinking were filled with loose stones to near low-water level, where the masonry could be commenced. In this way some restraint was enforced on the haphazard assortment of material known as rip-rap. The use of open caissons has continued till modern times, with the substitution of boxes for baskets. These were used at Blackfriars Bridge and Westminster Bridge.

The Roman use of piles is explained by Vitruvius, who says, "Foundations should be carried down to solid bottom, if such can be found, and they should be built thereon of such thickness as may be necessary for the proper support of that part of the wall standing above the natural level of the ground. They should be of the soundest workmanship and materials, of greater thickness than the walls above. . . . The intervals between the foundations brought up under the columns should be either rammed down hard or arched, so as to prevent the foundation piers from swerving. If solid ground cannot be come to, and the ground be loose or marshy, the place must be excavated, cleared, and either alder, olive, or oak piles, previously charred, must be driven with a machine as close to each other as possible and the intervals between the piles filled with ashes. The heaviest foundations may be laid on such a base."

This method of encaissement as used by the Romans was accompanied also by that of using piles at distances apart depending on the nature of the bottom, but with their heads not necessarily to the same level, and encasing them in coarse concrete. They also, no doubt, adopted, too, the Venetian method of driving piles, which were whole and unwrought tree-trunks, as close together as they could be got over the whole surface to be covered by the foundations. Certain it is that included amongst the equipment of their highly efficient skill in construction the Romans included a thorough knowledge of piling and its possibilities.

The deficiency of the methods known generally used by the Romans lay in the lack of opportunity they presented of seeing or making a careful examination of the bottom on which the foundation was to be placed. The removal of this deficiency was effected by the use of coffer dams and diving-bells.

Coffer dams may be defined as water-tight enclosures, from which the water is pumped to expose the bottom and permit the laying of foundations. As usually constructed, the enclosure is formed of guide and sheet piling in double ranks, tied together by cross beams and filled in between with clay puddle. Whilst in shallow and quiet water the formation of a fairly water-tight coffer dam is a matter of no great difficulty, the operation becomes formidable with great depth and rapid current, more particularly in rivers that are frozen in winter.

The most remarkable example of coffer dams ever constructed is probably those for the piers of the Buda Pesth suspension bridge over the Danube, of which Mr. W. Tierney Clark was the engineer. The water was assumed at 10 feet deep at low tide, 20 feet at high tide, with 12 feet of sand and gravel to be removed to expose

Digitized by Google

the clay on which the piers were to rest. Four rows of piles were driven around the area, the rows 6 feet apart, and filled in between with a puddle of clay mixed with sand and gravel. But even this solid mass did not prevent leaks, and further piling had to be driven to stop them. Great cut-waters in the dams were constructed to resist the enormous pressure of the winter ice.

The difficulty of forming water-tight walls to coffer dams in severe cases is not the only drawback to their use. It frequently happens that water comes in under the walls of the coffer dams and from springs in the bottom, even when the precaution has been taken to remove as much as possible of the soft stuff by dredging. Thus in modern work the coffer dam has lost much of the favour with which it was regarded in the earlier half of the nineteenth century.

A simple form of coffer dam, which may be generally used when the conditions are such as to admit of any coffer dam being advisable, is the crib. This consists of a couple of bottomless wooden boxes, one inside the other, the space between being afterwards filled in with puddle, or even of one box. The boxes can be formed afloat of boards or heavy planks laid one on top of another and spiked together. When built they are tied across at intervals and sunk.

Diving-bells date back to a considerable period, and may be regarded as the forerunners of the modern pneumatic caisson. The earliest account we have of the use of compressed air is given by John Taisner of Hainhault, born in 1509, who went to Toledo with the Emperor Charles V., where he saw two Greeks let themselves down under water in an "inverted cauldron" with a light, and return to the surface without getting wet; but the diving-bell used by Smeaton at the Hexham bridge in 1778 is really the first use of compressed air on bridge foundations of which we have an authentic account.

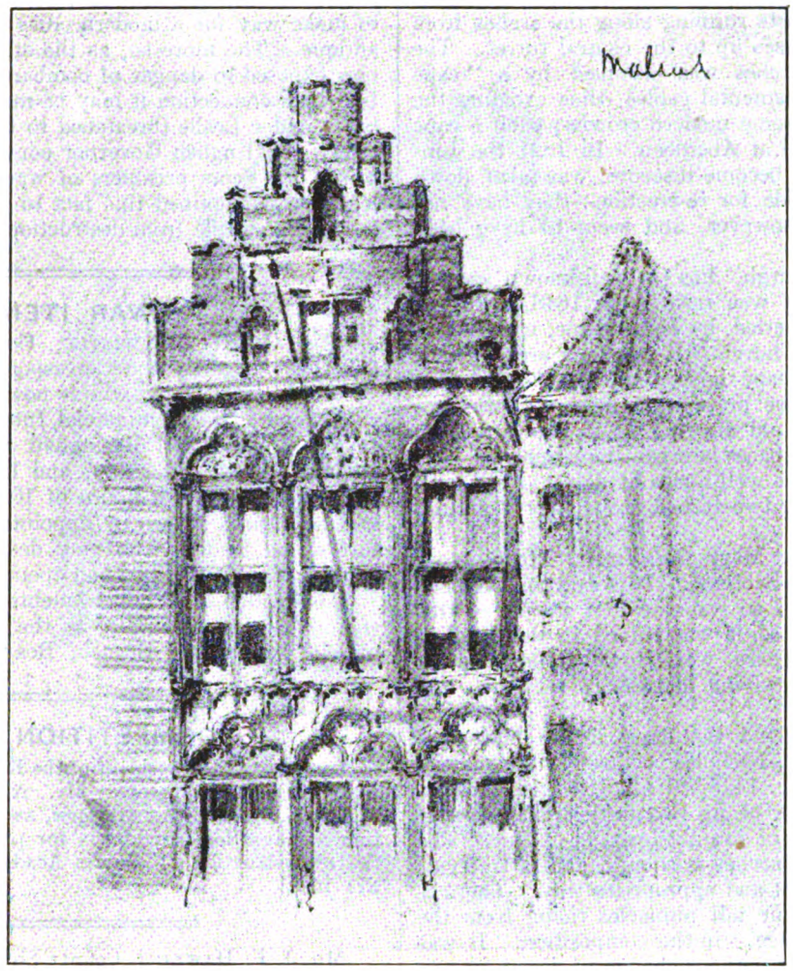
The detailed arrangements of many examples, especially of those occurring in the United States, of the methods we have indicated will be found excellently explained with many diagrams in a book* by Charles Evan Fowler, recently issued by John Wiley & Sons in New York, and Chapman & Hall in London.

NOTES AND COMMENTS.

WAR is undoubtedly disastrous to artists of all kinds, probably more than to any other class of the community, and almost the only recompense they receive is to be found in the execution of war memorials. We note that the crop of these has already commenced in the inception of a scheme for the erection of a granite Memorial Cross, designed by Sir George Frampton, which *The Weekly Dispatch* is presenting to the bravest village in the United Kingdom—the village which has sent the highest percentage of its population to fight for our country.

In the meantime it is cheering to observe that the example of *The Weekly Dispatch* in presenting a national memorial is being followed by schemes for the erection of county memorials on the same lines. Mr. F. C. Arkwright, Deputy-Lieutenant for Derbyshire, has already offered to give a permanent memorial to the Derbyshire village which sends the highest percentage of men to the Colours; and now the Lincoln Chamber of Commerce has decided to award a cross to the county village which shows the best recruiting returns to the end of March.

Mr. Halsey Ricardo has practically illustrated in his work the possibility of enduing modern buildings with colour, and is, therefore, qualified to urge on his brother architects the desirability of introducing more extensively the use of colour as an essential component of modern architecture. In a lecture to the members of the Birmingham Architectural Association he introduced his theme by asking what would the average man of taste say if coming upon Trafalgar Square from Whitehall he found that during the night, and without any warning, Nelson's Column had been placed on a grass plot, that all the bronze plaques and the lions had been gilt, that the shaft of the column had been painted navy blue, the bronze capital wholly gilded, and Nelson himself and his clothes painted to resemble as closely as possible what the hero looked like just before the battle of Trafalgar? His first impression would be that an outrage had been committed. The ordinary man in the street, not knowing what to think, would condemn the horrid sacrilege as the simplest and safest way to view it. But to the wholly unsophisticated man there might be something said for this treatment—a treatment that would have been adopted in Babylon, in Egypt, in Greece, in Rome, in Byzantium, and in the Middle Ages. However, he preferred to consider what might be their opportunities for providing special colour decoration for the interior of buildings, and especially their public ones. How were they to find the *corpora vilia* on which to cut their wisdom teeth? He suggested that the class-rooms of the elementary schools were a suitable field for an attempt at forming a school of decorative painters, but it was not proposed that the decorations should be permanent. The attempt should start with a simple scheme. He thought the heraldic treatment of colour was the right treatment to begin on, and the use of heraldic emblems helped to give a picturesque reinforcement to the study of history. Heraldry was a kind of history in shorthand. Various groups of men and women should be formed to undertake this elementary decorative work, and as the standard rose under such practice the more able decorators might be employed to decorate walls on an ascending scale of importance, such as workhouses, infirmaries, hospitals, waiting-rooms of stations. And when the quality of permanence had at last been earned and acquired, they might adorn the walls of public libraries, town halls, museums, and churches.



In his course of lectures on town-planning at Birmingham University, Mr. Barry Parker has treated the subject of individuality in towns, a characteristic that is evident in many well-preserved ancient cities, but sadly lacking in modern instances. In explanation of this decadence Mr. Parker has advanced a theory which, we think, is only partly true.

Quoting Aristotle's dictum that "a city is a place where men live a common life for a noble end," he said that a village had been a real community in the past, led by the squire and the parson, with the doctor, the smith, the shopkeeper, and the farmer all taking their allotted place and forming part of an organised community, of which the village was a visible expression, having unity and homogeneity. But when all this gave place to the ideal of "every man for himself," which characterised the nineteenth century, and to the one relationship of employer to employed, there being nothing but meanness to express, the result was mean. The hope for the future was that democratic ideals would build up a state of society based on relationships with something noble in them, capable of being nobly expressed.

Whilst there may be a possibility, in the event of Germany's defeat, of a return of some of the artistic masterpieces which have been looted for their money value, it will, we fear, be otherwise with the small bronze statues in the Petit Sablon Square in Brussels, which a correspondent of the *Morning Post* says have been

* *A Practical Treatise on Sub-Aqueous Foundations*, including the coffer-dam process for piers and dredges and dredging, with numerous practical examples from actual work. By Charles Evan Fowler, Consulting Civil Engineer, Member of American Society of Engineers, &c. &c. Third edition, revised and enlarged. (New York: John Wiley & Sons, Inc. London: Chapman & Hall, Ltd. 31s. 6d. net.)

AT MALINES.—From a Sketch by Mr. HUON A. MATEAR, F.R.I.B.A.

removed and sent to Germany. They will no doubt be returned in the form of shells or other deadly missiles.

The bronze statues in question were forty-eight in number. They surrounded the monument of Counts Egmont and Horn, and represented the artistic and industrial guilds of the sixteenth century.

Bell towers separated from the churches to which they are supposed to be an adjunct have been the cause of much speculation to archæologists and of legend to the populace, but in the case of that at Launceston, Mr. C. L. Hart Smith, F.S.A., puts forward an explanation that may be also elsewhere the correct one. In his brochure, "The Borough of Dunhevet, Cornwall," he shows that the tower was really a campanile, or bell tower, and used for observation purposes; that it stood in its own ground, and was not a part of the church dedicated to St. Mary Magdalene; that it was a borough building, owned by the Corporation, which supplied a clock and the bells and paid the ringers; and that the Corporation occupied the ground floor with its machines for weighing wool, yarn, and other things. The tower was also used as a store, and complaint was once made that the occupier kept hens and barrels of hogswash in it! Upon the land between the tower and the church the Corporation built a Council Chamber, which in 1880 was acquired by the church authorities and converted into a vestry.

Mr. Hart Smith marshals his facts and cites his authorities in a manner that compels conviction, and few possess the hardihood to question the one or dispute the other. In a preface he has much that is interesting to say with regard to the ancient name of Launceston, and insists that the history of the borough can never be properly studied unless it is ever borne in mind that its Corporation was and still is lord of the manor of Dunhevet.

Proposals for the removal of Glasgow's Tolbooth Crown have excited interest in the city on the subject of crown steeples, and in the *Glasgow Herald* Mr. H. L. Honeyman contributes an interesting article, in which he says:—

Beginning our survey at the North, and taking the crowns in geographical order, first comes that at King's College Chapel, Aberdeen, erected for Bishop Elphinstone between 1500 and 1505. This steeple at one time possessed 10 bells (including the heaviest in Scotland), and the crown had to be repaired on several occasions. In 1633 it was blown down: "Bot the crown was quicklie afterwards restored in a better forme," and bears the inscription "George Thomson, Architect, 1634." Its rather lumpy outline may be due to Mr. Thomson's improvements. It has two arches—*i.e.* two arches cross its base from corner to corner, like the diagonal ribs of a groined vault, the intersection being marked by a pinnacle or turret—in this case a stone crown. A crown of four arches has two additional ribs crossing from centre to centre of its sides.

A crown, with similar details to St. Giles', Edinburgh, was designed for the tower of Dundee Church. Its arch springers still exist, and some years ago its completion was proposed but unfortunately not undertaken.

The steeple of Culross Abbey so closely resembles that of Linlithgow Church that a similar termination was probably intended. If so, it is not known to have been erected. The tower of St. Michael's Church, Linlithgow, contains a bell dated 1490, but is generally stated to date from c. 1530. It bore a two-arched crown of

Digitized by Google

very elegant composition, with an unusual feature in the shape of tracery parapets running along the arches from the large angle buttresses up to the central turret. The space beneath the arches was occupied by a "cape house" with four ornamental gables, thus avoiding the empty appearance of some modern crowns; such a cape house formerly existed at Aberdeen. In 1821 the Linlithgow crown, having become insecure, was taken down and its pieces laid aside for re-erection—they have not yet been re-erected, however, and seem to have been allowed to disappear.

St. Giles', Edinburgh, has a well-known crown. First built c. 1500, it was restored in 1648, with the quaint details of that period, by John Milne, architect of the Edinburgh Tron Church. It has four arches, and, although it had no cape house, the openings in its buttresses show that the present platform roof was not intended; indeed one old drawing of it shows a high leaded roof filling the spaces between the stone ribs. At Pinkie House there is a well-house of date c. 1613 with a small but interesting two-arched crown worth noting, though not a steeple.

The church of St. Mary the Virgin, Haddington, had the finest crown in Scotland. It is said to have been erected c. 1450, and if so was the first steeple of this kind. If ever completed it was ruined in the English invasion of 1548. There were four arches, as at St. Giles', and the surviving details are very rich and beautiful.

Of crowns in England the finest is the large and graceful example at St. Nicholas' Church in Newcastle-upon-Tyne, completed c. 1475. Unlike Scottish crowns, this one has the backs of its two lofty arches formed as ogee curves, instead of straight lines, in outline. The steeplet carried by the arches is square, and is traceried and pinnacled in a light and appropriate way. There is no cape house, but four tall pinnacles rising from the sides of the tower replace it in the composition. It was rebuilt last century, but without change of design.

The steeple of St. Mary-le-Bow was destroyed in the Great Fire of London, and little is known of its appearance except that it had a crown of the Aberdeen type, and was probably of large dimensions.

St. Dunstan's in the East, London, has an original and well-composed crown, built in 1698 from designs by Wren. Its two unmoulded arches, with curved extrados, support a graceful obelisk on a composition of intakes similar to those on the hidden flying buttresses of St. Paul's.

Quite out of the crown steeple districts stands the Glasgow Tolbooth tower. Accounts of its history were published when its destruction was proposed a couple of years ago, and its appearance is, or should be, familiar to every citizen. Its details place it as a work of the same school as Heriot's Hospital, Edinburgh, and the Old College, Glasgow. That is, it belongs to the period which separated the earliest Scots Renaissance from the mature work of the Scottish "Queen Anne" style. It shows strong Teutonic influence, probably Dutch—the Town Council consulted a Dutchman when altering Blackfriars Church in the seventeenth century—but it is undeniably "racy of the soil" of Scotland.

In the last half of last century a revival of crown building took place, following the erection of the Wallace Monument at Causewayhead, with its splendidly monumental crown, designed by J. T. Rochhead. Curiously enough, most modern Scots crowns are in the west of Scotland, not the east. Of these perhaps the most notable are the Coats Memorial at Paisley and the Stevenson Memorial at Belmont Bridge, North Kelvinside.

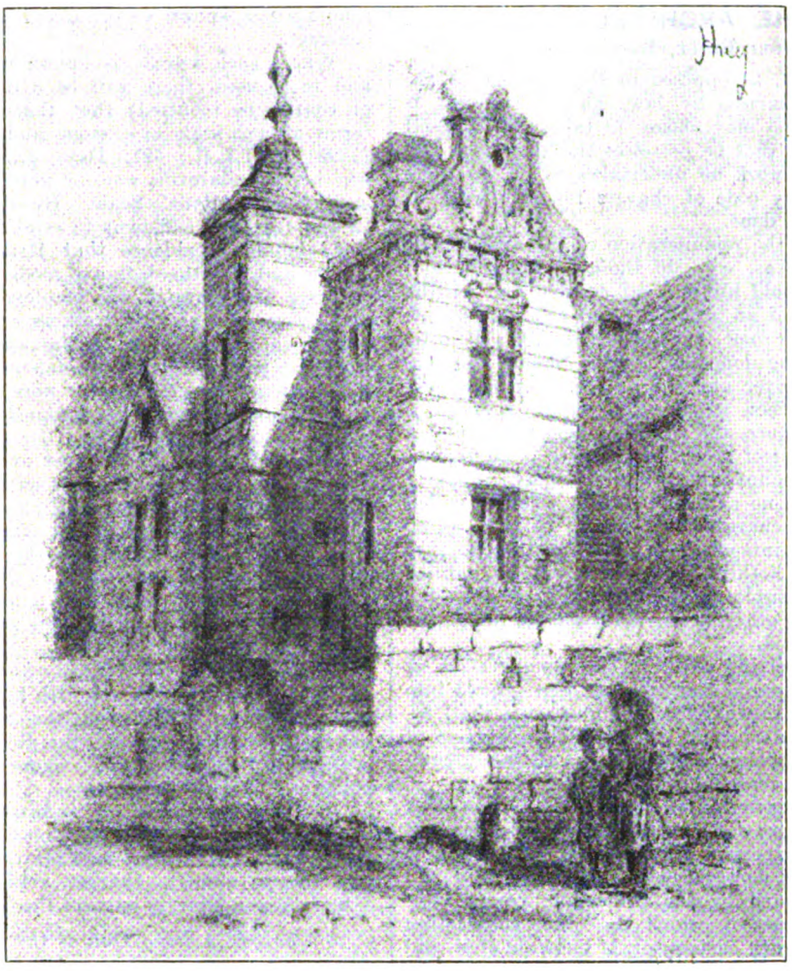
The old Tolbooth crown is remarkable in several ways —*e.g.* it is not near the east coast, it is, with the exception of St. Dunstan's, the only old crown steeple which has never been rebuilt, it contains an interesting carillon, and it is one of our last relics of the seventeenth century. For a considerable period it served, with the aid of a platform built on its south side, all the purposes of a Mercat Cross, and it would be a pity were it removed to make way for a modern cross or replaced by a sham antique. The more so, as the other ancient crowns are now exposed to danger of bombardment from air or sea. In which connection it may be mentioned that when the Scots under Leslie threatened to bombard the Newcastle crown the English Governor converted its belfry into a prison for Scots prisoners of war. He then, or so the legend runs, notified this fact to the besiegers, and thus saved the steeple from destruction!

WAR ITEMS.

Mr. C. A. Birtwistle, Commercial Intelligence Officer in Nigeria, the Correspondent of the Board of Trade for that Colony, who is now on a visit to England, will attend at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C., on Wednesday, Thursday, and Friday, March 17, 18, and 19, between the hours of 10 a.m. and 5 p.m., and will be pleased to see by appointment British manufacturers and traders who may desire to consult him regarding trade conditions and openings in Nigeria.

Application for appointments with Mr. Birtwistle should be made promptly to the Director of the Commercial Intelligence Branch, Board of Trade.

COMPETITION NEWS.



Dundee.—The President of the Royal Institute of British Architects has appointed Mr. A. N. Paterson, M.A., A.R.S.A., F.R.I.B.A., Glasgow, as assessor in the competition amongst local architects for plans in connection with the reconstruction of Harris Academy. The fee is to be £71 10*s*.

Mr. J. F. Hawkins, County Surveyor of Berkshire, had the honour of being received by the King at Buckingham Palace on March 2, to submit the design of the new Albert Bridge between Old Windsor and Datchet. The design was prepared by the County Surveyors of Berks and Bucks, to be constructed on the system of the Trussed Concrete Steel Company, Ltd. Their Majesties expressed their approval. Mr. Hawkins also submitted a design of the proposed bridge between Goring and Streatley.

A recent examination of the Rowley Regis parish registers, dating back to 1539, which suffered considerably from a fire at the parish church in 1913, reveals the fact that some of them have shrunk to exactly half their former size, and are barely legible owing to damage by fire and water. One portion rotted away and had to be destroyed. Two parts were saved because they were not in the chest at the time of the fire. Fortunately the whole series had been transcribed and have since been printed for the Staffordshire Registers' Society.

We regret to announce the death of Mr. Henry Dawson, F.R.I.B.A., of the firm of Henry Dawson & Son, architects, 122 Cannon Street, E.C. He was in his eighty-eighth year, and had retired some years ago. Mr. Dawson commenced practice in 1852 at 122 Cannon Street, afterwards removing to Finsbury Circus, where he remained for upwards of sixty years. A few years ago the firm returned to its original quarters. For twenty-four years he was architect and surveyor to the Salters' Company, and on his retirement from that position in 1905 he was succeeded by his son, Mr. W. Cecil Dawson, who still carries on the practice. Mr. H. Dawson designed for the Salters' Company warehouses in Friday Street and those in Bread Street in the occupation of the Great Northern Railway Company. He also made some additions to Salters' Hall. He acted as architect and surveyor to the Wax Chandlers' and Stationers' Companies, and other Guilds and public bodies, including the Moravian Trust Estates in London. Among his chief works were the London Orphan Asylum, Watford; the Hand-in-Hand Insurance Society's offices, New Bridge Street; alterations to Emanuel School, Wandsworth Common; and numerous warehouses and offices in the City. He was architect for the extension of the Pitt Press, Cambridge, and for the Almshouses at Maidenhead, erected by the late Mr. George Herring.

ILLUSTRATIONS.

HOUSE, REGENT'S PARK, N.W.

THE illustration shows the entrance front of the above house, which was built three years ago for Sir Boverton Redwood, Bart. The walls are faced with Lawrence's bricks of many shades of grey and purple, and the roofs are of Collyweston stone. Internally there is a good deal of oak half-timbering and old panelling, whilst several rooms have modelled plaster ceilings. Messrs. W. H. Maxey & Son, of Sleaford, were the general contractors, and Mr. John C. Pocock acted as clerk of works and also executed the modelling and carving. The architect was Mr. M. H. Baillie Scott.

CAMBERLEY HEATH GOLF CLUB-HOUSE.

THIS building was erected in connection with the already well-known new eighteen-hole golf course for the Camberley Heath Golf Club at Camberley. It is beautifully situated on very high ground.

In execution the plan has been varied to a certain extent. Externally the walls are of brick, covered with white rough cast; the roofs are tiled with hand-made, sand-faced "antique" tiles, made by the general contractors at the Aldershot Brick and Tile Works. The chimney pots are black. The casements, &c., are divided up by stout wood bars into small squares.

Internally the walls are finished with plaster and Hall's washable distemper in light tints, the paintwork being kept a very dark brown throughout. The dining-room has an open timber roof with wood trusses, the timber being stained dark, and the space between the rafters plastered to match the walls.

The principal room is the lounge, and it is so planned that full advantage is taken of the extensive views of the surrounding country. The fire-places have been built up in thin Dutch bricks and roofing tiles to the special designs of the architect.

It has been possible to work the basement at the ground level on the north side owing to the slope of the hill, and in this ample accommodation is provided for the professional, workshops, showrooms, and caddies' rooms. This arrangement works well, and does away with the usual unsightly temporary sheds so often seen erected for these purposes at golf clubs.

The building is heated throughout by hot-water.

The general contractors were Messrs. George Kemp & Co., of Aldershot, who carried out the work under Mr. H. Reginald Poulter, the architect.

The drawing of this building herewith reproduced was exhibited last year at the Royal Academy.

ST. AUGUSTINE'S CHURCH, ADDLESTONE.

THE drawing of this church, which we reproduce this week, was exhibited at the Royal Academy last year.

It was intended that the building should be faced in Bargate stone, with Ham Hill dressings and tracery, but it has now been decided to use brickwork throughout, with the windows built up in specially made moulded bricks for the tracery, &c. The roof will be covered with dark, hand-made, sand-faced tiling.

Internally the walls are to be plastered. The sanctuary and aisles are to have close-boarded barrel ceilings, the nave having an open timber roof, with each pair of rafters trussed. At present it is proposed to carry out only a portion of the entire scheme, comprising the chancel, vestries, organ chamber, and three bays of the nave, filling in the temporary west end with timber, covered with elm weather-boarding. The tower will finish just above the ridge of the nave roof. Messrs. Mardon & Mills, of Farnham, are to carry out the work, and Mr. H. Reginald Poulter is the architect.

STAIRCASE, CHRIST CHURCH COLLEGE, OXFORD.

THIS drawing was made by Mr. Chas. S. Carter during his tour as holder of "The Architect" Travelling Studentship for 1914.

THE LAW AS TO THE REMUNERATION OF THE ARCHITECT.*

By A. Montefiore Brice, Barrister-at-Law.

Just as the profession, as opposed to the practice of the architect, is not regularised by law, and its pursuit is open to any person who may choose to take upon himself the risk of holding out that he possesses the knowledge and skill required for the work he undertakes to do, so there is no legal or statutory code of charges for such work as he has undertaken and done.

The profession and the remuneration of the architect do not depend on statute as, e.g., do those of the solicitor; but any person may hold himself out as able and willing to undertake the work of an architect, and any such person may sue for and recover some, but not necessarily a definite, remuneration for having done that work. Should the contract between the employer and the architect, or some subsequent contract, whether written or verbal, specify in exact terms or by reference, the charges which the employer shall pay and the architect accept, then there is an express contract as to the amount the architect may properly charge; but if there be no express contract, whether verbal or written, as to such charges, then it will be held, as no professional man can intend or can be required to give his skill and care for nothing, that there was an implied contract between the employer and the architect that the one should give and the other receive a reasonable remuneration for services rendered.

This is the legal doctrine affecting the remuneration of the architect, unless a specific contract has been entered into between the parties as to what that remuneration shall be. In the absence of such a contract, then the remuneration of the architect must be such an amount as in all the circumstances seems fair and reasonable.

Architects have endeavoured on many occasions to show that the scale of charges recognised by the profession has in course of time and experience amounted to a "custom"; but no scale of charges, however widely known within and however generally adopted by the profession, can, if unreasonable, govern a case in which the other contracting party did not know of such custom, or, if knowing of it, did not expressly or impliedly consent to it. Formerly, the practice of the profession in this respect, received perhaps greater attention than it has obtained in more recent years, and in 1869, Lord Romilly, in Attorney General *v.* Drapers' Company (L.R., 9 Eq. 69), said that "the charges of brokers on the transfer of stocks and shares are paid by a commission, and if a similar practice prevails with respect to surveyors' charges I shall not disturb it. It prevents disputes as to amount, and the charges fixed by the scale do not seem too high."

The modern and still prevailing view was put clearly enough by Lord Coleridge, L.C.J., in Burr *v.* Ridout (1893, *Times*, February 22); and followed by the same judge in Farthing *v.* Tomkins (1893), 9 T.L.R., 566; and in Gwyther *v.* Gaze (*Times*, February 8, 1875), by Quain J., who held that an alleged customary charge of 2½ per cent. on the lowest tender, when no tender had been accepted, was unreasonable, and left it to the jury to say what sum would be reasonable. While it is within the province of the jury to assess the amount which would be reasonable, it is the function of the judge to decide as to whether an alleged custom is reasonable. The Courts have always taken upon themselves to consider whether a custom is or is not within the bounds of reason, and if the custom is unreasonable, the Courts have said that they will not recognise it as binding on people who do not know it and have not consented to act upon it. Perry *v.* Barnett (1885), 15 Q.B.D., 388. per Brett, M.R., at p. 393. And in Debenham *v.* King's College, Cambridge (1884), 1 T.L.R., 170, it was held by Wills, J., that there is no custom between surveyors and their clients by which the former can base their acount on Ryde's Scale of Fees for Surveyors' Charges; and a surveyor, in the absence of a special agreement, is only entitled to charge a fair and reasonable sum for his services.

If, however, there is contained in the contract (as there should always be) a clause dealing expressly with the remuneration of the architect, no difficulty need arise; neither should there be any difficulty when the amount and scale of the charges is agreed by reference to be in conformity with the scale of the Royal Institute of British Architects or with Ryde's Scale or some other method of computation known to or accepted by the parties to the contract.

Where such a scale is known by the employer to exist and to be used, there will be a presumption (which may, of course, be rebutted) that the employment is upon the terms of such scale or custom, and in Buckland *v.* Pawson (1890), 6 T.L.R., 421, Day, J., said the question was whether the plaintiffs were or were not employed upon what was known as Ryde's Scale. He did not think the evidence in the case was sufficient to establish a custom, but there was abundant evidence that Ryde's Scale was generally known and was the ordinary mode of remuneration of surveyors. The plaintiff was employed by defendant, who, it was sworn, had employed others and had himself been employed on Ryde's Scale. There was overwhelming evidence that the persons whom the defendants entrusted with the duty of employing a surveyor were well acquainted with the custom, and it must be assumed that the plaintiff was employed on Ryde's Scale.

Similarly a custom, however unreasonable, is binding on the parties if the contract is entered into by them upon the terms of such custom. Thus in Blackburn *v.* Mason (1893), 9 T.L.R., 286 C.A., it was held by the Court, per Lord Esher, M.R., that a party could only be bound by an unreasonable custom when at the time of dealing on the market the custom was made known to him and he had agreed to be bound by it; and see Cooke *v.* Eshelby (12 App. Cas. 271).

There should be no difficulty as to the scale of remuneration if the architect agrees with his employer that his payment shall be made upon the basis of the schedule of charges as drawn up by the Royal Institute of British Architects, supplemented, where necessary, by Ryde's Scale.

The charges which an architect in the course of and arising out of his profession may be called upon to make are many and various, and may now be considered under two heads, namely, charges arising out of the Building Contract and charges outside the Building Contract.

Charges Arising Out of the Building Contract.

According to the Schedule of the Royal Institute of British Architects and the practice of the profession, the usual remuneration of the architect is a 5 per cent. commission upon the total cost of the works executed under his directions, and this commission is payment for the necessary preliminary conferences and sketches, approximate estimate when required, the necessary general and detailed drawings and specifications, one set of tracings, duplicate specification, general superintendence of works, and examining and passing the accounts, *exclusive* of measuring and making out extras and omissions.

The commission does not include payment for services rendered in connection with negotiations relating to the site or premises, or in supplying drawings to ground or other landlords, or in surveying the site or premises and taking levels, making surveys and plans of buildings to be altered, making arrangements in respect of party walls and rights of light, or for drawings for and correspondence with local and other authorities, or for services consequent on the failure of builders to carry out the works, or for services in connection with litigation or arbitration, or in the measurement and valuation of extras and omissions.

But the practice of the profession shows that such commission of 5 per cent. is inadequate in the case of works of less cost than £1,000, or of highly decorated buildings, or of alterations and additions, and in such cases the architect's fee is one which is reasonable in the special circumstances of each case.

If the architect sends in an estimate or submits drawings for approval and they are not accepted or approved or used, no claim for remuneration in respect of the estimate or drawings, in the absence of an agreement to the contrary, will arise. Thus in Moffat *v.* Laurie (1855), 15 C.B., 583, the architect made surveys and plans for the employer without charge upon the understanding that he should be appointed the architect upon the land being sold for building purposes, but the employer died and his executors put it out of their power to sell the land for building purposes, and it was held that he could recover nothing, inasmuch as the event on the happening of which alone the plaintiff was to be entitled to remuneration for his services, namely, the disposal of the land for building purposes, had not happened.

In Moffat *v.* Dickson (1853), 13 C.B., 543, the architect

* A Paper read before the Society of Architects on Thursday, March 11.

Digitized by Google

agreed to examine the site proposed for a lunatic asylum, and to prepare preliminary probationary drawings for the approval of the visitors' committee, and subsequently to prepare the whole of the working drawings, estimates, and specifications for the asylum, and to accept £437 10*s.* for those services. The probationary drawings were not approved, and upon that ground it was held that the architect could not recover.

With regard to competition drawings everything turns on the precise terms of the invitation to compete, and in the absence of any undertaking to pay, the drawings must be regarded in the light of estimates for which no charge can be made. Thus in Ward *v.* Lowndes (1859), 28 L.J., Q.B., 265, the architect sent in drawings for a covered market house upon the invitation of the advertisement of the Commissioners, who also offered a premium of £20 for the best design in the event of the maker of such design not being selected as the architect. The plaintiff sued on the ground that his was the best design, but he failed in his action.

But if the plans or estimates or preliminary work is used at all, even if the architect is not engaged to superintend the work, he can recover on a *quantum meruit*. Thus in Lindley *v.* Wilson (1880), 8 Ct. of Sess. Cas. 4th Ser. (Rettie) 289, an architect prepared detailed plans, and though the buildings were not proceeded with, the employer used the plans to his advantage in dealing with a purchaser of the ground. The employer denied liability on the ground that the plans had been furnished upon the footing of there being a competition; but it was held that assuming the fact to be as stated by the defence, it still lay in the employer to prove that the employment was gratuitous, and this he had failed to do. The Court held that the architect was entitled to reasonable remuneration, and Lord Shand added (p. 293): "If I had been of opinion that the case was one of a competition of plans between the two architects, and the defendant had afterwards thought fit not to build at all, I should have had great difficulty in holding that he would have been entitled to say to the competitors, 'You shall be paid nothing for the plans and labour you have bestowed on me.' My impression is that each of them would have been entitled to receive a *quantum meruit*." But the defence of competition was negatived by the Court.

Charges Outside the Building Contract.

The architect may be properly called upon to render a variety of services in no way necessarily connected with the usual building contract under which he plans, designs, and supervises the erection or alteration of a building. He may, for instance, be called upon to survey ground suitable for building, or survey buildings, or measure up completed work, or value houses, lands or work, or draft bills of quantities, and act as an arbitrator or as a witness in Court or at an arbitration.

In exercising any of the foregoing functions he is, in the absence of an express or implied agreement for a fixed or ascertainable sum, only entitled to charge what is reasonable. He may, if he choose, charge upon a scale known to and approved by his profession; but, if it be unreasonable, he cannot impose it upon a client who is ignorant of it, or who, upon the making of the contract, could not rightly be supposed to contemplate such a method of computing payment.

See Debenham *v.* King's College, Cambridge (supra). Brocklebank *v.* L. & Y. Railway (1887), 3 T.L.R. Burr *v.* Ridout (supra). Gwyther *v.* Gaze (supra). Perry *v.* Barnett (supra).

But if the employer could reasonably be supposed to know of the scale and of the custom of charging in accordance with it, so that an implied agreement might be inferred, then the architect could sustain an action for payment based upon such a scale (see Buckland *v.* Pawson (1890), 6 T.L.R., 421).

In examining and settling accounts between a builder and a building owner, the architect can recover a reasonable fee for his time and trouble, but the Court will not (except perhaps when the amount of the account is small) permit a charge based upon a percentage of the total amount of the account (Upsdell *v.* Stewart (1794), 2 Peake, N.P., 255).

Nor, in qualifying for giving evidence or for actually giving evidence, can an architect base his fees upon the value of the subject matter in dispute. Coleridge, L.C.J., in Drew *v.* Josolyne (1888), 4 T.L.R., 717, declared that he had never sanctioned and never would sanction the supposed rule that surveyors should be paid for their evidence by a percentage on the sum in dispute rather than by a computation of the work they had done. In that case the surveyor employed as an expert witness had charged £136 for qualifying, and this amount had been reached by calculating a percentage on the work measured. The Master had struck out £106, and allowed the witness £30 for qualifying himself, and £3 3*s.* a day for attendance during the arbitration, and, on appeal, the Master's decision was upheld.

In measuring up deviations, &c., and in the absence of an agreement to the contrary, the architect is entitled by the custom of his profession to charge a sum over and above his commissoin of 5 per cent. (if such payment by commission is agreed) for doing such work.

In practice the amount is added to the builder's account, or, rather, to the certificate given by the architect to the builder, and this has the effect of putting the architect in the unsatisfactory position of inspecting his own work and certifying for it. But though the charge is added to the builder's account and presented by him to the employer for payment, yet this practice does not entitle the architect to sue the builder for the amount in the event of the employer refusing or neglecting to pay the sum in question. For although as a method of practice the payment has been included in the builder's demand, yet in essence the charge is one for which the employer is responsible, for the work of measuring up deviations and extras by the architect or the surveyor is a work which is obviously for the protection and benefit of the employer and serves as a check upon the builder. It is, therefore, useless for the architect to sue the builder, except for money had and received for the use of the architect. Beattie *v.* Gilroy (1882) 10 Ct. of Sess. Cas. 4th Ser. 226.

The charges of the architect are paid variously, but generally according to agreement and by periodical instalments.

It is a legal principle that if a contract is entered into to carry out an entire work for a complete sum, then the right to that payment does not arise until the whole work is itself completed. If an architect enters into such a contract as this, he runs a serious risk of getting nothing at all. For if he is unable by illness or other cause to finish the work he has undertaken to do, he is by that contract entitled to nothing.

If there is no such contract, then the architect may recover payment as the work progresses, for unless a contrary agreement can be shown, a man is entitled to be paid as soon as he has done any work agreed to be paid for, just as, in the absence of an agreement to the contrary, a vendor is in law entitled to receive the cash of his purchaser in simultaneous exchange for his goods.

Loose language in agreements has on many occasions deprived the servant of his hire. Thus, where a person working for a committee agreed to be paid by the committee on the terms of its resolution that "any service to be rendered by W. shall be taken into consideration, and such remuneration be made as shall be deemed right," it was held, when he brought an action for reasonable remuneration, that the committee was the sole judge as to whether any, and, if so, what remuneration should be payable, and that the plaintiff, in consequence, should be non-suited (Taylor *v.* Brewer (1813), M. & S., 290). But if the employer has agreed to pay some remuneration, then the architect is entitled to be paid one that is reasonable (Bryant *v.* Flight (1839), 5, M. & W., 114).

The intervention of a condition will determine the time of or the right to payment; as in Moffat *v.* Dickson (supra), where payment depended on approval which was not given or as in Moffat *v.* Laurie (supra), where payment depended on the land being sold by the employer for building purposes, and the land was not so sold.

Should the employer who has entered into a contract with the architect for certain work refuse or neglect to proceed with such contract, the architect will then be able to sue for damages for the employer's breach of his contract, and the measure of his damages will be all the sums earned but not paid before the breach and all the future profits which it is reasonable to suppose he has lost because of the breach. In Farthing *v.* Tomkins (1893), 9 T.L.R., 566, an architect prepared plans for a hotel, but owing to the financial incapacity of the employer the proposed building was abandoned, and the architect, failing to obtain his fees, brought an action for them, and it was held that he was entitled to recover fair charges for the work which had been done.

In Prickett *v.* Badger (1856), (1 C.B.N.S., 296, and see Spratt *v.* Dornford, *Times*, December 1, 1862), it was held

Digitized by Google

that when an agent has done that for which he was employed, but the principal refuses or neglects to avail himself of the agent's work, the agent is entitled to sue for a reasonable remuneration for his work and labour, and in such a case a contract to pay what is reasonable is implied by the law; it is not a question for the jury.

The architect is not entitled to payment when his services have been unskilfully performed, or though skilfully performed, have proved to be of no use for the purpose for which he has been employed. Lord Ellenborough, C.J., laid down the legal principle in Farnsworth *v.* Garrard (1807), 1 Camp., N.P., 37, where he said that "the plaintiff is to receive what he deserves. If there has been no beneficial service there shall be no pay; but if some benefit has been derived, though not to the extent expected, this shall go to the amount of the plaintiff's demand, leaving the defendant to his action for negligence. The claim shall be co-extensive with the benefit." And Bayley, J., in Duncan *v.* Blundell (3 Stark 6), said: "When a person is employed in a work of skill the employer buys both his labour and his judgment; he ought not to undertake the work if it cannot succeed, and he should know whether it will or not; of course it is otherwise if the party employing him choose to supersede the workman's judgment by using his own." (See also Hill *v.* Fetherstonehaugh (1831), 7 Bing, 569, per Tindal, C.J., at p. 571, and Alderson, B., at p. 573; Bracey *v.* Carter (1840), 12, A and E., 373; and Hunt *v.* Wimbledon Local Board (1878), 4 C.P.D., 48, Bramwell B., at pp. 53 and 54.)

Where a professional man makes an estimate, which turns out to be incorrect to a considerable amount through his omitting to examine the ground for the foundations of the work, he is not entitled to recover anything for his plans, specifications, or estimates made for that work, for he is negligent either in not himself making the examination or in trusting to the inaccurate information of others. Whether he has used due diligence or not is a question for the jury, and if he went on the statements of others that is no excuse, as it is his duty to ascertain what are the facts or to report to his employer that he only goes on the information of others, or that the facts have not been ascertained. (Moneypenny *v.* Hartland (1824), 1 C. & P., 352, and see Whitty *v.* Lord Dillon, 2 F. & F., 67, and Nelson *v.* Spooner, 2 F. & F., 613.)

On the other hand, where the question of what is a reasonable sum to pay an architect on work done, *i.e.*, in a case where there is no express contract or the contract has been abandoned and he is suing on a *quantum meruit*, is under consideration, evidence may be given that an architect is a man of exceptional professional skill, qualification or experience, and if this is proved the reasonable fees should be higher than in the case of a person with less or inferior qualification, for it follows that if the employer has chosen a man known for his special degree of skill it is a fair presumption that he chose him for that reason, and that there was an implied undertaking to pay fees in some true proportion to the services expected. Moule, J., in Bird *v.* M'Gaheg (1849), 2 C. & K. (N.P.), 707, held that in an action for payment on a *quantum meruit*, where the plaintiff sued for a larger fee than had been tendered to him, evidence of skill, in order to show the reasonableness of the larger claim, was admissible.

The fact that an architect exercises his lien over his plans and detains them does not disentitle him to sue for the payment for the same, provided that he has given his employer reasonable facilities for inspecting and approving them. Nor is he unable to sue for and recover a proper price, even though he detained the plans when asking for a larger price. He is always entitled to recover for work, labour, and materials, on proof of the performance of the work and of the employer's having had a reasonable opportunity of inspection, for his contract is to perform the work satisfactorily and to give the employer a reasonable opportunity of inspecting and ascertaining its correctness. As soon as he has fulfilled this contract and can prove it he may maintain successfully an action for the debt without foregoing his lien (Hughes *v.* Lenny (1839), 5 M. & W., 183, 192, 193).

MESSRS. W. & T. R. MILBURN, FF.R.I.B.A., architects, of Sunderland, have prepared plans for rebuilding the Cardiff Empire Theatre at a probable cost of £38,000. The work is to be commenced immediately after Easter by the contractors, Messrs. E. Turner & Sons, of Cardiff.

ROYAL ACADEMY LECTURES: ARCHITECTURE.—IV.

THE final of the course of four lectures which Professor E. S. Prior, M.A., A.R.A., gave this year at Burlington House before the students of the Royal Academy was entitled

THE TWO ERAS OF FLEMISH PAINTING AND SCULPTURE.

In his opening remarks Professor Prior explained that he intended to deal with what, in any general history of the arts, is the outstanding distinction attaching to the fifteenth-century artists of the Low Countries, in that they recruited, or at any rate first conspicuously captained, the revolution of the arts—a revolution which has altered all the aspects of art right down to the present day. That is to say, the then conditions of art in Flemish cities first brought into being "artists" in our sense of the term—craftsmen who, to use the modern cant term, practise art for art's sake. To thirteenth-century sculptors or painters there had to be a necessity of practical use in every object of art; our present-day art in itself acknowledges no purpose of practical necessity, and is understood not to do so.

This organisation of sculptors and painters into a profession of artists was all of a piece with those organisations of stylists in architecture and furniture which gained a monopolist position. For the first time we find sculptors and painters, like Van Eyck, becoming men of consequence, or, as Memling, amassing fortunes and taking rank as wealthy citizens. The gist of the difference between this new estimate and that of mediæval art was that art had become in the fifteenth century clearly saleable, whereas in the thirteenth century it had no money value. Why? Because in the thirteenth century to every craftsman as his right were the magic power of beautiful creation, the style of beautiful creation, the practice of beautiful creation. Nowadays they are so very individual—this power, this style, and this practice. In the fifteenth century performers began to be picked out from the general body of artizans and employed by patrons like the Dukes of Burgundy, not as craftsmen, but as "artists" by repute. The National Gallery portrait which is called "Arnolfini and his Wife" is signed by J. Van Eyck; it is the only one of his pictures so signed, and the first modern picture attested by signature.

The accounting of personality as the merit of sculptor or painter was a new field of art. It was accompanied by significant changes in the vehicles by which they used their faculties. As to painting, there was what is called the discovery of the Van Eycks—the practice of using oil to give depth and brilliancy to colour beyond what could be got out of distemper painting. The use of oil had been known all through the Middle Ages; but what the Van Eycks brought into use was the method of mixing oil with their colours, so that they could be applied with a brush in the same way as tempera. Hitherto painting had been either manuscript illumination or wall decoration. But now the picture, as we call it, became possible—an article that could be a private possession and that could be a fancy subject outside the conditions of church service books or church wall. Portraits could be portraits not for any moral or religious use, but just for the joy of personal representation.

Turning to sculpture, we can see that a similar change in the technique or, as we may call it, the tactics of the sculptor rounded off the discovery that personal artistic genius could, ipso facto, equip the artist. No longer essentially conditioned as a building craftsman, he could undertake figures of objective interest; he had entered on that career of individual distinction by producing what we call, in auctioneer's phrase, an objet d'art. And straightway subject ceases to be of practical purpose for the sculptor: what is now of importance is the display of the powers of the artist. At the starting point of mediæval art the meaning, the symbolism, the religious instruction conveyed by the sculptural working of stone had made the whole purpose of the sculptor. To-day for our dilettante sculpture the meaning of the subject has no reality for the artist; only the manner of his handiwork has become the object of effort. Halfway was the distinct crisis in this long evolution, when in 1400 the Duke of Burgundy, for his Chartreuse at Champmol, instead of native craftsmen, engaged a whole set of personal artists from his newly acquired Flemish dominions. Quickly the collector of artists was to be succeeded by the collector of artists'

Digitized by Google

works. Collections of statues and pictures appear in the sixteenth century. A collection of works of art means each piece taken from its place: whereas the position of a work of art was that which made the purpose of it in the mediæval view.

Symbolic truth was the only real truth of nature to Byzantine and Romanesque artists. The ideal or universal appearance was the real truth to the thirteenth-century Gothic artist. To the fifteenth-century Flemish artist it was individual accidental reality that was true. To each age is its own view of truth; and just as natural and true, just as real as our present-day scientific realism, were Romanesque symbolism, Gothic ideality, and the Flemish naturalism or "lyrical realism." The truth of this lyrical emotion in things was so evident to men of the fifteenth century that for the next two hundred years the motives and settings of the Flemish realists passed into the imagination of North-Western sculpture and painting with the wide diffusive energy of a popular minstrelsy. Like a popular minstrelsy, it had two essential qualities; one was that of emotion, and the other of pageant. It was the display of a popular drama. Not introspective analysis, but active stage managing, was its Truth. It may fairly be said that when we stand before Flemish sculpture and pictures we are spectators, and the whole world of the fifteenth century is in array before us—a world of extraordinarily rapid and picturesque transformation scenes, a continuous pageant in which expressed itself the mediæval sense of splendid show that in every generation had been obtaining a deeper colouring.

The painting of the Flemish fifteenth-century masters discovered the secret of aerial perspective and used it for the first time since what is called the illusion painting of the Romans. Up to then representations of buildings and landscape had often been necessary as giving locality for the scenes and subjects painted on church walls or in the miniature of the illuminations. But such architecture or scenic backgrounds are pictorial devices to give atmosphere. It was the office of the fifteenth-century Flemish painters to make backgrounds part of the craft of representation. The furniture carvers had already introduced architectural details in the same way to give the sense of distance. The Van Eycks are reckoned as the earliest painters of panels in which this scheme of illusion was deliberately introduced into painting.

The middle of the sixteenth century was the crisis when the painting of great church walls was over, when paintings on church furniture were out of demand. The artist was now like Teniers—he paints a tavern scene and calls it "The Release of Peter," because in the corner is an angel and Peter. He had passed out of the service of mediæval dogma. But equally note, he had passed out of that of architectural ornament. He was become as free of material association as a poet or a musician, for whatever his subject it was the art of his handling that he practised, and that made the whole sum of this practice.

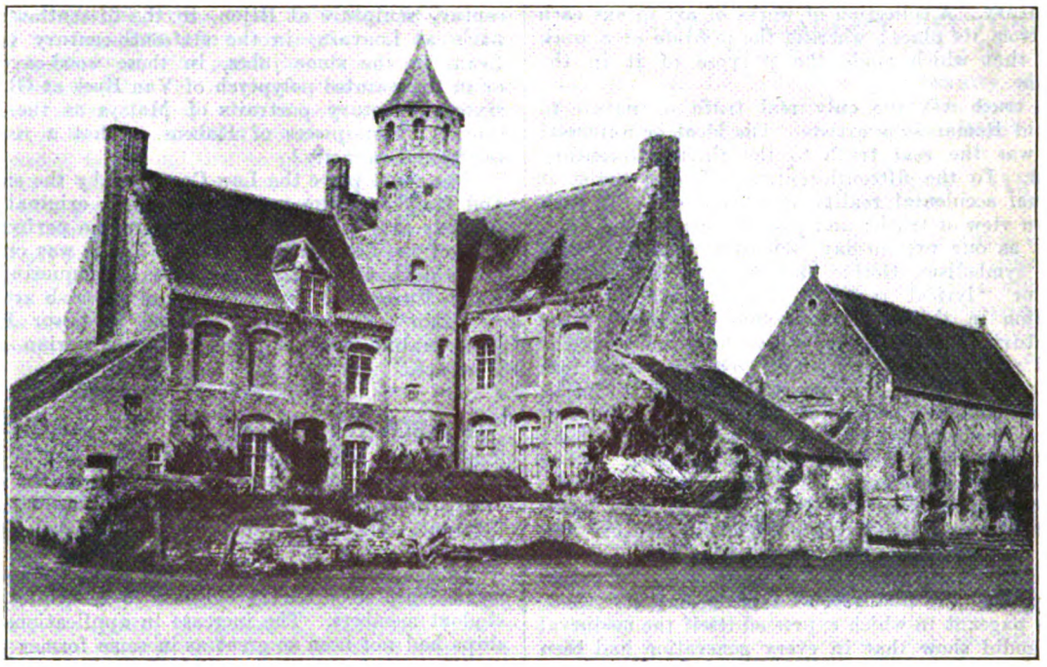
Just as pattern books promulgated the ornaments of architecture and made possible for anybody the Renaissance designs, so did the publication of engravings promulgate the pictorial art. But while in the old public uses of painting the colour was the essential value, the engraving gave to the public something else: that was line and mass composition. So accrued to the painting art not that which had been its emotion, but a new and more intellectual interest—that which lies in uncoloured composition, tone, distinction, values—art for art's sake.

Professor Prior, in summing up, said that in a general way in his lectures he had described Flemish style as the quality of richly executed furniture, the consummate craftsmanship of varied material for the purpose of splendid internal display. This, its strength of special quality, has been exhibited not monumentally, as in the Italian, nor architecturally, as in the French art. Even externally its buildings have a big sense of furnishing rather than of monumental disposition. Rather than monumental force, it has a picturesqueness as its note of composition; it has been strong in colour and in varied form; but it has always been a full-blooded picturesqueness, not a sentimental taste, but a virile practical passion of art. But human and natural as it has been, it is without the artistic coarseness of the German and without the homeliness of the English.

In Belgian art Flamand and Walloon have mixed their strains; and to picturesqueness and power of art we must add another factor. It is consummate craftsmanship that must be taken as the central abiding distinction of Flemish style, whether in the twelfth-century font at Liège, in the thirteenth-century relic chest at Nivelles, in the fourteenth-century sculpture at Dijon, in the fifteenth-century tabernacle at Louvain, in the sixteenth-century tabernacle at Leau, in the stone jubes, in those wood-carved retables, or in the painted polyptych of Van Eyck at Ghent. In the sixteenth-century portraits of Matsys as the seventeenth-century masterpieces of Rubens. What a record of dexterity and capacity!

One must place the Low Countries by the side of Greece and Italy to estimate the widespread origination of other people's arts that has been found in the perfect craftsmanship of the Low Country artist. For it was on the ground of its dexterity that his style was a conquering force. All North Europe followed the lead of Flemish art.

"Can such a history," asked Professor Prior, "and such qualifications, be ended by a barbarian invasion? I trow not."



GLASGOW INSTITUTE OF ARCHITECTS.

THE annual general meeting of the Glasgow Institute of Architects was held on the 3rd inst. in the hall of the Institution of Engineers and Shipbuilders, Elmbank Crescent. Mr. John Watson, F.R.I.B.A., President, in the chair.

In the report by the Council it was stated that the membership stood at 111 Fellows, 76 Associates, 48 lay and student members. The increase in applications for Fellowships had not been so great as in some former years, owing probably to the heavy financial demands caused by the war. The Council desired to place on record its appreciation of the hearty response made by members of the Institute to the nation's call for military and naval service. Two Fellows, five Associates, and seven student members were now serving with the Navy or the Regular and Territorial Forces of the country at sea, at home, in Belgium, or in France. In view of the number of students who had gone on military duty it was agreed to postpone for a year the competition for the Alexander Thompson Memorial Studentship, which was due to be held this year, and to allow those eligible now, but unable to compete, to do so in a year. In connection with the Architects' Special War Relief Fund promoted by the Royal Institute, the Council gave a donation of £50 from the Institute's funds, and this, together with the subscriptions from individual members of the Institute, amounting in all to £92 6*s.* 3*d.*, was forwarded to the R.I.B.A. Intimation was received that a sum of £700 had been collected by the R.I.B.A. for the fund, the allocation of which was in the hands of the Architects' Benevolent Society, and it was agreed that the Society should be allowed to deal with the contribution from this Institute. A local committee had at the request of the R.I.B.A. now been formed to deal with necessitous cases in the profession.

Mr. John Watson, F.R.I.B.A., the President, in moving the adoption of the above report, said that notwithstanding the war, which had severely crippled the private practices of individual members, the work of the Institute had been actively carried on, and its aims and objects steadily maintained. The various committees had been kept busy, especially the Practice Committee, which had been called upon to co-operate with the various architectural societies in Scotland, the Faculty of Surveyors of Scotland, and the various trade societies concerned, in the preparation of national modes of measurement and conditions of contract for building work in Scotland. The mode of measurement for wright work, which had just been issued, was the first fruits of their joint labours. The meetings had latterly been held under the Chairmanship of Sir George R. Askwith, K.C. At the first glance they might not quite like the new rules, seeking as these did to eliminate "after measurement" as far as possible. They had been long accustomed to this procedure, and considered it the best in the majority of cases. On the other hand, it was undoubtedly desirable that they should have uniformity of mode throughout Scotland. Their right to demand "after measurement" where advisable would again fall to be taken up in discussing conditions of contract. In future, contracts entered into with the intention of having no after measurement would of necessity require to be more matured before being proceeded with. On all the other points under discussion, the architects had much to congratulate themselves upon the principles upon which they laid stress having been accepted. There had been fewer competitions than formerly during the past year. It was pleasing to note that the advice of members in regard to

THE DUNES ABBEY.—BOGAERDE FARM.

conditions had usually been accepted, with a result which had proved satisfactory alike to promoters and competitors. In some cases the necessity of framing proper conditions of competition had induced promoters of small building schemes to place their work by direct commission and thus avoid competition—a procedure which had much to commend it. (Hear, hear.) It was hoped that members would loyally support the Council in their efforts in this direction. A committee had been formed to act in conjunction with the Architects' War Committee of the R.I.B.A., having as its object the providing of work for architects in necessitous circumstances. Fortunately, so far, the duties of the Local Committee had been practically nil. It was gratifying to know that within their province, architects, architects' assistants, and pupils, to the number of about sixty-seven, had responded to the nation's call for military and naval service.

The report was adopted, and office-bearers were afterwards elected.

BEHIND THE BELGIAN DUNES.

By John A. Randolph.

Hitherto the quiet little villages that abound in the Flemish plains along the coast from the Dutch frontier to the tiny corner of Belgium which that gallant little nation can still call its own have been known to comparatively few of our countrymen; but now their names are household words on our lips, and the villages have leapt into a fame that will last for all time—a fame even greater than some of them earned, for instance, in the "Battle of the Dunes" of long ago.

The greater part of the new "Battle of the Dunes" has been raging on the southern side of Ostend—an architecturally more interesting part of the plains than that to the northward, which includes the better examples of ecclesiastical architecture of the district, such as Blankenberghe, Wenduyne, Lisseweghe, Vlissighem, Nieuwmunster, Dudzeele, Knocke, Ramscapelle, and Pervyse. East of Ostend are Jabbeke, Plasschendaele, and Oudenburg. South of Ostend the architecture is also very interesting, and the light railway, or "Vicinal," passes among perhaps the best of it, the churches, however, as a rule, being plain and, in a number of cases, red brick Renaissance, but with bold, simple towers "standing four square to the winds of heaven."

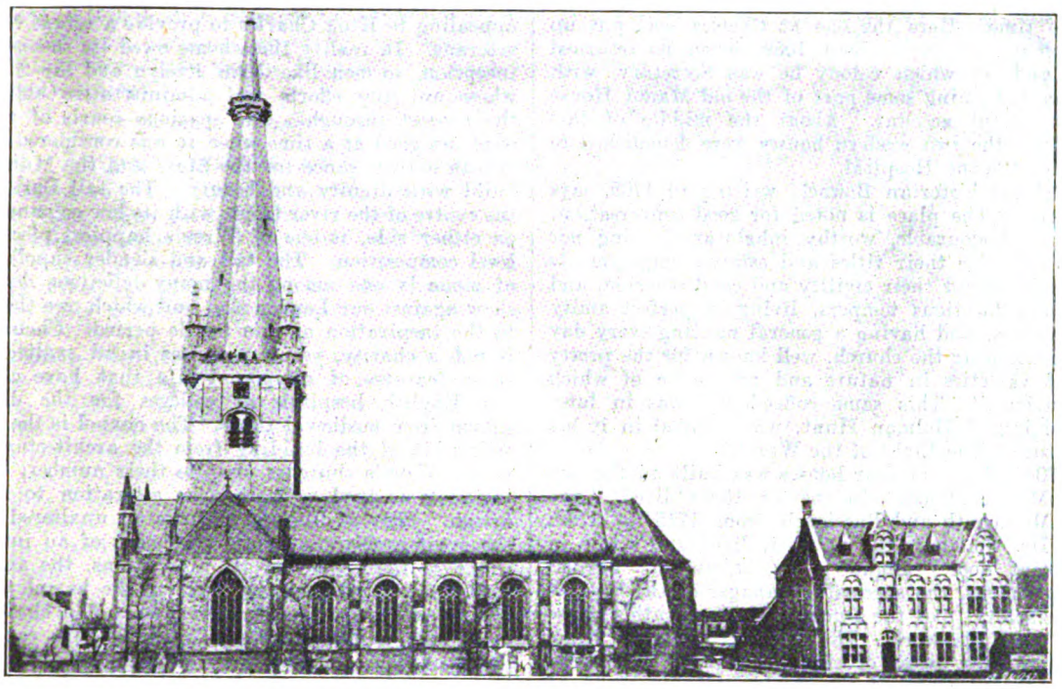
Lombartzyde, the scene of so much fury, was originally a Germanic settlement of the Longobards and possessed a port of some size, which, however, was destroyed as long ago as the twelfth century by the incursion of the sea in a great storm—when the Zuyder Zee was also formed by it—when the inhabitants fled to a spot now known as Nieuport, and founded that town and made the port.

The church is attractive and contains a statue of the Madonna which the local fisherfolk have long held in veneration.

Between this village and Westende—a proverbial stone's throw away towards Ostend—the great "Battle of the Dunes" was fought in 1600, the Spaniards, under Archduke Albert, suffering defeat at the arms of the Dutch led by Maurice of Orange.

St. Georges' main attraction—from a non-military standpoint—is a fairly large country house, with one or two wings and, on the courtyard front, a bold octagonal turret, quite plain except for a square window on four of its sides, but its low pointed roof curiously crowned with a large pear-shaped slate-covered spirelet. The effect is rather grotesque, but, taken all in all, a happy touch of picturesqueness is given to the irregularly planned house. There is little else worthy of any count in this scattered hamlet. Now, of course, the "ferryman's house" of the war despatches has become as important as the "La Belle Alliance" at Waterloo. St. Georges is so near Nieuport that, notwithstanding the publishers of the picture cards of the Tour de St. Georges, it properly belongs to the Nieuport district, and not to the environs of Dixmude, as they say it does.

Near at hand is Ramscapelle which had, till early this year, a small Gothic church, of which only the roofless and windowless shell remains as a result of the German attack on it in their attempt to "hack a way through" to Calais.



Pervyse, whose church is ruined also, lies five miles further inland.

South of Nieuport and Oostduinkerke (the rising pleasure resort and formerly a poor little village known only to a few artists) lies Coxyde, a picturesque fisher village, at the outskirts of which, towards La Panne, formerly stood one of the greatest abbeys of Flanders—the Abbaye des Dunes—founded in 1109 by St. Leger, which was destroyed in 1566 by the Iconoclasts, the monks (Cistercians) fleeing to the De Bogaerde farm (of which we give a view). Eventually they built a new abbey at Bruges—now known as the Grand Séminaire—in 1625.

Adinkerk nestles along the banks of the canal a few miles nearer France—the last village in Belgium—and its simple church has the prevailing heavy tower with octagonal equilateral roof, the whole picture being one of great charm and peacefulness.

Jabbeke, Plasschendaele, and Oudenburg do not call for very special mention, though Plasschendaele is the boldest and best of them, and Jabbeke is good. Ghistelles also, between Bruges and Ostend, has recently come into new prominence, but it is also known architecturally for its spacious brick Gothic church and lofty tower, lately sur-

GHISTELLES.—THE CHURCH, SHOWING NEW SPIRE.

mounted by an enormous spire in bright yellow brick. It has a miraculous fountain outside the north aisle in the wall protected by an ugly iron railing, and the brief history thereof and of the Priory that was erected near is not without interest, but too long for these columns.

Between Ghistelles and Bruges, however, and close to that city, is the stone church of Varssenaere, with an octagonal stone central tower surmounted by a huge stone crocketted spire, the top of which was broken off by lightning and a small conical roof put on when repaired, with ludicrous effect. The church is small comparatively for such a steeple, but it is well worth a visit when the enemy has been driven out of the country.

CHELSEA ANTIQUITIES.

An illustrated lecture was given under the above title at Carpenters' Hall last week by Mr. Walter H. Godfrey. In his introductory remarks he said he wanted to show that the past is still living in this riverside parish, which has only lately surrendered to London and even now cherishes an individuality to which its history gives it just title.
